federal register

Wednesday
November 27, 1991

FEDERAL REGISTER Published daily, Monday through Friday, (not published on Saturdays, Sundays, or on official holidays), by the Office of the Federal Register, National Archives and Records Administration, Washington, DC 20408, under the Federal Register Act (49 Stat. 500, as amended; 44 U.S.C. Ch. 15) and the regulations of the Administrative Committee of the Federal Register (1 CFR Ch. I). Distribution is made only by the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402.

The **Federal Register** provides a uniform system for making available to the public regulations and legal notices issued by Federal agencies. These include Presidential proclamations and Executive Orders and Federal agency documents having general applicability and legal effect, documents required to be published by act of Congress and other Federal agency documents of public interest. Documents are on file for public inspection in the Office of the Federal Register the day before they are published, unless earlier filing is requested by the issuing agency.

The seal of the National Archives and Records Administration authenticates this issue of the **Federal Register** as the official serial publication established under the Federal Register Act. 44 U.S.C. 1507 provides that the contents of the **Federal Register** shall be judicially noticed.

The **Federal Register** will be furnished by mail to subscribers for $340 per year in paper form; $195 per year in microfiche form; or $37,500 per year for the magnetic tape. Six-month subscriptions are also available at one-half the annual rate. The charge for individual copies in paper or microfiche form is $1.50 for each issue, or $1.50 for each group of pages as actually bound, or $175.00 per magnetic tape. Remit check or money order, made payable to the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402, or charge to your GPO Deposit Account or VISA or Mastercard.

There are no restrictions on the republication of material appearing in the **Federal Register.**

How To Cite This Publication: Use the volume number and the page number. Example: 56 FR 12345.

Rules and Regulations

Federal Register
Vol. 56, No. 229
Wednesday, November 27, 1991

This section of the FEDERAL REGISTER contains regulatory documents having general applicability and legal effect, most of which are keyed to and codified in the Code of Federal Regulations, which is published under 50 titles pursuant to 44 U.S.C. 1510.
The Code of Federal Regulations is sold by the Superintendent of Documents. Prices of new books are listed in the first FEDERAL REGISTER issue of each week.

DEPARTMENT OF AGRICULTURE

Food and Nutrition Service

7 CFR Parts 271, 272, 275 and 277

[Amdt. No. 328]

RIN 0584-AA76

Food Stamp Program: Miscellaneous Quality Control Provisions of the Hunger Prevention Act of 1988

AGENCY: Food and Nutrition Service, USDA.

ACTION: Final rule.

SUMMARY: On January 31, 1991 (56 FR 3788) the Department of Agriculture published proposed changes to Food Stamp Program regulations based on section 320, section 602, and parts of section 604 of the Hunger Prevention Act of 1988 (Pub. L. 100–435, enacted September 19, 1988). Section 320 requires changes in the corrective action planning State agencies must complete because of quality control (QC) errors. Section 602 requires State agencies to pay interest on unpaid QC related claims assessed against State agencies with payment error rates which exceed an established tolerance level. The portions of section 604 which were addressed involve the Food Stamp Act provisions relating to enhanced funding (an increased Federal share of program administrative costs), and QC liabilities (the sharing of costs of payment error by State agencies with error rates which exceed a national error tolerance level). In addition, the proposed rule addressed the issue of Federal sample sizes in QC, and certain technical changes in regulations related to State agency QC sampling. This final rule addresses significant comments received in response to the regulatory changes proposed in the rule published January 31, 1991.

EFFECTIVE DATE: Section 701 of Public Law 100–435 sets effective dates for the various provisions of Public Law 100–435 addressed in this rule. The provisions contained in 7 CFR 271.2, 275.10(a), 275.16(b)(2), 275.23(c), 275.23(e)(2), (3), (4), and (9) were effective October 1, 1985. The provisions contained in 7 CFR 275.1(b), 275.23(d), and 277.4(b) of this rule were effective October 1, 1988. The provision contained in 7 CFR 275.16(b)(6) was effective July 1, 1989.

The provisions contained in 7 CFR 275.11 (a), and (b) are effective December 27, 1991. The provisions contained in 7 CFR 275.3(c) are effective December 27, 1991, and applies to review periods starting with the Fiscal Year 1991 review period. The provisions contained in 7 CFR 275.23(e)(7) are effective December 27, 1991. The provisions contained in the implementing paragraph at 7 CFR 272.1(g) including those provisions relating to the arbitration of underissuance cases are effective December 27, 1991.

FOR FURTHER INFORMATION CONTACT: John Knaus, Chief, Quality Control Branch, Program Accountability Division, Food and Nutrition Service, USDA, Alexandria, Virginia 22302, (703) 305–2472.

SUPPLEMENTARY INFORMATION:

Classification

Executive Order 12291/Secretary's Memorandum 1512–1

This action has been reviewed under Executive Order 12291 and Secretary's Memorandum No.1512–1. Betty Jo Nelsen, Administrator of the Food and Nutrition Service (FNS), has classified this rule as non-major. The rule's effect on the economy will be less than $100 million. The rule will have no effect on costs or prices for consumers, individual industries, Federal, State or local government agencies, or geographic regions. It will not have significant adverse effects on competition, employment, investment, productivity, innovation, or the ability of United States-based enterprises to compete with foreign-based enterprises in domestic or export markets.

Regulatory Flexibility Act

This action has been reviewed with regard to the requirements of the Regulatory Flexibility Act of 1980 (Pub. L. 96–354, 94 Stat. 1164, September 19, 1980). Betty Jo Nelsen, Administrator, FNS, has certified that this rule does not have a significant economic impact on a substantial number of small entities.

Paperwork Reduction Act

One of the provisions of this rule modifies the required contents for QC sampling plans. 7 CFR 272.2 requires each State agency to submit a QC sampling plan as part of the annual update of its State Plan of Operations (OMB authorization number 0584–0083). The reporting burden for this collection of information is estimated to average 10 hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. The modifications made by this rule eliminate some superfluous sampling plan requirements for State agencies that do not employ alternative sample designs. For State agencies that do employ alternative sample designs, the modifications simply clarify current requirements. The modifications will not change the average reporting burden of 10 hours per response for a State agency to prepare annual updates to its State Plan of Operations as approved under 0584–0083.

No other provisions of this rulemaking contain reporting or recordkeeping requirements subject to approval by the Office of Management and Budget under the Paperwork Reduction Act of 1980 (44 U.S.C. 3507).

Executive Order 12372

The Food Stamp Program (Program) is listed in the Catalog of Federal Domestic Assistance under No. 10.551. For the reasons set forth in the final rule at 7 CFR 3015, subpart V and related notice (48 FR 29115, June 24, 1983), this Program is excluded from the scope of Executive Order 12372 which requires intergovernmental consultation with State and local officials.

Background

On January 31, 1991 (56 FR 3788) the Department of Agriculture (Department) proposed regulations to amend the food stamp QC system, primarily based on mandatory changes contained in the Hunger Prevention Act of 1988, Public Law 100–435, enacted September 19, 1988. In addition to the changes that

were mandated by Public Law 100–435 the Department proposed several minor changes related to the QC system. These changes included technical changes to the requirements for State agency sampling plans, and the required federal sample sizes in situations where State agencies had not completed their originally estimated required number of active QC reviews, or had implemented changes in their sampling plans without informing FNS. A full explanation of the rationale and purpose of these regulatory changes was provided in the preamble of the proposed rulemaking. This preamble deals with significant issues raised by commenters and the changes made as a result of their comments. It is recommended that the reader reference the proposed rulemaking, as well as this final rulemaking for a more complete understanding of the regulatory changes that the Department is implementing. The Department received 22 comment letters concerning the proposed rule.

Definitions—Section 271.2

Three organizations provided comments on the proposed regulatory changes to § 271.2 regarding definitions. Two commenters were concerned that the proposed definition for "overpayment error rate" was expressed as a percentage, and the definition for "underpayment error rate" was expressed as a ratio. These commenters recommended that the methodology for computing the overpayment and underpayment error rates be aligned. In addition, these commenters felt that it was inappropriate for the overpayment and underpayment error rates to be computed separately and then combined to create the payment error rate. One of the commenters has suggested that the denominator of the overpayment and underpayment error rates should be redefined as the sum of the value of all allotments issued plus the value of all allotments underissued in order to more precisely assess overall payment accuracy. The Department is unable to consider the suggested changes to the proposed regulations since the proposed regulatory provisions are specifically mandated by the law. Public Law 100–435, section 604 provides specific language for the definitions of "overpayment error rate", "underpayment error rate", and "payment error rate".

One commenter recommended changes to the definition of "underissuance" which would have eliminated from the definition any cases in which the underissuance was caused by a food stamp recipient's failure to report changes in household circumstances. It should be noted that although the Department has proposed adding a new definition to describe "underpayment error rate", no proposal to change the definition of "underissuance" has been made. Inasmuch as no change to the definition of "underissuance" was proposed in the regulations published January 31, 1991 (56 FR 3788) the Department deems it inappropriate to consider any change in this area as a part of this final rulemaking. In addition, the House of Representatives Committee on Agriculture Report (Report 100–828) states, in part, "* * * the Committee took into consideration a number of additional concerns that had been raised about the system currently in place. Among the concerns that were not directly addressed in this legislation were * * * (3) the appropriate response to the distinction between errors that the State agencies can correct and those that are most difficult to influence (the so-called client/agency definition) * * * The legislation as a whole, particularly the higher tolerance levels, incorporates implicit relief if problems such as those listed above that have in the past made it difficult for States to achieve the national error rate goal."(H.R. Report No. 100–828, part 1, 100th Cong., 2nd Sess., 37). Based on this expression of Congressional intent, the Department is retaining the current definition of "underissuance".

Federal Sample Size—Section 275.3

A total of ten organizations provided comments on the proposed regulatory changes to § 275.3 regarding Federal sample size. Six commenters disapproved of the proposed change arguing that anything less than the currently required Federal sample sizes would result in a less accurate, and possibly statistically invalid Federal validation review of a State agency's QC system. The matter of accuracy and consistency was of particular concern to these commenters because the tolerance level for QC fiscal liabilities is based on the national performance measure, which is in turn, based on the Federally regressed Payment Error Rates of all State agencies for a given fiscal year. In general, the commenters concerned with accuracy made the argument that any decrease in the number of cases in the Federal sample would reduce the statistical precision of the Federal regressed error rate. The commenters concerned with consistency made the argument that without a specific formula to be followed in situations where a State agency had failed to complete its originally estimated required number of reviews or had made changes in its sampling plan without informing the FNS Regional Office, that Regional Office QC staffs could apply the provisions for a smaller sample size in a manner that was inconsistent from Region to Region, or even from State to State within a single Region. The Department has considered the comments concerning accuracy but has not adopted them. While the commenters argue that a less accurate statistical precision may result from the use of a smaller Federal sample, it should be recognized that it is within the power of the State agencies to avoid this possibility by completing their originally estimated required number of reviews, and informing the appropriate FNS Regional Offices of any changes in their sampling plans. The Department is not attempting to penalize State agencies through this regulatory change. This change is only meant to enable the Department to resolve situations which are beyond the control of the Department. The concerns relating to consistency are addressed with the comments relating specifically to the need for a formula to be applied in these situations.

Two commenters endorsed the proposed regulatory change, but indicated a need for some formula to establish the minimum required Federal sample size. Three other commenters disapproved of the change specifically because no formula was included in the proposed regulatory language. The Department has considered these comments, along with the concerns regarding consistency, and decided to adopt them. In proposing this regulatory change it was not the intent of the Department to remove all Federal sample size requirements in situations where a State agency had failed to complete its required number of reviews or had made changes in its sampling plan without informing the FNS Regional Office. The Department has added language to the regulations to indicate that any shortage in the Federal sample will be based on the magnitude of the State agency's failure to complete its originally estimated required number of cases. Essentially this will mean a proportional reduction in sample sizes as suggested by one of the commenters. For example, if a State agency's sample size is 1200, the Federal sub-sample is 400, and the Federal selection interval is 3 (1200/400). If the State agency completes only 1000 cases, the Federal sample selected would be only 333 cases (1000/3). The shortfall that would be allowed for the Federal sample would be 67 cases (the 200 cases the State agency failed to complete divided by the

Federal sampling interval of 3 (200/3)). This will make the Federal shortfall proportionate to the State agency's shortfall (200/1200 or 16.66% vs. 67/400 or 16.75%).

State Agency Sampling—Section 275.11

Three organizations provided comments on the proposed regulatory changes to § 275.11 regarding State agency sampling plans. One commenter has pointed out that the proposed regulatory language would still require State agencies with integrated sampling designs to document all the criteria to be met for alternate sampling designs. This commenter argues that most State agencies have been integrating samples for years, and it would be a waste of effort for these State agencies to annually address the four criteria that apply only to alternative sample designs. The Department has considered this comment and decided to adopt it. The final regulatory language specifies that only State agencies proposing sampling plans with non-proportional integrated sampling, or alternative sampling designs must document compliance with the approval criteria in paragraph (b)(4) of this section.

One commenter disapproved of the proposed change. This commenter felt that it was good statistical practice to detail and document the four criteria in question for all sampling plans, not just those plans employing an alternative design. The Department has considered this comment but decided not to adopt it. For State agencies employing systematic or simple random sampling plans the four criteria do not apply. For example, it is impossible for a State agency to demonstrate a precision which is equal to or better than the precision of systematic sampling if it is using a systematic sampling plan. Similarly, it is impossible to describe weighting procedures for a systematic or simple random sampling plan which does not employ weighting. One commenter felt that requiring State agencies to explain their procedures, even if a systematic or simple random design is used, would help ensure that QC staff are in fact knowledgeable about statistical theory and data systems management procedures. For this reason, this commenter recommended that the four criteria not be eliminated from any sampling plans. The Department has considered this comment but decided not to adopt it. As already indicated, the four criteria do not apply to systematic and simple random sampling plans. If State agencies employing these plans wish to have their statistical staffs address these four criteria as a training exercise, the regulations will not prohibit this practice.

Corrective Action Plans (CAPs)—Section 275.16

A total of seven organizations provided comments on the proposed regulatory changes to § 275.16 regarding Corrective Action Plans (CAPs).

State Agencies Not Entitled to Enhanced Funding

Four commenters opposed the proposed change in regulations at 7 CFR 275.16(b)(2) to require the development of a CAP by any State agencies that did not qualify for enhanced funding. In general, these commenters felt that CAPs should not be mandated in situations where State agencies did not exceed the tolerance level for fiscal sanctions (lowest ever national average payment error rate plus 1 percent). The Department is unable to consider any suggested changes to the proposed regulations which are specifically mandated by the law. Public Law 100–435, section 604 specifically mandates that "the Secretary shall foster management improvements by the States pursuant to subsection (b) by requiring State agencies other than those receiving adjustments under subparagraph (A) (related to enhanced funding) to develop and implement corrective action plans to reduce payment errors".

Systemic Problems Resulting in Underissuances, or Improper Denials and Terminations

The comments from the other three organizations relating to the proposed regulatory changes regarding CAPs dealt specifically with the Department's proposal to require the development of a CAP in situations where underissuances, or improper denials/terminations are the result of State agency practices, rules, or procedures which are inconsistent with the Food Stamp Act, or regulations and policies of the Secretary. One commenter pointed out that Public Law 100–435, section 320 does not specifically mandate the development of a corrective action plan in these situations, only that steps be taken to prevent a recurrence of such errors. This commenter, along with one other, suggested that if CAPs were going to be required for systemic problems, that the regulations more clearly define what constitutes a systemic problem, and that standards be developed to determine when a CAP would be needed. It was suggested, as an example, that CAPs only be required if systemic problems resulted in a negative error rate of one percent or more, and/or an underissuance error rate of two percent or more. The Department has considered these comments but decided not to adopt them. Public Law 100–435, section 320 states, in part, that State agencies "shall take other steps to prevent a recurrence of such errors where such error was caused by the application of State agency practices, rules or procedures inconsistent with the requirements of this (Food Stamp) Act or with regulations or policies of the Secretary issued under the authority of this Act." While Public Law 100–435 does not specifically require the development of a CAP in order to prevent a recurrence of such errors the Department deems corrective action planning to be the most suitable method of insuring that appropriate efforts are taken to correct systemic problems. In regards to the suggestion that systemic errors be defined to include standards such as a negative error rate of one percent, and/or an underissuance rate of two percent, the Department deems it inappropriate to apply such standards in situations where Food Stamp Program recipients are being harmed, through the loss of benefits, due to the rules, practices, or procedures of the State agency. In such situations the Department considers it important that corrective action be taken, regardless of the number of recipients or magnitude of the errors involved.

One commenter has recommended that the CAPs for systemic problems be kept simple, rather than requiring the usual detailed narrative and statistical analysis that typically is part of a CAP. The Department notes that the content requirement for CAPs is specified in 7 CFR 275.17(b). In the case of systemic problems, the CAPs need only be as detailed as is necessary to meet the basic requirements contained in that section of the regulations.

Determination of State Agency Program Performance—Section 275.23

National Payment-Error Tolerance Level/State Agencies Subject to Liabilities

A total of twelve organizations provided comments on the proposed regulatory changes to § 275.23(e) regarding the establishment of a national payment-error tolerance measure, the determination of payment error rates, and the calculation of QC liability claims. One commenter endorsed the establishment of a category not subject to either liabilities or enhanced funding. Four commenters objected to the proposed tolerance level as a basis for establishing QC liabilities.

Two of these commenters acknowledged that the proposed provisions are required in Public Law 100–435, but objected anyway. The other two commenters proposed that the tolerance level be the national average for each year plus 1 percent (rather than the lowest national average ever achieved), or that separate tolerance levels be established for each State agency. The Department is unable to consider the changes suggested by these comments. Public Law 100–435, section 604 mandates, in part, that "(t)he announced national performance measure shall be used to establish a payment-error tolerance level. Such tolerance level for any fiscal year will be one percentage point added to the lowest national performance measure ever announced up to and including such fiscal year under this section. The payment-error tolerance level shall be used in determining the State share of the cost of payment error * * *".

One commenter objected to QC liabilities being based on total food stamp issuance in a State rather than on administrative funding. The Department is also unable to consider this suggestion. Public Law 100–435, section 604 mandates, in part, that "the State agency shall pay to the Secretary an amount equal to its payment error rate less such tolerance level times the total value of allotments issued in such a fiscal year by such State agency."

Two commenters were concerned that once established, the National Performance Measure for a given fiscal year is not subject to change, although individual State agency payment error rates are subject to change as a result of arbitration or correction of computational problems. These commenters felt that either the deadline for announcing the national performance measure should be extended, or that FNS should be required to complete all arbitrations prior to the announcement of the national measure, even if it meant agreeing with the State agency's position by default. The Department has considered these comments but has not adopted them. Sections 16(c)(5) and (6) of the Food Stamp Act mandate that the Department determine State agencies' payment error rates, announce a national performance measure based on these error rates, and notify the State agencies of these rates within nine months following the end of each fiscal year (June 30). Because it is legislatively mandated that FNS make its announcement no later than June 30 each year the Department cannot consider the suggestion that the deadline for announcing the national performance measure be extended. In the matter of arbitration decisions, the Department recognizes that State agency error rates, and subsequently, the national average, may change as a result of arbitration decisions arrived at after the deadline for announcement of the national performance measure. However, it is anticipated that the number of such cases will be small. In addition, it should be recognized that any arbitration decisions made after the announcement of the national performance measure which uphold a State agency's position would tend to lower the State agency's payment error rate, and subsequently, the national average. Thus, a national performance measure subject to change after its announcement, would create a lower, and possibly more difficult to achieve payment-error tolerance level. Despite the fixed nature of the national performance measure, arbitration decisions subsequent to the announcement will continue to be incorporated into the State agencies' final payment error rates and the determination of any QC claim assessed against a State agency.

Three commenters have argued that the error-rate estimation procedures that FNS currently uses in determining the payment error rate, and has proposed to use in determining the redefined payment error rate, are inaccurate, and have made recommendations for alternative procedures. The Department has considered these comments but has not adopted them. The Department believes that the current procedures are statistically sound. As indicated in the preamble of the proposed rulemaking, extensive research has demonstrated that the Department's error-rate estimation procedures produce statistically valid results (Morris Hansen and Benjamin Tepping, A Statistical Evaluation of Food Stamp Quality Control (1987)).

One commenter disagrees with the use of point estimates of sampling to define and determine the payment error rate. Another commenter objects to the overissuance and underissuance error rates being regressed separately, and then combined to determine a State agency's payment error rate. The Department is unable to consider these suggested changes. Public Law 100–435, section 604 provides specific language for the definitions of "overpayment error rate", "underpayment error rate", and "payment error rate" including the use of the point estimates, and the fact that the payment error rate is the sum of the separately determined overpayment and underpayment error rates. The Department is unable to consider any suggested changes to the proposed regulations which are specifically mandated by the law.

One commenter disagreed with the method FNS uses to adjust an error rate to compensate for nonsampling errors. It should be noted that although the Department proposed a technical change in the regulatory language so that the narrative description of the non-completion adjustment would be replaced with the equivalent calculation formulas, no proposal was made to change the actual procedures. Inasmuch as no change to the procedures for adjusting for non-completion has been made or proposed, the Department deems it inappropriate to consider any change in this area as a part of this final rulemaking.

State Agencies Entitled to Enhanced Funding

A total of six organizations provided comments on the proposed regulatory changes to § 275.23(d)(2) regarding entitlement to enhanced administrative funding. One commenter argued that a payment error rate of 6 percent was too low a benchmark to set in order to qualify for enhanced funding. Two commenters disapproved of the proposed provision that a State agency's payment error rate must be at least one full tenth of a percentage point under six percent (at least 5.90 percent), with enhanced funding increasing in distinct one percent increments for each full tenth of a percentage point below the 5.90 percent level, before qualifying for enhanced funding. The Department is unable to consider these suggestions to amend the proposed rule. Public Law 100–435, section 604 mandates, in part, that "the Secretary shall adjust a State agency's federally funded share of administrative costs * * * by increasing such share of all such administrative costs by one percentage point to a maximum of 60 percent of all such administrative costs for each full one-tenth of a percentage point by which the payment error rate is less than 6 percent, * * * ".

Four comments concerned the stipulation in the proposed regulations that a State agency must have a negative case error rate that is less than the national weighted mean negative case rate for the prior fiscal year in order to qualify for enhanced funding. One commenter felt that there should be no requirement to meet goals for the negative error rate in order to qualify for enhanced funding. The Department is unable to accommodate these commenters because Public Law 100–

435, section 604 mandates, in part, that "only States whose rate of invalid decisions in denying eligibility is less than a nationwide percentage that the Secretary determines to be reasonable shall be entitled to the adjustment prescribed in this subsection (enhanced funding)".

One commenter stated that the national weighted mean negative case rate has never been established or described, and requested a description of how the rate is determined. One commenter wanted justification for why the proposed procedures use the national weighted mean average as the benchmark for enhanced funding. The national weighted mean negative case rate is a weighted average of the actual individual State agency reported negative case error rates. The weights are based on estimates of the States' average monthly negative case caseloads that are subject to review. The national weighted mean negative case rate is calculated and reported each year by the statistical staff of the FNS National Office. With respect to the use of the national weighted mean negative case rate as a benchmark for enhanced funding the Department notes that this rate was first placed into regulations as a target goal for enhanced funding in an interim rulemaking published May 27, 1983 (48 FR 23797). Since this rate has been used as a target for the qualification for enhanced funding since Fiscal Year 1983, it should be familiar to all State agencies by this time. Following concerns expressed by State agencies that using the rate for the same fiscal year in which the State agencies were trying to qualify for enhanced funding did not provide a quantified target known in advance of the review period, the Department changed the goal to the national weighted mean negative error rate for the prior fiscal year in the final rulemaking published on February 17, 1984 (49 FR 6292). The Department deems the national weighted mean negative error rate for the prior fiscal year to be a reasonable, equitable benchmark for entitlement to enhanced administrative funding for which the goal will be known in advance and yet is related to standards met by many State agencies. In addition, the House of Representatives Committee on Agriculture Report (Report 100–828) states, in part, "* * * the Committee expects the Secretary to continue the current method of setting the standard for invalid denials and terminations that is used in determining eligibility for enhanced funding until any legislated changes occur following the completion of the study mandated elsewhere in this section." (H.R. Report No. 100–828, part 1, 100th Cong., 2nd Sess., 33). Based on this expression of Congressional intent, the Department is retaining the national weighted mean negative error rate for the prior fiscal year as the benchmark for entitlement to enhanced administrative funding.

One commenter addressed the review procedures for a specific group of negative cases. While the Department deems it inappropriate to address this comment as part of this rule (since no proposal to change the review procedures on negative cases has been made) it will consider the comment when examining proposals to revise negative case review procedures. This review is currently underway.

Interest Charges

A total of eight organizations provided comments on the proposed regulatory changes to § 275.23(e)(9) regarding interest charges.

One commenter opposed all aspects of the statutory provisions and regulatory proposals concerning interest charges. Four commenters opposed the proposal to begin charging interest (if a State agency is appealing the claim) from the date of the decision on the administrative appeal, or 2 years after the date the bill for the claim is received, whichever is earlier. These commenters felt that the collection of interest for a period prior to the completion of the administrative appeal process was inequitable. The Department is unable to consider these suggested changes in the proposed rule. Public Law 100–435, section 602 mandates the imposing of interest on QC claims, and in part, specifically requires that "If the State agency appeals such claim (in whole or in part), the interest on any unpaid portion of the claim shall accrue from the date of the decision on the administrative appeal, or from a date that is 2 years after the date the bill is received, whichever is earlier, until the date the unpaid portion of the payment is received."

Two commenters expressed concern that the interest provisions would provide incentive for State agencies to resolve QC claims rapidly, but would provide no such incentive to the Federal government to resolve these claims. It should be stressed that Public Law 100–435, section 602 specifies that if a State agency pays a claim at any time during the appeal process, and the claim is subsequently overturned through administrative or judicial appeal, that the amount paid would be returned, together with interest accruing from the date of payment to the date it is returned. The Department anticipates that some State agencies may pay QC claims, while continuing to pursue an appeal, in order to avoid the possibility of interest payments. In such cases the Federal government would be required to pay interest to State agencies which eventually won their appeals. The Department would therefore have an incentive to see a speedy resolution to claims.

One commenter was concerned that the proposed regulations did not address any requirements on the part of State agencies to report interest accrued on QC claims, nor go into specifics on how it should be reported, verified, and monitored. The Department does not anticipate any requirements on the part of State agencies to report, verify, or monitor interest accrued on QC claims. The Financial Management staffs of the servicing finance offices currently responsible for the billings of QC claims (the FNS Regional Offices) shall be responsible for the collection of interest.

One commenter felt that State agencies and the general public have a right to know how indebtedness to the Federal government will be calculated, and that the methodology used to calculate the interest should be specified in the regulatory language rather than explained in the "Background" section. The Department has adopted this suggested change in the proposed rule. The methodology to be used in calculating interest has been included in the regulatory language at 7 CFR 275.23(e)(9)(iii) in this final rule.

Claims Collection

A total of three organizations provided comments on the proposed change in regulatory language at 7 CFR 275.23(e) regarding the payment of QC liability claims. The current wording of the regulations specifies that "FNS shall reduce the money it pays for the State agency's Food Stamp Program administrative costs * * *" in order to collect a QC claim. The Department has proposed to change this language to "the State agency shall pay or have its share of administrative costs reduced * * *" in order to collect a QC claim. One commenter endorsed the proposal to allow alternative methods of payment for QC liability claims. One commenter has expressed concern over the statement in the preamble to the proposed rule indicating that the Department retains the authority under section 13(a)(1) of the Food Stamp Act to reduce administrative funding in order to collect unpaid claims assessed against State agencies (56 FR 3792). This commenter interpreted this statement as

an attempt on the part of FNS to assert authority to collect a QC claim prior to the completion of any administrative or judicial appeal of the claim. This commenter is mistaken as to the Department's intentions regarding QC claims collections, as addressed in the proposed rulemaking. Contrary to the commenter's concern, it is the Department's intention to only address the method of collection, not when the collection would be made as part of these rules.

One commenter was concerned that FNS retains ultimate authority to reduce administrative funding. The commenter saw this as meaning that any time FNS did not like an alternative method of payment proposed by a State agency FNS could unilaterally reject the alternative method and withhold administrative funding to collect a QC claim. This commenter proposed the use of an arbitrator to intervene when FNS and a State agency could not arrive at a mutually agreed upon alternative method of payment. The Department has considered this comment but has not adopted it as it would be in conflict with the provisions of the Food Stamp Act which specifies in section 13(a)(1) that "(t)he Secretary shall have the power to reduce amounts otherwise due to a State agency under section 16 of this Act to collect unpaid claims assessed against the State agency if the State agency has declined or exhausted its appeal rights under section 14 of this Act".

Arbitration for Underissuance Cases

A total of three organizations provided comments on the proposal to allow a 60 day period of time for State agencies to request arbitration of any federally subsampled underissuance cases for which the State agency received FNS regional office QC findings or regional Arbitrator findings on or after February 22, 1988 (the effective date of a final rule published on January 21, 1988 (53 FR 1603) which limited to 28 days the timeframe for State agencies requesting arbitration). This would apply to any subsampled case in which the State agency, FNS regional office QC unit, or regional Arbitrator had concluded that an underissuance had existed.

Two commenters endorsed the proposed 60 day arbitration period. The third commenter endorsed the 60 day arbitration period, but suggested that it apply to any underissuance cases retroactive to October 1, 1985 (the effective date for the change to the definition for "payment error rate" so that underissuances would be included in the definition). This suggestion was based primarily on another suggestion from this commenter that the definition of what constitutes an underissuance case be changed effective October 1, 1985. As noted in the section entitled Definitions—Section 271.2 the Department is not changing the definition of "underissuance". Therefore, the Department has decided not to adopt the suggestion that the arbitration period apply to all underissuances dating back to October 1, 1985. A paragraph has been included in this final rule at 7 CFR 272.1(g)(119) providing for a 60 day arbitration period for any underissuance cases for which Federal findings were received on, or after February 22, 1988.

Implementation

The provision of section 604 that amended section 16(c) of the Food Stamp Act, relating to the requirement to develop a CAP if a State agency does not qualify for enhanced funding, was effective and implemented on October 1, 1985. The corrective action provision of section 320 was effective and implemented on July 1, 1989. The provisions regarding State agency sampling plans are effective and must be implemented December 27, 1991. The provisions regarding the arbitration of underissuance cases are effective December 27, 1991, and must be implemented by January 27, 1992.

List of Subjects

7 CFR Part 271

Administrative practice and procedure, Food stamps, Grant programs-Social programs.

7 CFR Part 272

Alaska, Civil rights, Food stamps, Grant programs-social programs, Reporting and recordkeeping requirements.

7 CFR Part 275

Administrative practice and procedure, Food stamps, Reporting, and recordkeeping requirements.

7 CFR Part 277

Food stamps, Government procedure, Grant programs-Social programs, Investigations, Records, Reporting and recordkeeping requirements.

For the reasons set out in the preamble, parts 271, 272, 275 and 277 of subchapter C of chapter II of title 7 Code of Federal Regulations are amended as follows:

PART 271—GENERAL INFORMATION AND DEFINITIONS

1. The authority citation for part 271 continues to read as follows:

Authority: 7 U.S.C. 2011–2031.

2. In § 271.2, the definition of "payment error rate" and "underissuance error rate" are revised and two new definitions "overpayment error rate" and "underpayment error rate" are added in alphabetical order.

The revision and additions read as follows:

§ 271.2 Definitions.

* * * * *

Overpayment error rate means the percentage of the value of all allotments issued in a fiscal year that are either:

(1) Issued to households that fail to meet basic program eligibility requirements, or

(2) Overissued to eligible households.

Payment error rate means the sum of the point estimates of two component error rates: an overpayment error rate and an underpayment error rate. Each component error rate is the value of allotments either overissued or underissued expressed as a percentage of all allotments issued to completed active sample cases, excluding those cases processed by SSA personnel or participating in certain demonstration projects designated by FNS.

* * * * *

Underissuance error rate. (See *Underpayment error rate.*)

Underpayment error rate means the ratio of the value of allotments underissued to recipient households to the total value of allotments issued in a fiscal year by a State agency.

* * * * *

PART 272—REQUIREMENTS FOR PARTICIPATING STATE AGENCIES

3. The authority citation for part 272 continues to read as follows:

Authority: 7 U.S.C. 2011–2031.

4. In § 272.1, a new paragraph (g)(119) is added in numerical order to read as follows:

§ 272.1 General terms and conditions.

* * * * *

(g) *Implementation.* * * *

(119) *Amendment No. 328.* (i) The requirements for State agencies to begin implementation or corrective action for deficiencies which are the cause for non-entitlement to enhanced funding for the Fiscal Year 1986 review period, and review periods thereafter were effective as of October 1, 1985, pursuant to section 604 of Public Law 100–435.

(ii) The requirements for State agencies to begin the implementation of corrective action for deficiencies which result in underissuances, improper

denials or improper terminations of benefits to eligible households where such errors are caused by State agency rules, practices or procedures were effective July 1, 1989, pursuant to section 320 of Public Law 100–435. The corrective action must address all such deficiencies which occurred on or after July 1, 1989.

(iii) The State agency shall have until December 27, 1991, to implement changes in the development of quality control sampling plans, such that only those State agencies proposing non-proportional integrated, or other alternative sampling plan designs must:

(A) Demonstrate that the alternative design provides payment error rate estimates with equal-or-better predicted precision than would be obtained had the State agency reviewed simple random samples of the sizes specified in § 275.11(b)(1) of the regulations,

(B) Describe all weighting, and estimation procedures if the sample design is non-self-weighted, or uses a sampling technique other than systematic sampling,

(C) Demonstrate that self-weighting is actually achieved in sample designs claimed to be self-weighting.

(iv) The State agency shall have until January 27, 1992, to request regional arbitration of any federally subsampled underissuance cases for which the State agency received FNS regional office QC findings on or after February 22, 1988.

(v) The State agency shall have until January 27, 1992, to request national arbitration of any regional arbitration decisions involving underissuance cases for which the State agency received FNS regional arbitration findings on or after February 22, 1988.

PART 275—PERFORMANCE REPORTING SYSTEM

5. The authority citation for part 275 continues to read as follows:

Authority: 7 U.S.C. 2011–2031.

6. In § 275.1, paragraph (b) is revised to read as follows:

§ 275.1 General scope and purpose.

* * * * *

(b)(1) The Food Stamp Act authorizes the Secretary to pay each State agency an amount equal to 50 percent of all administrative costs involved in each State agency's operation of the program. The Act further authorizes the Secretary to increase the percentage share if:

(i) The State agency's payment error rate is less than or equal to 5.90 percent, and

(ii) The State agency's negative case error rate is less than the national weighted mean negative case error rate for the prior fiscal year.

(2) If a State agency qualifies for an increased percentage share, the amount of increase will be an additional percentage point for each full tenth of a percentage point by which the payment error rate is less than six percent, up to a maximum of 60 percent of administrative costs. Those State agencies not receiving the increased share of funding shall develop and implement corrective action plans to reduce payment errors. Corrective action shall be completed as required in subpart E of this section.

7. In § 275.3:

a. Paragraphs (c)(1)(i)(A) and (c)(3)(i)(A) are revised;

b. Paragraphs (c)(1)(i)(B) and (c)(3)(i)(B) are redesignated as paragraphs (c)(1)(i)(C) and (c)(3)(i)(C) respectively;

c. New paragraphs (c)(1)(i)(B) and (c)(3)(i)(B) are added.

The revisions and additions read as follows:

§ 275.3 Federal monitoring.

* * * * *

(c) *Validation of State Agency Error Rates.* * * *

(1) *Payment error rate.* * * *

(i) * * *

(A) In the above formula, n is the minimum number of Federal review sample cases which must be selected when conducting a validation review, except that FNS may select a lower number of sample cases if:

(*1*) The State agency does not report a change in sampling procedures associated with a revision in its required sample size within 10 days of effecting the change; and/or

(*2*) The State agency does not complete the number of case reviews specified in its approved sampling plan.

(B) The reduction in the number of Federal cases selected will be equal to the number of cases that would have been selected had the Federal sampling interval been applied to the State agency's shortfall in its required sample size. This number may not be exact due to random starts and rounding.

* * * * *

(3) *Negative case error rate.* * * *

(i) * * *

(A) In the above formula, n is the minimum number of Federal review sample cases which must be selected when conducting a validation review, except that FNS may select a lower number of sample cases if:

(*1*) The State agency does not report a change in sampling procedures associated with a revision in its required sample size within 10 days of effecting the change; and/or

(*2*) The State agency does not complete the number of case reviews specified in its approved sampling plan.

(B) The reduction in the number of Federal cases selected will be equal to the number of cases that would have been selected had the Federal sampling interval been applied to the State agency's shortfall in its required sample size. This number may not be exact due to random starts and rounding.

* * * * *

§ 275.10 [Amended]

8. In § 275.10, the last sentence of paragraph (a) is amended by removing the words "with combined payment error and underissuance error rates of 5 percent or more" and adding the words "that is not entitled to enhanced funding" in their place.

9. In § 275.11:

a. The introductory text of paragraph (a)(2) is amended by adding a new sentence between the heading and the first sentence;

b. Paragraphs (a)(2)(ii), (a)(2)(iii), (a)(2)(iv), and (a)(2)(v) are removed, and paragraphs (a)(2)(vi), (a)(2)(vii), and (a)(2)(viii) are redesignated as paragraphs (a)(2)(ii), (a)(2)(iii), and (a)(2)(iv) respectively;

c. The last sentence of paragraph (b)(4) is revised:

d. New paragraphs (b)(4)(i), (b)(4)(ii), and (b)(4)(iii) are added.

The revision and additions read as follows:

§ 275.11 Sampling.

(a) *Sampling plan.* * * *

(2) *Criteria.* Sampling plans proposing non-proportional integrated sampling, or other alternative designs shall document compliance with the approval criteria in paragraph (b)(4) of this section. * * *

* * * * *

(b) *Sample size.* * * *

(4) *Alternative designs.* * * * To receive FNS approval, proposals for any type of alternative design must:

(i) Demonstrate that the alternative design provides payment error rate estimates with equal-or-better predicted precision than would be obtained had the State agency reviewed simple random samples of the sizes specified in paragraphs (b)(1) and (b)(2) of this section.

(ii) Describe all weighting, and estimation procedures if the sample design is non-self-weighted, or uses a sampling technique other than systematic sampling.

(iii) Demonstrate that self-weighting is actually achieved in sample designs claimed to be self-weighting.

* * * * *

10. In § 275.16:

a. Paragraph (b)(2) is revised;

b. A new paragraph (b)(6) is added.

The revision and addition read as follows:

§ 275.16 Corrective action planning.

* * * * *

(b) * * *

(2) Are the cause for non-entitlement to enhanced funding for any reporting period (actions to correct errors in individual cases however, shall not be submitted as part of the State agency's corrective action plan);

* * * * *

(6) Result in underissuances, improper denials, or improper terminations of benefits to eligible households where such errors are caused by State agency rules, practices or procedures.

* * * * *

11. In § 275.23:

a. Paragraph (c)(2) is revised;

b. Paragraph (c)(3) is amended by adding the words "Prior to Fiscal Year 1986," at the beginning of the text of that paragraph;

c. Paragraph (d)(2) is revised;

d. The heading of paragraph (e)(2) is revised;

e. Paragraph (e)(2)(i) is revised;

f. The heading of paragraph (e)(3) is revised;

g. Paragraphs (e)(4), (e)(5), (e)(6) and (e)(7) are redesignated as (e)(5), (e)(6), (e)(7) and (e)(8), respectively and a new paragraph (e)(4) is added;

h. Newly redesignated paragraph (e)(7)(i) is revised;

i. Newly redesignated paragraph (e)(7)(iii) is revised;

j. A new paragraph (e)(9) is added.

The revisions and additions read as follows:

§ 275.23 Determination of State agency program performance.

* * * * *

(c) *State agency error rates.* * * *

(2) *Payment error rate.*

(i) For fiscal years prior to Fiscal Year 1986, the payment error rate shall include the value of the allotments overissued, including overissuances to ineligible cases, for those cases included in the active error rate.

(ii) For Fiscal Year 1986 and subsequent fiscal years, the payment error rate shall include the value of the allotments overissued, including those to ineligible cases, and the value of allotments underissued for those cases included in the active error rate.

* * * * *

(d) *Federal enhanced funding.* * * *

(2) After validation and any necessary adjustment of estimated error rates:

(i) A State agency with a combined payment error rate and underissuance error rate of less than five percent for an annual review period for Fiscal Year 1983 through Fiscal Year 1985, or a payment error rate of less than five percent for an annual review period for Fiscal Year 1986 through Fiscal Year 1988, shall be eligible for a 60 percent Federally funded share of administrative costs, provided that the State agency's negative case error rate for that period is less than the national weighted mean negative case error rate for the prior fiscal year;

(ii) Beginning with Fiscal Year 1989, a State agency with a payment error rate less than or equal to 5.90 percent and with a negative case error rate less than the national weighted mean negative case rate for the prior fiscal year will have its Federally funded share of administrative costs increased by one percentage point to a maximum of 60 percent for each full one-tenth of a percentage point by which the payment error rate is less than six percent.

* * * * *

(e) *State agencies' liabilities for payment error rates.*

* * * * *

(2) *Establishment of payment error rate goals—Fiscal Year 1983 through Fiscal Year 1985.*

(i) Each State agency's payment error rate goal for Fiscal Year 1983 shall be nine percent. Each State agency's payment error rate goal for Fiscal Year 1984 shall be seven percent. Each State agency's payment error rate goal for Fiscal Year 1985 shall be five percent. State agencies' payment error rates for any fiscal year shall be derived from the review period corresponding to the fiscal year.

* * * * *

(3) *State agencies failing to achieve payment error rate goals—Fiscal Year 1983 through Fiscal Year 1985.* * * *

(4) *State agencies' liabilities for payment error—Fiscal Year 1986 and Beyond.* Each State agency that fails to achieve its payment error rate goal during a fiscal year shall be liable as specified in the following paragraphs.

(i) For Fiscal Year 1986 and subsequent years, FNS shall announce a national performance measure within nine months following the end of each fiscal year that is the sum of the products of each State agency's payment error rate times that State agency's proportion of the total value of national allotments issued for the fiscal year using the most recent issuance data available at the time the State agency is initially notified of its payment error rate. Once announced, the national performance measure for a given fiscal year will not be subject to change. This national performance measure is used to establish a payment-error tolerance level. The payment-error tolerance level for any fiscal year shall be one percentage point added to the lowest national performance measure ever announced up to and including such fiscal year.

(ii) For any fiscal year in which a State agency's payment error rate exceeds the payment-error tolerance level, the State agency shall pay or have its share of administrative costs reduced by an amount equal to the difference between its payment error rate less such tolerance level as a quantity, multiplied by the total value of the allotments issued in the fiscal year by that State agency.

* * * * *

(7) *Determination of payment error rates.* * * *

(i) Once the Federal case reviews have been completed and all differences with the State agency have been identified, FNS shall calculate regressed error rates using the following linear regression equations.

(A) $y_1' = y_1 + b_1(X_1 - x_1)$, where y_1' is the average value of allotments overissued to eligible and ineligible households; y_1 is the average value of allotments overissued to eligible and ineligible households in the rereview sample according to the Federal finding. b_1 is the estimate of the regression coefficient regressing the Federal findings of allotments overissued to eligible and ineligible households on the corresponding State agency findings. x_1 is the average value of allotments overissued to eligible and ineligible households in the rereview sample according to State agency findings, and X_1 is the average value of allotments overissued to eligible and ineligible households in the full quality control sample according to State agency's findings. In stratified sample designs Y_1, X_1, and x_1 are weighted averages and b_1 is a combined regression coefficient in which stratum weights sum to 1.0 and are proportional to the estimated stratum caseloads subject to review.

(B) $y_2' = y_2 + b_2(X_2 - x_2)$, where y_2' is the average value of allotments underissued to households included in

the active error rate, y_2 is the average value of allotments underissued to participating households in the rereview sample according to the Federal finding, b_2 is the estimate of the regression coefficient regressing the Federal findings of allotments underissued to participating households on the corresponding State agency findings, x_2 is the average value of allotments underissued to participating households in the rereview sample according to State agency findings, and X_2 is the average value of allotments underissued to participating households in the full quality control sample according to the State agency's findings. In stratified sample designs y_2, X_2, and x_2 are weighted averages and b_1 is a combined regression coefficient in which stratum weights sum to 1.0 and are proportional to the estimated stratum caseloads subject to review.

(C) The regressed error rates are given by $r_1' = y_1'/u$, yielding the regressed overpayment error rate, and $r_2' = y_2'/u$, yielding the regressed underpayment error rate, where u is the average value of allotments issued to participating households in the State agency sample.

(D) After application of the adjustment provisions of paragraph (e)(7)(iii) of this section, the adjusted regressed payment error rate shall be calculated to yield the State agency's payment error rate for use in the reduced and enhanced funding determinations described in paragraphs (d) and (e) of this section. Prior to Fiscal Year 1986, the adjusted regressed payment error rate is given by r_1''. For Fiscal Year 1986 and after, the adjusted regressed payment error rate is given by $r_1'' + r_2''$.

* * * * *

(iii) Should a State agency fail to complete all of its required sample size, FNS shall adjust the State agency's regressed error rates using the following equations:

(A) $r_1'' = r_1' + 2(1-C)S_1$, where r_1'' is the adjusted regressed overpayment error rate, r_1' is the regressed overpayment error rate computed from the formula in paragraph (e)(7)(i)(C) of this section, C is the State agency's rate of completion of its required sample size expressed as a decimal value, and S_1 is the standard error of the State agency sample overpayment error rate. If a State agency completes all of its required sample size, then $r_1'' = r_1'$.

(B) $r_2'' = r_2' + 2(1-C)S_2$, where r_2'' is the adjusted regressed underpayment error rate, r_2' is the regressed underpayment error rate computed from the formula in paragraph (e)(7)(i)(C) of this section, C is the State agency's rate of completion of its required sample size expressed as a decimal value, and S_2 is the standard error of the State agency sample underpayment error rate. If a State agency completes all of its required sample size, then $r_2'' = r_2'$.

* * * * *

(9) *Interest charges.* (i) To the extent that a State agency does not pay a claim established under § 275.23(e)(4) within 30 days from the date on which the bill for collection (after a determination on any request for a waiver for good cause) is received by the State agency, the State agency shall be liable for interest on any unpaid portion of such claim accruing from the date on which the bill for collection was received by the State agency. This situation applies unless the State agency appeals the claim under § 276.7 of the regulations. If the State agency agrees to pay the claim through reduction in Federal financial participation for administrative costs, this agreement shall be considered to be paying the claim. If the State agency appeals such claim (in whole or in part), the interest on any unpaid portion of the claim shall accrue from the date of the decision on the administrative appeal, or from a date that is 2 years after the date the bill is received, whichever is earlier, until the date the unpaid portion of the payment is received.

(ii) If the State agency pays such claim (in whole or in part) and the claim is subsequently overturned through administrative or judicial appeal, any amounts paid by the State agency above what is actually due shall be promptly returned with interest, accruing from the date the payment was received until the date the payment is returned.

(iii) Any interest assessed under this paragraph shall be computed at a rate determined by the Secretary based on the average of the bond equivalent of the weekly 90-day Treasury bill auction rates during the period such interest accrues. The bond equivalent is the discount rate (i.e., the price the bond is actually sold for as opposed to its face value) determined by the weekly auction (i.e., the difference between the discount rate and face value) converted to an annualized figure. The Secretary shall use the investment rate (i.e., the rate for 365 days) compounded in simple interest for the period for which the claim is not paid. Interest billings shall be made quarterly with the initial billing accruing from the date the interest is first due. Because the discount rate for Treasury bills is issued weekly, the interest rate for State agency claims shall be averaged for the appropriate weeks.

PART 277—PAYMENTS OF CERTAIN ADMINISTRATIVE COSTS OF STATE AGENCIES

12. The authority citation for part 277 continues to read as follows:

Authority: 7 U.S.C. 2011–2031.

13. In § 277.4:

a. Paragraph (b)(2) is revised;

§ 277.4 [Amended]

b. Paragraph (b)(8), is amended by changing the regulatory reference to "§ 275.25" to read "§ 275.23".

The revision reads as follows:

§ 277.4 Funding.

* * * * *

(b) *Federal Reimbursement Rate.*

* * *

(2) A State agency's federally funded share of Food Stamp Program administrative costs shall be increased when its error rate, as determined through the quality control process described in part 275, meets certain standards.

(i) For the period beginning October 1, 1982, through September 30, 1988, a State agency with a payment error rate of five percent or less in the corresponding fiscal year shall have its federally funded share of Program administrative costs increased to 60 percent, provided that the State agency's negative case error rate is less than the national weighted mean negative case rate for the fiscal year prior to the period of enhanced funding.

(ii) For the period beginning October 1, 1988, and review periods thereafter, a State agency with a payment error rate less than or equal to 5.90 percent and with a negative case error rate less than the National weighted mean negative case error rate for the prior fiscal year shall have its Federally funded share of Food Stamp Program administrative costs increased by one percentage point to a maximum of 60 percent for each full one-tenth of a percentage point by which the payment error rate is less than six percent.

* * * * *

Dated: November 19, 1991.

Betty Jo Nelsen,

Administrator.

[FR Doc. 91-28288 Filed 11-26-91; 8:45 am]

BILLING CODE 3410-30-M

FEDERAL RESERVE SYSTEM

12 CFR Part 204

[Regulation D; Docket No. R-0741]

Reserve Requirements of Depository Institutions; Reserve Requirement Ratios

AGENCY: Board of Governors of the Federal Reserve System.

ACTION: Final rule.

SUMMARY: The Board is amending 12 CFR part 204 (Regulation D—Reserve Requirements of Depository Institutions) to increase the amount of transaction accounts subject to a reserve requirement ratio of three percent, as required by section 19(b)(2)(C) of the Federal Reserve Act (12 U.S.C. 461(b)(2)(C)), from $41.1 million to $42.2 million of net transaction accounts. This adjustment is known as the low reserve tranche adjustment. The Board has increased from $3.4 million to $3.6 million the amount of reservable liabilities of each depository institution that is subject to a reserve requirement of zero percent. This action is required by section 19(b)(11)(B) of the Federal Reserve Act (12 U.S.C. 461(b)(11)(B)), and the adjustment is known as the reservable liabilities exemption adjustment. The Board is also increasing from $44.0 million to $44.8 million the deposit cutoff level that is used in conjunction with the reservable liabilities exemption amount to determine the frequency of deposit reporting.

DATES: *Effective Date:* December 17, 1991.

Compliance Dates: For depository institutions that report weekly, the low reserve tranche adjustment and the reservable liabilities exemption adjustment will be effective on the reserve computation period that begins Tuesday, December 24, 1991, and on the corresponding reserve maintenance period that begins Thursday, December 26, 1991. For institutions that report quarterly, the low reserve tranche adjustment and the reservable liabilities exemption adjustment will be effective on the reserve computation period that begins Tuesday, December 17, 1991, and on the corresponding reserve maintenance period that begins Thursday, January 16, 1992. For all depository institutions, the increase in the deposit cutoff level will be used to screen institutions in the second quarter of 1992 to determine the reporting frequency for the twelve month period that begins in September 1992.

FOR FURTHER INFORMATION CONTACT: Patrick J. McDivitt, Attorney (202/452-3818), Legal Division, or June O'Brien, Economist (202/452-3790), Division of Monetary Affairs; for users of the Telecommunications Device for the Deaf (TDD), Dorothea Thompson (202/452-3544); Board of Governors of the Federal Reserve System, Washington, DC 20551.

SUPPLEMENTARY INFORMATION: Section 19(b)(2) of the Federal Reserve Act requires each depository institution to maintain reserves against its transaction accounts and nonpersonal time deposits, as prescribed by Board regulations. The initial reserve requirements imposed under section 19(b)(2) were set at three percent for total transaction accounts of $25 million or less and at 12 percent on total transaction accounts above $25 million for each depository institution. Section 19(b)(2) also provides that, before December 31 of each year, the Board shall issue a regulation adjusting for the next calendar year the total dollar amount of the transaction account tranche against which reserves must be maintained at a ratio of three percent. The adjustment in the tranche is to be 80 percent of the percentage change in total transaction accounts at all depository institutions over the one-year period that ends on the June 30 prior to the adjustment.

Currently, the low reserve tranche on transaction accounts is $41.1 million. The increase in the total of net transaction accounts of all depository institutions from June 30, 1990, to June 30, 1991 was 3.3 percent (from $592.7 billion to $612.1 billion). In accordance with section 19(b)(2), the Board is amending Regulation D to increase the low reserve tranche for transaction accounts for 1992 by $1.1 million to $42.2 million.

Section 19(b)(11)(A) of the Federal Reserve Act provides that $2 million of reservable liabilities [1] of each depository institution shall be subject to a zero percent reserve requirement. Section 19(b)(11)(A) permits each depository institution, in accordance with the rules and regulations of the Board, to designate the reservable liabilities to which this reserve requirement exemption is to apply. However, if transaction accounts are designated, only those that would otherwise be subject to a three percent reserve requirement (i.e., transaction accounts within the low reserve requirement tranche) may be so designated.

[1] Reservable liabilities include transaction accounts, nonpersonal time deposits, and Eurocurrency liabilities as defined in section 19(b)(5) of the Federal Reserve Act.

Section 19(b)(11)(B) of the Federal Reserve Act provides that, before December 31 of each year, the Board shall issue a regulation adjusting for the next calendar year the dollar amount of reservable liabilities exempt from reserve requirements. Unlike the adjustment for transaction accounts, which adjustment can result in a decrease as well as an increase, the change in the exemption amount is to be made only if the total reservable liabilities held at all depository institutions increases from one year to the next. The percentage increase in the exemption is to be 80 percent of the increase in total reservable liabilities of all depository institutions as of the year ending June 30. Total reservable liabilities of all depository institutions from June 30, 1990, to June 30, 1991, increased by 6.0 percent (from $1,223.0 billion to $1,296.3 billion). Under section 19(b)(11)(B), the reservable liabilities exemption amount will be increased by $0.2 million. Consequently, the reservable liabilities exemption amount for 1992 will increase to $3.6 million.

The effect of the application of section 19(b) of the Federal Reserve Act to the change in the total net transaction accounts and the change in the total reservable liabilities from June 30, 1990 to June 30, 1991 is to increase the low reserve tranche to $42.2 million, to apply a zero percent reserve requirement on the first $3.6 million of transaction accounts, and to apply a three percent reserve requirement on the remainder of the low reserve tranche.

The tranche adjustment and the reservable liabilities exemption adjustment for weekly reporting institutions will be effective on the reserve computation period beginning Tuesday, December 24, 1991, and on the corresponding reserve maintenance period beginning Thursday, December 26, 1991. For institutions that report quarterly, the tranche adjustment and the reservable liabilities exemption adjustment will be effective on the computation period beginning Tuesday, December 17, 1991, and on the reserve maintenance period beginning Thursday, January 16, 1992. In addition, all institutions currently submitting Form FR 2900 must continue to submit reports to the Federal Reserve under current reporting procedures.

In order to reduce the reporting burden for small institutions, the Board has established a deposit reporting cutoff level to determine deposit reporting frequency. Institutions are screened during the second quarter of each year to determine reporting frequency beginning the following

September. In March of 1985, the Board indexed this reporting cutoff level in an amount equal to 80 percent of the annual rate of increase of total deposits.[2] In July of 1988, in conjunction with approval of the extension of the deposit reporting system, the Board increased the cutoff level upon which the indexing is to be applied to $40 million. The current reporting cutoff level is $44.0 million.

From June 30, 1990, to June 30, 1991, total deposits grew 2.1 percent, from $3,712.3 billion to $3,791.9 billion. This results in an increase of $0.8 million in the deposit cutoff level that determines the frequency of reporting from the current $44.0 million to $44.8 million. Based on the indexation of the reserve requirement exemption, the cutoff level for total deposits above which reports of deposits must be filed will rise from $3.4 million to $3.6 million. Institutions with total deposits below $3.6 million are excused from reporting if their deposits can be estimated from other data sources. The $44.8 million cutoff level for weekly versus quarterly FR 2900 reporting and for quarterly FR 2910q versus annual FR 2910a reporting, and the $3.6 million level threshold for reporting will be used in the second quarter 1992 deposits report screening process, and the adjustments will be made when the new deposit reporting panels are implemented in September 1992.

All U.S. branches and agencies of foreign banks and all Edge and Agreement Corporations, regardless of size, are required to file weekly the Report of Transaction Accounts, Other Deposits and Vault Cash (FR 2900). All other institutions that have reservable liabilities in excess of the exemption level prescribed by section 19(b)(11) of the Federal Reserve Act (known as "nonexempt institutions") and total deposits at least equal to the deposit level ($44.8 million) are also required to file weekly the Report of Transaction Accounts, Other Deposits and Vault Cash (FR 2900). However, nonexempt institutions with total deposits less than the deposit cutoff level ($44.8 million), may file the FR 2900 quarterly for the twelve month period starting September 1992. Institutions that obtain funds from non-U.S. sources or that have foreign branches or international banking facilities are required to file the Report of Certain Eurocurrency Transactions (FR 2950/2951) on the same frequency as they file the FR 2900.

Institutions with reservable liabilities at or below the exemption level ($3.6 million) (known as "exempt institutions") must file the Quarterly Report of Selected Deposits, Vault Cash, and Reservable Liabilities (FR 2910q) if their total deposits are not below the deposit cutoff level ($44.8 million). Exempt institutions with total deposits less than the deposit cutoff level but more than the exemption amount must file the Annual Report of Total Deposits and Reservable Liabilities (FR 2910a). Institutions that have total deposits less than the exemption amount ($3.6 million) are not required to file deposit reports if their deposits can be estimated from other data sources.

Finally, the Board may require a depository institution to report on a weekly basis, regardless of the cutoff level, if the institution manipulates its total deposits and other reservable liabilities in order to qualify for quarterly reporting. Similarly, any depository institution that reports quarterly may be required to report weekly and to maintain appropriate reserve balances with its Reserve Bank if, during its computation period, it understates its usual reservable liabilities or it overstates the deductions allowed in computing required reserve balances.

Notice and Public Participation

The provisions of 5 U.S.C. 553(b) relating to notice and public participation have not been followed in connection with the adoption of these amendments because the amendments involve adjustments prescribed by statute and by an interpretative statement reaffirming the Board's policy concerning reporting practices. The amendments also reduce regulatory burdens on depository institutions. Accordingly, the Board finds good cause for determining, and so determines, that notice and public participation are unnecessary and contrary to the public interest.

The provisions of 5 U.S.C. 553(d) relating to notice of the effective date of a rule have not been followed in connection with the adoption of these amendments because the amendments relieve a restriction on depository institutions, and for this reason there is good cause to determine, and the Board so determines, that such notice is not necessary.

Regulatory Flexibility Act Analysis

Pursuant to section 605(b) of the Regulatory Flexibility Act (Pub. L. No. 96-354, 5 U.S.C. 601 *et seq.*), the Board certifies that the proposed amendments will not have a significant economic impact on a substantial number of small entities. The proposed amendments reduce certain regulatory burdens for all depository institutions, reduce certain burdens for small depository institutions, and have no particular effect on other small entities.

List of Subjects in 12 CFR Part 204

Banks, banking, Currency, Federal Reserve System, Mortgages, Penalties Reporting and record keeping requirements.

Pursuant to the Board's authority under section 19 of the Federal Reserve Act, 12 U.S.C. 461 *et seq.*, the Board is amending 12 CFR Part 204 as follows:

PART 204—RESERVE REQUIREMENTS OF DEPOSITORY INSTITUTIONS

1. The authority citation for part 204 continues to read as follows:

Authority: Sections 11(a), 11(c), 19, 25, 25(a) of the Federal Reserve Act (12 U.S.C. 248(a), 248(c), 371a, 371b, 461, 601, 611); section 7 of the International Banking Act of 1978 (12 U.S.C. 3105); and section 411 of the Garn St-Germain Depository Institutions Act of 1982 (12 U.S.C. 461).

2. In § 204.9 paragraphs (a)(1) and (a)(2) are revised to read as follows:

§ 204.9 Reserve requirement ratios.

(a)(1) Reserve percentages. The following reserve ratios are prescribed for all depository institutions, Edge and Agreement Corporations, and United States branches and agencies of foreign banks:

Category	Reserve requirement
Net transaction accounts:[1]	
$0 to $42.2 million	3 percent of amount.
Over $42.2 million	$1,266,000 plus 12 percent of amount over $42.2 million.
Nonpersonal time deposits.	0 percent.
Eurocurrency liabilities	0 percent.

[1] Dollar amounts do not reflect the adjustment to be made by the next paragraph.

(2) Exemption from reserve requirements. Each depository institution, Edge or agreement corporation, and U.S. branch or agency of a foreign bank is subject to a zero percent reserve requirement on an amount of its transaction accounts subject to the low reserve tranche in paragraph (a)(1) of this section not in excess of $3.6 million determined in accordance with § 204.3(a)(3) of this part.

* * * * *

[2] In November of 1985, the Board amended the definition of "total deposits" as used in determining the cutoff level to include not only gross transaction deposits, savings accounts, and time deposits, but also reservable obligations of affiliates, ineligible acceptance liabilities, and net Eurocurrency liabilities.

By order of the Board of Governors of the Federal Reserve System, November 21, 1991.

William W. Wiles,

Secretary of the Board.

BILLING CODE 6210-01-M

12 CFR Part 263

[Docket No. R-0733]

RIN 7100-AB23

Uniform Rules of Practice and Procedure; Corrections

AGENCY: Board of Governors of the Federal Reserve System.

ACTION: Final rule; correction.

SUMMARY: This notice corrects a previous **Federal Register** notice (FR Doc. 91-18913) that implemented a final rule revising rules of practice and procedure for administrative hearings.

FOR FURTHER INFORMATION CONTACT: Douglas B. Jordan, Senior Attorney, Legal Division, (202/452-3787).

EFFECTIVE DATE: August 9, 1991.

SUPPLEMENTARY INFORMATION: This notice corrects a previous **Federal Register** notice (FR Doc. 91-18913) published at page 38048, column 1, of the issue for Friday, August 9, 1991.

1. On page 38052, column 1, the amendment to § 262.3 contains a cross reference to the Board's Rules of Practice for Hearings "[part 262 of this chapter]" which should be corrected to read "[part 263 of this chapter]".

2. On page 38056, column 2, § 263.16, the word "Agency" should be removed and the words "Board or any Federal Reserve Bank" added in its place.

Board of Governors of the Federal Reserve System, November 21, 1991.

William W. Wiles,

Secretary of the Board.

BILLING CODE 6210-01-F

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

14 CFR Part 39

[Docket No. 91-CE-83-AD; Amendment 39-8109; AD 91-25-08]

Airworthiness Directives; Cessna Models 421C and 425 Airplanes

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Final rule; request for comments.

SUMMARY: This amendment adopts a new airworthiness directive (AD) that is applicable to certain Cessna Models 421C and 425 airplanes. This AD action requires initial and repetitive inspections of both wing front spar upper caps for cracks, and repair of a spar if cracks are found that exceed certain criteria. Cracks have been found in the wing front spar upper cap at the main landing gear actuating cylinder attachment fitting on three of the affected airplanes. The actions specified by this AD are intended to prevent wing failure because of excessive wing spar cracking.

DATES: *Effective* December 23, 1991.

The incorporation by reference of certain publications listed in the regulations is approved by the Director of the **Federal Register** as of December 23, 1991.

Comments for inclusion in the Rules Docket must be received on or before January 31, 1992.

ADDRESSES: Cessna Service Bulletin (SB) MEB91-7 and SB CQB91-8, both dated October 18, 1991, may be obtained from the Cessna Aircraft Company, Customer Service Department 753, P.O. Box 7704, Wichita, Kansas 67277; Telephone (316) 941-7550; Facsimile (316) 942-9008. This information may also be examined at the Rules Docket at the address below.

Send comments on this AD in triplicate to the FAA, Central Region, Office of the Assistant Chief Counsel, Attention: Rules Docket 91-CE-83-AD, Room 1558, 601 E. 12th Street, Kansas City, Missouri 64106.

FOR FURTHER INFORMATION CONTACT: Mr. Larry Abbott, Aerospace Engineer, Wichita Aircraft Certification Office, 1801 Airport Road, room 100, Mid-Continent Airport, Wichita, Kansas 67209; Telephone (316) 946-4123; Facsimile (316) 426-4407.

SUPPLEMENTARY INFORMATION: Cracks have been found in the wing front spar upper cap on three Cessna Models 421C and 425 airplanes. These cracks were located at the main landing gear actuating cylinder attachment fitting outboard of the front spar wing attach fittings.

The Cessna Aircraft Company has issued Cessna Service Bulletin (SB) MEB91-7 and Cessna SB CQB91-8, both dated October 18, 1991, which specify procedures for inspecting both wing front spar upper caps for cracks on Cessna Models 421C and 425 airplanes. The FAA examined the above situation, reviewed all available information, and has determined that, in order to prevent wing failure caused by cracked front spar upper caps, airworthiness directive (AD) action should be taken.

Since the condition described is likely to exist or develop in other Cessna Models 421C and 425 airplanes of the same type design, this AD requires initial and repetitive inspections of both wing front spar upper caps at the main landing gear actuating cylinder attachment fittings in accordance with the instructions in Cessna SB MEB91-7 or Cessna SB CQB91-8, whichever is applicable. It requires repair of a wing front spar upper cap if cracks are found that exceed certain criteria. This action also requires an inspection reporting program. Based on the information received from this program, additional rulemaking may be initiated.

Because an emergency condition exists that requires the immediate adoption of this regulation, it is found that notice and public procedure hereon are impracticable and that good cause exists for making this amendment effective in less than 30 days. Although this action is in the form of a final rule that involves requirements affecting immediate flight safety and, thus, was not preceded by notice and public procedure, comments are invited on this rule. Interested persons are invited to comment on this rule by submitting such written data, views, or arguments as they may desire. Communications should identify the regulatory docket number and be submitted in triplicate to the address specified above. All communications received on or before the closing date for comments will be considered and this rule may be amended in light of the comments received. Factual information that supports the commenter's ideas and suggestions is extremely helpful in evaluating the effectiveness of the AD action and determining whether additional rulemaking action would be needed.

Comments are specifically invited on the overall regulatory, economic, environmental, and energy aspects of the rule that might suggest a need to modify the rule. All comments submitted will be available, both before and after the closing data for comments, in the Rules Docket at the address given above. A report that summarizes each FAA-public contact concerned with the substance of this AD will be filed in the Rules Docket.

The regulations adopted herein will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. Therefore, in accordance with Executive Order 12612, it is determined that this final rule does not

have sufficient federalism implications to warrant the preparation of a Federalism Assessment.

The FAA has determined that this regulation in an emergency regulation and that it is not considered to be major under Executive Order 12291. It is impracticable for the agency to follow the procedures of Executive Order 12291 with respect to this rule since the rule must be issued immediately to correct an unsafe condition in aircraft. It has been determined further that this action involves an emergency regulation under DOT Regulatory Policies and Procedures (44 FR 11034, February 26, 1979). If it is determined that this emergency regulation otherwise would be significant under DOT Regulatory Policies and Procedures, a final regulatory evaluation will be prepared and placed in the Rules Docket (otherwise, an evaluation is not required). A copy of it, if filed, may be obtained from the Rules Docket.

List of Subjects in 14 CFR Part 39

Air transportation, Aircraft, Aviation safety, Incorporation by reference, Safety

Adoption of the Amendment

Accordingly, pursuant to the authority delegated to me by the Administrator, the Federal Aviation Administration amends 14 CFR part 39 of the Federal Aviation Regulations as follows:

PART 39—[AMENDED]

1. The authority citation for part 39 continues to read as follows:

Authority: 49 U.S.C. 1354(a), 1421 and 1423; 49 U.S.C. 106(g); and 14 CFR 11.89

§ 39.13 [Amended]

2. Section 39.13 is amended by adding the following new AD:

91-25-08 Cessna: Amendment 39-8109; Docket No. 91-CE-83-AD. Applicability: Model 421C airplanes (serial numbers (S/N) 421C0801 through 421C1807) and Model 425 airplanes (S/N 425-0002 through 425-0236), certificated in any category.

Compliance: Required as indicated, unless already accomplished.

Note: The compliance time in this AD takes precedence over that cited in the referenced service information.

To prevent wing failure caused by cracks in a wing front spar upper cap, which could result in loss of control of the airplane, accomplish the following:

(a) Upon the accumulation of 3,000 hours time-in-service (TIS) or within the next 25 hours TIS after the effective date of this AD, whichever occurs later, fluorescent penetrant inspect both wing front spar upper caps for cracks between the main landing gear actuating cylinder attachment and the front spar wing attach fittings in accordance with the instructions in Cessna Service Bulletin (SB) MEB91-7 or Cessna SB CQB91-8, both dated October 18, 1991, whichever is applicable.

(1) If any crack is found that is 2.5 inches or greater in length that is parallel to the top of the spar cap or any crack that is perpendicular to the top of the spar cap, prior to further flight, obtain a repair scheme from the manufacturer through the Wichita Aircraft Certification Office at the address specified in paragraph (b) of this AD, and reinspect thereafter at intervals not to exceed 300 hours TIS.

(2) If any crack is found that is less than 2.5 inches in length and is parallel to the top of the spar cap, return the airplane to service and reinspect thereafter at intervals not to exceed 25 hours TIS.

(3) If no cracks are found, return the airplane to service and reinspect thereafter at intervals not to exceed 300 hours TIS.

(b) Send the results of each inspection in writing to the Manager, Wichita Aircraft Certification Office, FAA, 1801 Airport Road, Room 100, Wichita, Kansas 67209, within 10 days after each inspection. State whether cracks were found, the location and length of any cracks, and the total hours TIS of the component at the time the crack was discovered. Reports may be submitted by filling out the form provided in the applicable service bulletin. (Reporting approved by the Office of Management and Budget under OMB No. 2120-0056.)

(c) Special flight permits may be issued in accordance with FAR 21.197 and 21.199 to operate the airplane to a location where the requirements of this AD can be accomplished.

(d) An alternative method of compliance or adjustment of the initial or repetitive compliance times that provides an equivalent level of safety may be approved by the Manager, Wichita Aircraft Certification Office at the address specified in paragraph (b) of this AD. The request should be forwarded through an appropriate FAA Maintenance Inspector, who may add comments and then send it to the Manager, Wichita Aircraft Certification Office.

(e) The inspections required by this AD shall be done in accordance with Cessna Service Bulletin MEB91-7 or Cessna Service Bulletin CQB91-8, both dated October 18, 1991, whichever is applicable. This incorporation by reference was approved by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR Part 51. Copies may be obtained from the Cessna Aircraft Company, Customer Service Department 753, P.O. Box 7704, Wichita, Kansas 67277. Copies may be inspected at the FAA, Central Region, Office of the Assistant Chief Counsel, Room 1558, 601 E. 12th Street, Kansas City, Missouri, or at the Office of the Federal Register, 1100 L Street, NW; room 8401, Washington, DC. This amendment becomes effective on December 23, 1991.

Issued in Kansas City, Missouri, on November 29, 1991.

John E. Tigue,

Acting Manager, Small Airplane Directorate, Aircraft Certification Service.

[FR Doc. 91-28413 Filed 11-26-91; 8:45 am]

BILLING CODE 4910-13-M

14 CFR Part 39

[Docket No. 91-NM-221-AD; Amendment 39-8094; AD 91-24-08]

Airworthiness Directives; McDonnell Douglas Model MD-11 Series Airplanes

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Final rule.

SUMMARY: This amendment adopts a new airworthiness directive (AD), applicable to McDonnell Douglas Model MD-11 series airplanes, which requires a borescope inspection of the left and right outboard flap inboard and outboard closure rib spindle support fittings, and a visual inspection for cracks and delamination of the flap upper skin, and repair, if necessary. This amendment is prompted by reports of cracks in the outboard flap assembly inboard and outboard closure rib spindle support fittings and flap upper skin. This condition, if not corrected, could result in fatigue cracking and possible structural failure of the outboard flaps.

DATES: Effective December 12, 1991.

The incorporation by reference of certain publications listed in the regulations is approved by the Director of the Federal Register as of December 12, 1991.

ADDRESSES: The applicable service information may be obtained from McDonnell Douglas Corporation, Technical Publications-Technical Administrative Support, C1-L5B, 3855 Lakewood Boulevard, Long Beach, California 90846. This information may be examined at the FAA, Northwest Mountain Region, Transport Airplane Directorate, 1601 Lind Avenue SW., Renton, Washington; or at the Los Angeles Aircraft Certification Office, 3229 East Spring Street, Long Beach, California; or at the Office of the Federal Register, 1100 L Street NW., room 8401, Washington, DC.

FOR FURTHER INFORMATION CONTACT: Ms. Maureen Moreland, Aerospace Engineer, ANM-121L, FAA, Northwest Mountain Region, Transport Airplane Directorate, Los Angeles, California; telephone (213) 988-5238.

SUPPLEMENTARY INFORMATION:

McDonnell Douglas has reported to the FAA findings of fatigue cracks in the outboard flap assembly on inboard and outboard closure rib spindle support fittings that were removed from three Model MD–11 flight test airplanes. Cracks were found in four outboard flap inboard and outboard spindle support fittings on two airplanes and in three fittings on the third airplane. The cracks were located in the upper and lower horizontal flanges of the fittings. In addition, cracks and delamination of the flap upper skin at the intersection/transition radius area of the outboard closure ribs were found on three flight test and four in-service airplanes. This condition, if not corrected, could result in fatigue cracking and possible structural failure of the outboard flaps.

The FAA has reviewed and approved McDonnell Douglas Alert Service Bulletin A57–15, Revision 2, dated October 28, 1991, which describes procedures for visual and borescope inspections for cracks, and necessary repair, of the outboard flap closure rib support fittings and upper and lower skin. The service bulletin also describes a modification of the closure rib spindle fittings and the addition of a doubler to the upper and lower flap skins.

Since this situation is likely to exist or develop on other airplanes of the same type design, this AD requires repetitive inspection of the left and right outboard flap inboard and outboard closure rib spindle support fittings and flap upper skin, and modification or repair, if necessary, in accordance with the service bulletin previously described.

Since a situation exists that requires immediate adoption of this regulation, it is found that notice and public procedure hereon are impracticable, and good cause exists for making this amendment effective in less than 30 days.

This is considered to be interim action. The FAA is considering further rulemaking to require the installation of a modification that will terminate the requirement for the repetitive inspections. However, the proposed compliance time is sufficiently long so that notice and public comment will not be impracticable.

The regulations adopted hereon will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. Therefore, in accordance with Executive Order 12612, it is determined that this final rule does not have sufficient federalism implications to warrant the preparation of a Federalism Assessment.

The FAA has determined that this regulation is an emergency regulation and that it is not considered to be major under Executive Order 12291. It is impracticable for the agency to follow the procedures of Order 12291 with respect to this rule since the rule must be issued immediately to correct an unsafe condition in aircraft. It has been determined further that this action involves an emergency regulation under DOT Regulatory Policies and Procedures (44 FR 11034, February 26, 1979). If it is determined that this emergency regulation otherwise would be significant under DOT Regulatory Policies and Procedures, a final regulatory evaluation will be prepared and placed in the Rules Docket. A copy of it, if filed, may be obtained from the Rules Docket.

Air transportation, Aircraft, Aviation safety, Incorporation by reference, Safety.

Adoption of the Amendment

Accordingly, pursuant to the authority delegated to me by the Administrator, the Federal Aviation Administration amends 14 CFR part 39 of the Federal Aviation Regulations as follows:

PART 39—[AMENDED]

1. The authority citation for Part 39 continues to read as follows:

Authority: 49 U.S.C. 1354(a), 1421 and 1423; 49 U.S.C. 106(g); and 14 CFR 11.89.

§ 39.13 [Amended]

2. Section 39.13 is amended by adding the following new airworthiness directive:

91–24–08. McDonnell Douglas: Amendment 39–8094. Docket No. 91–NM–221–AD.

Applicability: Model MD–11 series airplanes, certificated in any category.

Compliance: Required as indicated, unless previously accomplished.

To prevent fatigue cracking and possible structural failure of the outboard flaps, accomplish the following:

(a) Prior to the accumulation of 400 landings, or within 30 days after the effective date of this AD, whichever occurs later, perform a borescope inspection to detect cracks in the left and right outboard flap inboard and outboard closure rib spindle support fittings, in accordance with Paragraph 2, "Accomplishment Instructions," of McDonnell Douglas Alert Service Bulletin A57–15, Revision 2, dated October 28, 1991 (hereinafter referred to as the Service Bulletin).

(b) Within 30 days after the effective date of this AD, perform a visual inspection for cracks and delamination of the upper skin of the outboard flaps in accordance with the Service Bulletin.

(c) If no cracking or delamination is found as a result of the inspections required by paragraphs (a) and (b) of this AD, accomplish either subparagraph (c)(1) or (c)(2) of this AD:

(1) Repeat the borescope inspections of the spindle support fittings required by paragraph (a) of this AD at intervals not to exceed 400 landings; and repeat the visual inspections of the upper skin required by paragraph (b) of this AD at intervals not to exceed 60 days. In cases where no cracking is found, the accomplishment of the modification shown in Figures 3 and 4 and described in Tables I and II of the Service Bulletin constitutes terminating action for the repetitive inspections required by this paragraph. Or

(2) Prior to further flight, accomplish the modification shown in Figures 3 and 4 and described in Tables I and II of the Service Bulletin.

(d) If a crack with a length of less than 1 inch is found in the spindle support fitting as a result of the borescope inspections required by paragraphs (a) or (c)(1) of this AD, accomplish either subparagraph (d)(1) or (d)(2) of this AD:

(1) Prior to further flight, accomplish the modification shown in Figures 3 and 4 and described in Tables I and II of the Service Bulletin. In cases where such cracking is found, this modification is considered to be an interim (temporary) action only. Or

Note: The FAA is considering further rulemaking to require the accomplishment of a permanent repair.

(2) Prior to further flight, incorporate a permanent repair in a manner approved by the Manager, Los Angeles Aircraft Certification Office (ACO), FAA, Transport Airplane Directorate. The accomplishment of this permanent repair constitutes terminating action for the repetitive inspections required by paragraph (c)(1) of this AD.

(e) If a crack with a length of greater than 1 inch is found in the spindle support fitting as a result of the borescope inspections required by paragraph (a) or (c)(1) of this AD, prior to further flight, accomplish a permanent repair in a manner approved by the Manager, Los Angeles Aircraft Certification Office (ACO), FAA, Transport Airplane Directorate. Accomplishment of this permanent repair constitutes terminating action for the repetitive inspections required by paragraph (c)(1) of this AD.

(f) If cracks or delamination are found in the skin as a result of the inspections required by paragraph (b) of this AD, prior to further flight, accomplish the modification shown in Figures 3 and 4 and described in Tables I and II of the Service Bulletin. Accomplishment of this modification constitutes terminating action for the repetitive inspections required by paragraph (c)(1) of this AD.

(g) An alternative method of compliance or adjustment of the compliance time, which provides an acceptable level of safety, may be used when approved by the Manager, Los Angeles Aircraft Certification Office (ACO), FAA, Transport Airplane Directorate.

Note: The request should be forwarded through an FAA Principal Maintenance Inspector (PMI), who may concur or comment and then send it to the Manager, Los Angeles ACO.

(h) Special flight permits may be issued in accordance with FAR 21.197 and 21.199 to operate airplanes to a base in order to comply with the inspection requirements of this AD.

(i) The inspection and modification requirements shall be done in accordance with McDonnell Douglas MD–11 Alert Service Bulletin A57–15, Revision 2, dated October 28, 1991. This incorporation by reference was approved by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR Part 51. Copies may be obtained from McDonnell Douglas Corporation, Technical Publications-Technical Administrative Support, C1–L5B, 3855 Lakewood Boulevard, Long Beach, California 90846. Copies may be inspected at the FAA, Northwest Mountain Region, Transport Airplane Directorate, 1601 Lind Avenue SW., Renton, Washington; or at the Los Angeles Aircraft Certification Office, 3229 East Spring Street, Long Beach, California; or at the Office of the Federal Register, 1100 L Street NW., room 8401, Washington, DC.

This amendment (39–8094, AD 91–24–08) becomes effective on December 12, 1991.

Issued in Renton, Washington, on November 4, 1991.

Darrell M. Pederson,

Acting Manager, Transport Airplane Directorate, Aircraft Certification Service.

BILLING CODE 4910–13–M

DEPARTMENT OF COMMERCE

Technology Administration

15 CFR Part 1170

Productvity, Technology, and Innovation Metric Conversion Policy for Federal Agencies; Correction of Final Rule

AGENCY: Technology Administration, Commerce.

ACTION: Final rule; correction.

SUMMARY: The Department of Commerce's Technology Administration (hereinafter "TA") is correcting the table of contents pertaining to its regulations on Metric Conversion Policy for Federal Agencies, found at 15 CFR part 1170. TA published a Notice of Final Rule and Redesignation on Tuesday, August 20, 1991, which, *inter alia*, redesignated the section numbers for its regulations on Metric Conversion Policy for Federal Agencies from 15 CFR part 19 (subpart B) to 15 CFR part 1170. This is to correct the table of contents that was incorrectly listed in the Notice of Final Rule and Redesignation, published in the **Federal Register** on Tuesday, August 20, 1991 at page 41283.

EFFECTIVE DATE: November 27, 1991.

FOR FURTHER INFORMATION CONTACT: Philip J. Greene (202) 377–5394.

SUPPLEMENTARY INFORMATION: TA has promulgated regulations on Metric Conversion Policy for Federal Agencies to provide policy and guidelines for coordination for Federal agencies to deal with increasing use of the metric system within the Federal Government, consistent with voluntary conversion in State and local governments and in the private sector. These regulations were formerly found at 15 CFR part 19 (subpart B). On Tuesday, August 20, 1991, TA published a Notice of Final Rule and Redesignation which, *inter alia*, moved the above referenced regulations from 15 CFR part 19 (subpart B) to 15 CFR part 1170. In doing so, it published an incorrect table of contents. This is to correct the table of contents that was incorrectly listed in the above referenced Notice of Final Rule and Redesignation.

Dated: November 15, 1991.

Deborah Wince-Smith,

Assistant Secretary of Commerce for Technology Policy.

In the **Federal Register** issue of Tuesday, August 20, 1991, on page 41283, column one, the table of contents for 15 CFR part 1170 is correctly revised to read as follows:

Sec.
1170.1 Purpose.
1170.2 Definition.
1170.3 General policy.
1170.4 Guidelines.
1170.5 Recommendations for agency organization.
1170.6 Reporting requirement.
1170.7—1170.199 [Reserved].

BILLING CODE 3510–13–M

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Social Security Administration

20 CFR Part 404

[Regulations No. 4]

RIN 0960–None Assigned

Federal Old-Age, Survivors and Disability Insurance; Determining Disability and Blindness; Extension of Expiration Date for Respiratory System Listings

AGENCY: Social Security Administration, HHS.

ACTION: Final rule.

SUMMARY: We are extending the expiration date of the respiratory system listings found in appendix I of part 404, subpart P, from December 6, 1991, to December 7, 1992. We have made no revisions in the medical criteria in the respiratory system listings; they remain the same as they now appear in the Code of Federal Regulations. We are presently considering revisions to update the medical criteria contained in part A and part B of the listings, and any revised criteria will be published as a proposed rule when we have completed our review.

EFFECTIVE DATE: This final rule will be effective November 27, 1991.

FOR FURTHER INFORMATION CONTACT: William J. Ziegler, Legal Assistant, Office of Regulations, Social Security Administration, 6401 Security Boulevard, Baltimore, MD 21235, (301) 965–1759.

SUPPLEMENTARY INFORMATION: On December 6, 1985, a revised Listing of Impairments in appendix 1 to subpart P of part 404 was published in the **Federal Register** (50 FR 50068). The Listing of Impairments describes, for each of 13 major body systems, impairments that are considered severe enough to preclude a person from engaging in any gainful activity (part A), or in the case of a child under the age of 18, impairments that are severe enough to prevent the child from functioning independently, appropriately, and effectively in an age-appropriate manner (part B). The Listing of Impairments is used for evaluating disability and blindness under the social security disability program and the supplemental security income program.

When the revised Listing of Impairments was published in 1985, we indicated that disability evaluation and treatment and program experience would require that the listings be periodically reviewed and updated. Accordingly, expiration dates were established ranging from 4 to 8 years for each of the specific body systems. A termination date of December 6, 1991, was established for part A of the respiratory system listings at that time. Part B of the listings has a termination date of December 6, 1993.

In May 1986, the Social Security Administration (SSA) asked several experts to review the current respiratory listings and propose revisions to SSA based upon advances in medical knowledge and technology. These experts included representatives from national medical professional groups and Federal and State representatives

with expertise in the evaluation of disability claims involving respiratory impairments. Three additional meetings were held over the next year, and the experts submitted their individual recommendations to SSA on May 20, 1988. These recommendations have required careful study as we have reviewed the existing listings and considered the development of new regulations.

As a result of our continuing and careful review of the listings, we now find that we will not have sufficient time to publish a notice of proposed rulemaking (with a 60-day period for public comment), setting out proposed revisions to the current listings and then publish a final regulation in the **Federal Register** by December 6, 1991. We have, therefore, decided to extend the current respiratory system listings without change for a period of 12 months and one day—from the present expiration date of December 6, 1991 to December 7, 1992. We would be extending the expiration date for one year, but December 6, 1992 is a Sunday. Under 20 CFR 404.3(c), the regulation would remain in effect through December 7, 1992. Therefore, we are extending the time period for an additional day. We believe this extension will give us sufficient time to publish any revised listings as a proposed rule (with a 60-day period for public comment), and then publish a final regulation in the **Federal Register** by December 7, 1992.

Regulatory Procedures

The Department, even when not required by statute, as a matter of policy, generally follows the Administrative Procedure Act notice of proposed rulemaking and public comment procedures specified in 5 U.S.C. 553 in the development of its regulations. The Administrative Procedure Act provides exceptions to its notice and public comment procedures when an agency finds there is good cause for dispensing with such procedures on the basis that they are impracticable, unnecessary, or contrary to the public interest. We have determined that, under 5 U.S.C. 553(b)(B), good cause exists for waiver of notice of proposed rulemaking and public comment procedures on this rule because it only extends the expiration date of part A of the respiratory system listings and makes no substantive changes to these listings. The current regulations expressly provide that the listings may be extended by the Secretary, as well as revised and promulgated again. Because we are not making any revisions to the current listings, use of public comment procedures is not contemplated by the existing regulations and is unnecessary under the Administrative Procedure Act. After our review of the existing respiratory system listings is completed, proposed revisions to the existing criteria will be published for public comment.

Executive Order 12291

The Secretary has determined that this is not a major rule under Executive Order 12291 because this regulation does not meet any of the threshold criteria for a major rule. Therefore, a regulatory impact analysis is not required.

Regulatory Flexibility Act

We certify that this regulation will not have a significant economic impact on a substantial number of small entities because it only affects disability claimants under titles II and XVI of the Act.

Paperwork Reduction Act

This regulation imposes no reporting or recordkeeping requirements necessitating clearance by the Office of Management and Budget.

(Catalog of Federal Domestic Assistance Program No. 93.802, Social Security Disability Insurance; No. 93.807, Supplemental Security Income Program)

List of Subjects in 20 CFR Part 404

Administrative practice and procedure, Blind, Disability benefits, Old-age, Survivors and Disability Insurance, Reporting and recordkeeping requirements, Social Security.

Dated: October 22, 1991.

Gwendolyn S. King,

Commissioner of Social Security.

Approved: November 12, 1991.

Louis W. Sullivan,

Secretary of Health and Human Services.

For the reasons set forth in the preamble, part 404, title 20 of the Code of Federal Regulations is amended as set forth below.

PART 404—FEDERAL OLD-AGE, SURVIVORS AND DISABILITY INSURANCE (1950–)

1. The authority citation for subpart P of part 404 is revised to read as follows:

Authority: Secs. 202, 205 (a), (b), and (d)–(h), 216(i), 221 (a) and (i), 222(c), 223, 225, and 1102 of the Social Security Act; 42 U.S.C. 402, 405 (a), (b) and (d)–(h), 416 (i), 421 (a) and (j), 422 (c), 423, 425, and 1302.

2. Appendix 1 to subpart P, is amended by revising the third paragraph of the introductory text to read as follows:

Appendix 1 to Subpart P—Listing of Impairments

The respiratory system (3.00) will no longer be effective on December 7, 1992.

BILLING CODE 4190-29-M

DEPARTMENT OF THE INTERIOR

Office of Surface Mining Reclamation and Enforcement

30 CFR Part 914

Indiana Permanent Regulatory Program; Self-Bonding

AGENCY: Office of Surface Mining Reclamation and Enforcement (OSM), Interior.

ACTION: Final rule; approval of amendment.

SUMMARY: OSM is announcing the approval of a proposed amendment to the Indiana permanent regulatory program (hereinafter referred to as the Indiana program) under the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The amendment (Program Amendment Number 91-7A) consists of proposed changes to the Indiana Surface Mining Statute provisions concerning self-bonding. The amendment is intended to adopt certain provisions of the 1990 Indiana Senate Enrolled Act 52.

EFFECTIVE DATE: November 27, 1991.

FOR FURTHER INFORMATION CONTACT: Mr. Richard D. Rieke, Director, Indianapolis Field Office, Office of Surface Mining Reclamation and Enforcement, Minton-Capehart Federal Building, 575 North Pennsylvania Street, room 301, Indianapolis, IN 46204, telephone (317) 226-6166.

SUPPLEMENTARY INFORMATION:

I. Background on the Indiana Program
II. Submission of the Amendment
III. Director's Findings
IV. Summary and Disposition of Comments
V. Director's Decision
VI. Procedural Determinations

I. Background on the Indiana Program

On July 29, 1982, the Indiana program was made effective by the conditional approval of the Secretary of the Interior. Information pertinent to the general background on the Indiana program, including the Secretary's findings, the disposition of comments, and a detailed explanation of the conditions of approval of the Indiana program can be found in the July 26, 1982 **Federal**

Register (47 FR 32107). Subsequent actions concerning the conditions of approval and program amendments are identified at 30 CFR 914.15 and 914.16.

II. Submission of the Amendment

By letter dated June 4, 1991 (Administrative Record No. IND–0894), the Indiana Department of Natural Resources (IDNR) submitted a proposed amendment to the Indiana program at Indiana Code (IC) 13–4.1–1 through 13–4.1–6, 13–4.1–6.3 and 13–4.1–14. The proposed amendment consisted of Indiana's 1990 Senate Enrolled Act (SEA) 52, 1991 SEA 46, and 1991 SEA 154. These were received as a single proposed amendment. By letter dated June 5, 1991 (Administrative Record No. IND–0886), Indiana requested the OSM to separately process the statutes as three separate amendments. Consequently, this notice addresses the proposed amendments submitted under Indiana's SEA 52. SEA 52 was adopted during the 1990 Legislative Session and contains revisions to the self-bonding and bond pool fund provisions.

By letter dated March 18, 1988 (Administrative Record No. IND–0559A), Indiana submitted proposed amendments to IC 13–4.1–6.5 which propose to establish the Indiana surface coal mine reclamation bond pool. OSM is currently reviewing the proposed Indiana bond pool amendments. Therefore, the following proposed amendments which were submitted by Indiana under SEA 52, and which concern the proposed Indiana bond pool, have been transferred to and will be reviewed with the proposed bond pool amendment submitted under Administrative Record No. IND–0559A: IC 13–4.1–6.5–4 concerning participation in the bond pool; IC 13–4.1–6.5–6 concerning suspension from the bond pool; IC 13–4.1–6.5–9 concerning use of bond pool funds; and IC 13–4.1–6.5–11(e) concerning bond pool fund committee.

OSM announced receipt of the proposed amendment in the July 9, 1991, **Federal Register** (56 FR 31093), and in the same notice, opened the public comment period and provided opportunity for a public hearing on the adequacy of the proposed amendment. The public comment period ended on August 8, 1991. The scheduled public hearing was not held as no one requested an opportunity to provide testimony.

III. Director's Findings

Set forth below, pursuant to SMCRA and the Federal regulations at 30 CFR 732.15 and 732.17, are the Director's findings concerning the proposed amendment to the Indiana program.

I. 1C 13–4.1–6.3–11, Indemnity Agreement

IC 13–4.1–6.3–11(2) currently requires that corporations applying for a self-bond or corporate guarantors guaranteeing a subsidiary's self-bond must submit an indemnity agreement signed by two corporate officers who are authorized to bind the corporation. Indiana proposes to amend the provision by deleting the "or" which follows "corporations applying for a self-bond" and by adding in its place the word "and," and to delete the word "subsidiary's." Indiana also proposes to add two requirements:

(1) That the director of IDNR must be given an affidavit certifying that the indemnity agreement is valid under all applicable State and Federal laws; and

(2) That a corporate guarantor must give the director of IDNR a copy of the corporate authorization demonstrating that the corporation may guarantee the self-bond and execute the indemnity agreement.

The proposed amendments render the IC 13–4.1–6.3–11(2) to be substantively identical to 30 CFR 800.23(e)(2) concerning self bonding. The Director notes that OSM has previously approved substantively identical amendments to IC 13–4.1–6.3–11(2) on April 23, 1990 (55 FR 15226). The Director finds the proposed amendments to be no less effective than the Federal regulations.

2. IC 13–4.1–6.3–13, Notice of Changes in Financial Condition

Indiana proposes to amend this provision by adding language which requires that if the applicant does not post an alternate form of bond within 90 days, the applicant must cease coal extraction and immediately begin reclamation. The approved Indiana program at 310 IAC 12–0.5–101 defines reclamation to mean those actions taken to restore mined land as required by IC 13–4.1, the Indiana surface coal mining and reclamation operations law, and 310 IAC 12, the Indiana surface coal mining and reclamation operations rules, to an approved postmining land use.

The Federal regulations at 30 CFR 800.16(e)(2) require that if an adequate bond is not posted by the end of the period allowed (not to exceed 90 days), the operator shall cease coal extraction and shall comply with the provisions concerning permanent cessation of operations at 30 CFR 816/817.132 and shall immediately begin to conduct reclamation operations in accordance with the reclamation plan. The Director notes that OSM has previously approved substantively identical amendments to IC 13–4.1–6.3–13 on April 23, 1990 (55 FR 15226). The Director finds that the proposed language is no less effective than the counterpart Federal regulations at 30 CFR 800.23(g).

IV. Summary and Disposition of Comments

Agency Comments

Pursuant to section 503(b) of SMCRA and 30 CFR 732.17(H)(11)(i), comments were solicited from various interested Federal agencies. The U.S. Environmental Protection Agency (EPA) responded that it had no comments and concurred on the proposed changes. The U.S. Fish and Wildlife Service and the U.S. Army Corps of Engineers, Management and Disposal Division responded but had no comments on the proposed amendments.

Public Comments

The public comment period and opportunity to request a public hearing was announced in the July 9, 1991, **Federal Register** (56 FR 31093). The comment period closed on August 8, 1991. No one requested an opportunity to testify at the scheduled public hearing so no hearing was held.

By letter dated August 3, 1991 (Administrative Record No. IND–0927), The Hoosier Environmental Council responded but had no specific comments related to the proposed amendments.

By letter dated August 6, 1991 (Administrative Record No. IND–0925), the Indiana Coal Council, Inc. responded and supported the proposed amendments and said they should be approved. In response, the Director notes that the proposed amendments concerning self-bonding are being approved and that the amendments submitted with SEA 52 that are related to Indiana's proposed bond pool at IC 13–4.1–6.5 have been transferred to and will be reviewed with the proposed bond pool amendment submitted under Administrative Record No. IND–0559A.

V. Director's Decision

Based on the above findings, the Director is approving proposed Program Amendment Number 91–7A as submitted by Indiana on June 4, 1991, with the exceptions of proposed amendments to IC 13–4.1–6.5 concerning the proposed Indiana bond pool. The proposed amendments to IC 13–4.1–6.5 have been transferred to and will be processed with the proposed bond pool amendment submitted under Administrative Record No. IND–0559A.

The Federal regulations at 30 CFR part 914 codifying decisions concerning the Indiana program are being amended to

implement this decision. This final rule is being made effective immediately to expedite the State program amendment process and to encourage the states to conform their programs with the Federal standards without delay. Consistency of State and Federal standards is required by SMCRA.

EPA Concurrence

Under 30 CFR 732.17(h)(ll)(ii), the Director is required to obtain the written concurrence of the Administrator of the Environmental Protection Agency (EPA) with respect to any provisions of a State program amendment that relate to air or water quality standards promulgated under the authority of the Clear Water Act (33 U.S.C. 1251 *et seq.*) or the Clean Air Act (42 U.S.C. 7401 *et seq.*). The Director has determined that this amendment contains no provisions in these categories and that EPA's concurrence is not required. However, EPA responded to the Director's request for comments and stated that EPA had no comments and that it concurred on the proposed amendment (Administrative Record No. IND–0919).

VI. Procedural determinations

National Environmental Policy Act

The Secretary has determined that, pursuant to section 702(d) of SMCRA, 30 U.S.C. 1292(d), no environmental impact statement need be prepared on this rulemaking.

Exective Order 12291 and the Regulatory Flexibility Act

On July 12, 1984, the Office of Management and Budget (OMB) granted OSM an exemption from sections 3, 4, 7, and 8 of Executive Order 12291 for actions directly related to approval or conditional approval of State regulatory programs. Therefore, this action is exempt from preparation of a regulatory impact analysis and regulatory review by OMB.

The Department of the Interior has determined that this rule will not have a significant economic effect on a substantial number of small entities under the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.)*. This rule will not impose any new requirements; rather, it will ensure that existing requirements established by SMCRA and the Federal rules will be met by the State.

Paperwork Reduction Act

This rule does not contain information collection requirements that require approval by the Office of Management and Budget under 44 U.S.C. 3507.

DEPARTMENT OF DEFENSE

Office of the Secretary

32 CFR Chapter I

Administrative Changes

AGENCY: Office of the Secretary, DoD.

ACTION: Final rule.

SUMMARY: The Department of Defense published a final rule revising the heading for subchapter R in title 32 of the Code of Federal Regulations. This document corrects the heading for subchapter R. This document also revises the heading for subchapters L and P.

EFFECTIVE DATE: July 11, 1991.

FOR FURTHER INFORMATION CONTACT: L. Bynum, 703–697–4111 in the **Federal Register** issue of Thursday, July 11, 1991, on page 31537, the heading for subchapter R is corrected to read as follows:

SUBCHAPTER R—ORGANIZATIONAL CHARTERS

SUBCHAPTER L—ENVIRONMENT [RESERVED]

The heading for subchapter L is added as set forth above and reserved.

SUBCHAPTER P—OBTAINING DOD INFORMATION

The heading for subchapter P is revised as set forth above.

Dated: November 20, 1991.⅛

DEPARTMENT OF TRANSPORTATION

Coast Guard

33 CFR Part 100

[CGD 05–91–50]

Special Local Regulations for Marine Events; Holidays in the City Boat Parade; Town Point, Elizabeth River, Norfolk, VA

AGENCY: Coast Guard, DOT.

ACTION: Notice of implementation of 33 CFR 100.501.

SUMMARY: This notice implements 33 CFR 100.501 for the Holiday in the City Boat Parade and Fireworks Display. The event will consist of a boat parade with approximately 80 vessels and a fireworks display at the conclusion of the parade. The regulations in 33 CFR 100.501 are needed to control vessel traffic within the immediate vicinity of the event due to the confined nature of the waterway and the expected congestion at the time of the event. The regulations restrict general navigation in the area for the safety of life and property on the navigable waters during the event.

EFFECTIVE DATES: The regulations in 33 CFR 100.501 are effective from 4:30 p.m. to 8:30 p.m., November 30, 1991.

FOR FURTHER INFORMATION CONTACT: Mr. Stephen Phillips, Chief, Boating Affairs Branch, Boating Safety Division, Fifth Coast Guard District, 431 Crawford Street, Portsmouth, Virginia 23704–5004 (804) 398–6204, or Commander, Coast Guard Group Hampton Roads (804) 483–8559.

Drafting Information

The drafters of this notice are QM1 Kevin R. Connors, project officer.

Boating Affairs Branch, Boating Safety Division, Fifth Coast Guard District, and Lieutenant Monica L. Lombardi, project attorney, Fifth Coast Guard District Legal Staff.

Discussion of Regulation

The Downtown Norfolk Council submitted an application to hold the Holidays in the City Boat Parade and Fireworks Display. The boat parade will be held in the Elizabeth River in the Town Point area between the Banana Landmass and the Berkley Bridge. The fireworks display will be launched from Town Point Park, and will burst over the Elizabeth River. Since many spectator vessels are expected to be in the area to watch the boat parade and fireworks display, the regulations in 33 CFR 101.501 are being implemented for these events. The waterway will be closed during the fireworks display. Since the waterway will not be closed for an extended period, commercial traffic should not be severely disrupted. In addition to regulating the area for the safety of life and property, this notice of implementation also authorizes the Patrol Commander to regulate the operation of the Berkley drawbridge in accordance with 33 CFR 117.1007, and authorizes spectators to anchor in the special anchorage areas described in 33 CFR 110.72aa. The implementation of 33 CFR 100.501 also implements regulations in 33 CFR 110.72aa and 117.1007. 33 CFR 110.72aa establishes the spectator anchorages in 33 CFR 100.501 as special anchorage areas under Inland Navigation Rule 30, 33 U.S.C. 2030(g). 33 CFR 117.1007 closes the draw of the Berkley Bridge to vessels during and for one hour before and after the effective period under 33 CFR 100.501, except that the Coast Guard Patrol Commander may order that the draw be opened for commercial vessels.

Dated: November 20, 1991.

W.T. Leland,

Rear Admiral, U.S. Coast Guard Commander, Fifth Coast Guard District.

[FR Doc. 91-28489 Filed 11-26-91; 8:45 am]

BILLING CODE 4910-14-M

---

33 CFR Part 117

[CGD1 91-004]

Drawbridge Operation Regulations, Saugus River, MA

AGENCY: Coast Guard, DOT.

ACTION: Final rule.

SUMMARY: At the request of the Metropolitan District Commission (MDC) the Coast Guard is changing the regulations governing the General Edwards SR1A Bridge, mile 1.7, between Revere and Lynn, Massachusetts, over the Saugus River, by revising the hours when advance notice for an opening is required. This final rule will relieve the bridge owners of the burden of having persons constantly available to open the draws during periods of infrequent use and should still provide for the reasonable needs of navigation.

DATES: These regulations become effective on December 1, 1991.

FOR FURTHER INFORMATION CONTACT: William C. Heming, Bridge Administrator, First Coast Guard District, (212) 668-7170.

SUPPLEMENTARY INFORMATION: Drafting Information: The drafters of this notice are Mr. John McDonald, Project Officer, and Lieutenant Commander John Astley, project attorney.

Regulatory History

On 24 June, 1991, the Coast Guard published proposed rules in the **Federal Register** (56 FR 121), concerning this amendment. The Commander, First Coast Guard District, also published the proposal as a Public Notice dated July 3, 1991. In each notice interested persons were given until August 8, 1991, to submit comments.

Background and Purpose

The proposed regulations addressed the operation of all bridges over the Saugus River, including the MBTA/AMTRAK Bridge, mile 2.1 and the Belden Bly Bridge, mile 2.5, as well as the General Edwards SR1A Bridge. The Coast Guard received a number of adverse comments in opposition to this regulation. The District Commander has authorized a public hearing to collect data to resolve differences between various factions who support or oppose this regulation.

Mariners objected to having the bridges closed for any period of time because they could not pass under either the MBTA/AMTRAK or the Belden Bly Bridge at all stages of the tide. The mariners, however, did not submit adverse comments regarding the portion of the regulations pertaining to the General Edwards SR1A Bridge. This is primarily because the commercial and recreational vessels that use the Saugus River from December 1 to March 31, can pass under the General Edwards SR1A Bridge, which has a vertical clearance of 36′ at mean low water (MLW) and 27′ at mean high water (MHW).

In light of the above, as well as the fact that the issues to be resolved at the public hearing will not affect the implementation of that portion of the proposed regulation which pertains to the General Edwards SR1A Bridge, the Coast Guard has decided to promulgate that portion of the regulation regarding the General Edwards SR1A Bridge only. The final rule requires that mariners seeking to open the General Edwards SR1A Bridge must give an 8 hour advance notice from December 1 to March 31. This action will relieve the bridge owners of the burden of having persons constantly available to open the draws during periods of infrequent use, while at the same time still provide for the reasonable needs of navigation.

Discussion of Comments and Changes

The Coast Guard received a petition signed by 147 of the local mariners in opposition to the proposed regulation. Their opposition to the regulations was primarily directed at the portion of the proposed regulations that required the mariners to give advance notice for bridge openings at the MBTA/AMTRAK Bridge and the Belden Bly Bridge. This is because their vessels can not pass under these two bridges at all stages of the tide. However, all the mariners that use the Saugus River during the winter months can pass under the General Edwards SR1A Bridge at all times without a bridge opening. The vertical height of their boats is between 16′ to 22′, while the General Edwards SR1A Bridge has a clearance of 36′ at MLW and 27′ at MHW.

The enactment of this final rule should have no adverse impact on the mariners that use the Saugus River because the final rule will only implement the portion of the proposed rule that pertains to the General Edwards SR1A Bridge. The issues surrounding the proposed regulations for the MBTA/AMTRAK Bridge and the Belden Bly Bridge will be addressed at a public hearing and in subsequent rulemaking.

Regulatory Evaluation

These regulations are considered to be non-major under Executive Order 12291 on Federal Regulation, and nonsignificant under the Department of Transportation regulatory policies and procedures (44 FR 11034; February 26, 1979). The economic impact is expected to be so minimal that a full regulatory evaluation is unnecessary. This opinion is based on the fact that the regulation will not prevent the mariners from transiting the bridges but shall just require advance notice for openings.

Small Entities

Because it expects the impact of these regulations to be minimal, the Coast Guard certifies under 5 U.S.C. 605(b) of the Regulatory Flexibility Act (5 U.S.C.

601 *et seq.*) that this final rule will not have a significant economic impact on a substantial number of small entities.

Collection of Information

This rule contains no collection of information requirements under the Paperwork Reduction Act (44 U.S.C. 3501 *et seq.*).

Federalism

This action has been analyzed under the principles and criteria in Executive Order 12612, and it has been determined that this rule does not have sufficient federalism implications to warrant preparation of a federal assessment.

Environment

The Coast Guard considered the environmental impact of this rule and concluded that, under section 2.B.2 of Commandant Instruction M16475.1B, this proposal is categorically excluded from further environmental documentation. A Categorical Exclusion Determination is available in the docket for inspection or copying at the John Foster Williams Building, room 628, 408 Atlantic Ave., Boston, Massachusetts.

List of Subjects in 33 CFR Part 117

Bridges.

Regulations

In consideration of the foregoing, part 117 of Title 33, Code of Federal Regulations, is amended as follows:

PART 117—DRAWBRIDGE OPERATION REGULATIONS

1. The authority citation for part 117 continues to read as follows:

Authority: 33 U.S.C. 499; 49 CFR 1.46; 33 CFR 1.05–1(g).

2. Section 117.618 is revised to read as follows:

§ 117.618 Saugus River.

(a) The following requirements apply to all bridges across the Saugus River:

(1) Public vessels of the United States, state or local vessels used for public safety, and vessels in distress shall be passed through the draw of each bridge as soon as possible at any time. The opening signal from these vessels is four or more short blasts of a whistle or horn or a radio request.

(2) The owners of these bridges shall provide and keep in good legible condition clearance gauges with figures not less than 12 inches high designed, installed and maintained according to provisions of § 118.160 of this chapter.

(3) Trains and locomotives shall be controlled so that any delay in opening the draw span shall not exceed seven minutes. However, if a train moving toward the bridge has crossed the home signal for the bridge before the signal requesting opening of the bridge is given, the train may continue across the bridge and must clear the bridge interlocks before stopping.

(b) The draw of the General Edwards SR1A Bridge, mile 1.7, between Revere and Lynn, Massachusetts, shall open on signal except that from December 1 through March 31 at least 8 hour advance notice shall be given by commercial and recreational vessels for an opening.

3. Appendix A to part 117 is amended to add the Saugus River listings under the State of Massachusetts between the listings for Merrimack River and the Taunton River to read as follows:

APPENDIX A TO PART 117.—DRAWBRIDGES EQUIPPED WITH RADIOTELEPHONES

Waterway	Mile	Location	Bridge name and owner	Call sign	Calling channel	Working channel

BILLING CODE 4910-14-M

LIBRARY OF CONGRESS

Copyright Office

37 CFR Part 202

[Docket No. 91-13]

Deposit of Foreign Works

AGENCY: Library of Congress, Copyright Office.

ACTION: File rule.

SUMMARY: The Copyright Office of the Library of Congress is issuing a final regulation which permits, in the case of works first published outside the United States, the deposit of either one complete copy or phonorecord of the work as first published or one complete copy of the best edition, for purposes of registration under 17 U.S.C. 408.

EFFECTIVE DATE: November 27, 1991.

FOR FURTHER INFORMATION CONTACT: Dorothy Schrader (202) 707-8380.

SUPPLEMENTARY INFORMATION: In the case of works first published outside the United States, Copyright Office regulations have required the deposit of one complete copy or phonorecord of the work as first published for registration of a claim to copyright under section 408 of the Copyright Act, title 17 of the United States Code. For works first published in the United States, the required deposit is the best edition. This difference in the regulations has led to confusion about the correct deposit. The best edition is often submitted for registration of foreign works.

The Copyright Office is amending § 202.20(c)(1)(iv) of its regulations to permit the deposit, in the case of registration for works first published outside the United States, of either one copy or phonorecord of the first published edition or one copy or phonorecord of the best edition. No change was necessary in § 202.19 of the regulations governing mandatory deposit under section 407 of the Act for the Library of Congress. Of course, deposits made under amended § 202.20(c)(1)(iv) for registration will continue to meet the deposit requirements of section 407 for the Library. Deposit for the Library, where the foreign work is published in the United States and no registration has been made, will continue to require the deposit of the best edition.

With respect to the Regulatory Flexibility Act, the Copyright Office takes the position that this Act does not

apply to Copyright Office rulemaking. The Copyright Office is a department of the Library of Congress, which is part of the legislative branch. Neither the Library of Congress nor the Copyright Office is an "agency" within the meaning of the Administrative Procedure Act of June 11, 1946, as amended (title 5, of U.S. Code, subchapter II and chapter 7). The Regulatory Flexibility Act consequently does not apply to the Copyright Office since that Act affects only those entities of the Federal Government that are agencies as defined in the Administrative Procedure Act.[1]

Alternatively, if it is later determined by a court of competent jurisdiction that the Copyright Office is an "agency" subject to the Regulatory Flexibility Act, the Register of Copyrights has determined and hereby certifies that this regulation will have no significant impact on small businesses.

List of Subjects in 37 CFR Part 202

Copyright registration.

Final Regulation

In consideration of the foregoing, part 202 of title 37 of the Code of Federal Regulations is amended in the manner set forth below.

PART 202—REGISTRATION OF CLAIMS TO COPYRIGHT

1. The authority citation for part 202 continues to read as follows:

Authority: Sections 702, 90 Stat. 2451; 17 U.S.C. 702. §§ 202.19, 202.20, and 202.21 are also issued under 17 U.S.C. 407 and 408.

2. In § 202.20, paragraph (c)(1)(iv) is revised to read as follows:

§ 202.20 Deposit of copies and phonorecords for copyright registration.

* * * * *

(c) * * *

(1) * * *

(iv) In the case of works first published outside of the United States, one complete copy or phonorecord of the work either as first published or of the best edition. For purposes of this section, any works simultaneously first published within and outside of the United States shall be considered to be first published in the United States.

Register of Copyrights.

Approved by:

James H. Billington,

The Librarian of Congress.

[FR Doc. 91-28423 Filed 11-26-91; 8:45 am]

BILLING CODE 1410-07-M

[1] The Copyright Office was not subject to the Administrative Procedure Act before 1978, and it is now subject to it only in areas specified by section 701(d) of the Copyright Act (i.e. "all actions taken by the Register of Copyrights under this title (17), except with respect to the making of copies of copyright deposits) (17 U.S.C. 706(b)). The Copyright Act does not make the Office an "agency" as defined in the Administrative Procedure Act. For example, personnel actions taken by the Office are not subject to APA-FOIA requirements.

FEDERAL EMERGENCY MANAGEMENT AGENCY

44 CFR Part 64

[Docket No. FEMA 7528]

List of Communities Eligible for the Sale of Flood Insurance

AGENCY: Federal Emergency Management Agency.

ACTION: Final rule.

SUMMARY: This rule identifies communities participating in the National Flood Insurance Program (NFIP). These communities have applied to the program and have agreed to enact certain floodplain management measures. The communities' participation in the program authorizes the sale of flood insurance to owners of property located in the communities listed.

EFFECTIVE DATES: The dates listed in the third column of the table.

ADDRESSES: Flood insurance policies for property located in the communities listed can be obtained from any licensed property insurance agent or broker serving the eligible community, or from the National Flood Insurance Program (NFIP) at: Post Office Box 457, Lanham, Maryland 20706, Phone: (800) 638-7418.

FOR FURTHER INFORMATION CONTACT: Frank H. Thomas, Assistant Administrator, Office of Loss Reduction, Federal Insurance Administration, (202) 646-2717, Federal Center Plaza, 500 C Street SW., room 417, Washington, DC 20472.

SUPPLEMENTARY INFORMATION: The National Flood Insurance Program (NFIP), enables property owners to purchase flood insurance which is generally not otherwise available. In return, communities agree to adopt and administer local floodplain management measures aimed at protecting lives and new construction from future flooding. Since the communities on the attached list have recently entered the NFIP, subsidized flood insurance is now available for property in the community.

In addition, the Director of the Federal Emergency Management Agency has identified the special flood hazard areas in some of these communities by publishing a Flood Hazard Boundary Map (FHBM) or a Flood Insurance Rate Map (FIRM). The date of the flood map, if one has been published, is indicated in the fourth column of the table. In the communities listed where a flood map has been published, section 102 of the Flood Disaster Protection Act of 1973, as amended, requires the purchase of flood insurance as a condition of Federal or federally related financial assistance for acquisition or construction of buildings in the special flood hazard area shown on the map.

The Director finds that the delayed effective dates would be contrary to the public interest. The Director also finds that notice and public procedure under 5 U.S.C. 553(b) are impracticable and unnecessary.

The Catalog of Domestic Assistance Number for this program is 83.100 "Flood Insurance."

Pursuant to the provisions of 5 U.S.C. 605(b), the Administrator, Federal Insurance Administration, to whom authority has been delegated by the Director, FEMA, hereby certifies that this rule, if promulgated will not have a significant economic impact on a substantial number of small entities. This rule provides routine legal notice stating the community's status in the NFIP and imposes no new requirements or regulations on participating communities.

List of Subjects in 44 CFR Part 64

Flood insurance and floodplains.

1. The authority citation for part 64 continues to read as follows:

Authority: 42 U.S.C. 4001 *et seq.*, Reorganization Plan No. 3 of 1978, E.O. 12127.

2. Section 64.6 is amended by adding in alphabetical sequence new entries to the table.

In each entry, a complete chronology of effective dates appears for each listed community. The entry reads as follows:

§ 64.6 List of Eligible Communities.

BILLING CODE 6718-21-M

DEPARTMENT OF DEFENSE

48 CFR Parts 208, 209, 211, 215, 219, 223, 225, 226, 231, 232, 233, 235, 237, 242, 243, 247, 249, 250, 252

[Defense Acquisition Circular (DAC) 88-19]

Department of Defense Acquisition Regulations; Miscellaneous Amendments

AGENCY: Department of Defense (DoD).

ACTION: Final rules.

SUMMARY: Defense Acquisition Circular (DAC) 88-19 amends the DoD FAR Supplement (DFARS) (1988 Edition) coverage on restriction on antifriction bearings, liquidated damages—Small Business Subcontracting Test Program, historically black colleges and universities and minority institutions, hazard warning labels, drugfree work force, logistics support for contractor personnel in Germany and Italy, Trade Agreements Act, duty-free entry, Indian Incentive Program, expedited payments to small disadvantaged businesses, GAO protest regulations, approval of fixed price development contracts, notification of substantial impact on employment, extraordinary contractual actions, and suspension and debarring officials.

EFFECTIVE DATE: November 15, 1991.

FOR FURTHER INFORMATION CONTACT: Ms. Lucile Hughes, Defense Acquisition Regulations System, OUSD(A), The Pentagon, Washington, DC 20301-3000, telephone (703) 697-7266.

SUPPLEMENTARY INFORMATION:

A. Background

The DoD FAR Supplement is codified in chapter 2 title 48 of the Code of Federal Regulations.

The October 1, 1990 revision of the CFR is the most recent edition of that title. It includes amendments to the 1988 edition of the DoD FAR Supplement made by Defense Acquisition Circulars 88-1 through 88-15.

The looseleaf version of Defense Acquisition Circular 88-19 contains 18 final rules, four interim rules, and two informational items (Items II and X). Of the 18 final rules, six finalize interim rules (Items V, IX, XI, XII, XIX, and XXII). Due to their previous publication in the **Federal Register**, Items III, IV, VII, XIII, XIV, XVII, and XX of DAC 88-19 appear in the looseleaf version of DAC 88-19 but not in the CFR amendments of this **Federal Register** notice.

The interim rules included in DAC 88-19 (Items III, IV, XIII, and XX) were published previously in the **Federal Register** for public comment. Their publication in the looseleaf version of DAC 88-19 does not constitute a request for comment.

Item III was published April 12, 1991 (56 FR 18610).

Item IV was published September 5, 1991 (56 FR 43986) and amended September 30, 1991 (56 FR 49506).

Item XIII was published July 25, 1991 (56 FR 34030).

Item XX was published October 18, 1991 (56 FR 52440).

Three of the final rules included in the looseleaf version of DAC 88-19 were finalized in previous **Federal Register** publications.

Item VII was published August 9, 1991 (56 FR 37963).

Item XIV was published September 12, 1991 (56 FR 46520).

Item XVII was published July 10, 1991 (56 FR 31341).

B. Regulatory Flexibility Act

DAC 88–19, Items I, VI, XV, XVI, XVIII, XXI and XXIV

These final rules do not constitute significant revisions within the meaning of FAR 1.501 and Public Law 98–577 and publication for public comment is not required. Therefore, the Regulatory Flexibility Act does not apply.

DAC 88–19, Item V

The Department of Defense certifies that this final rule will not have a significant economic impact on a substantial number of small entities under the Regulatory Flexibility Act, 5 U.S.C. 601 et seq., because the rule is being used under a test program which has very limited application. There were no comments received in response to the April 15, 1991 interim rule publication (56 FR 15162) which addressed the Regulatory Flexibility Statement.

DAC 88–19, Item VIII

The Department of Defense certifies that this final rule will not have a significant economic impact on a substantial number of small entities under the Regulatory Flexibility Act, 5 U.S.C. 601 et seq., because it requires offerors or contractors merely to generate and furnish before and with their product, a hazard warning label which they are already required to do under 29 CFR 1910.1200. Therefore, the time and financial resources necessary to comply with the proposed requirement are already invested prior to any involvement in contracting with the Government.

DAC 88–19, Item IX

The Regulatory Flexibility Act, 5 U.S.C. 601 et seq. applies to this final rule and a Final Regulatory Flexibility Analysis has been performed. A copy of the analysis may be obtained by writing Defense Acquisition Regulations System, Attn: Linda Neilson, OUSD(A), Pentagon, Washington, DC 20301–3000.

DAC 88–19, Item XI

The Department of Defense certifies that this final rule will not have a significant economic impact on a substantial number of small entities under the Regulatory Flexibility Act, 5 U.S.C. 601 et seq., because it provides more opportunity for participation of small firms by adopting the substantially transformed criteria of the Trade Agreements Act.

DAC 88–19, Item XII

The Department of Defense certifies that this final rule will not have a significant economic impact on a substantial number of small entities under the Regulatory Flexibility Act, 5 U.S.C. 601 et seq., because it merely adds one element of readily available information, contractor's address, to that already required.

DAC 88–19, Item XIX

The Department of Defense certifies that this final rule will not have a significant economic impact on a substantial number of small entities under the Regulatory Flexibility Act, 5 U.S.C. 601 et seq., because it implements GAO's revised protest procedures (4 CFR part 21) by incorporating those procedures which are essential information for contracting officers. It does not impact the involvement of small entities in the GAO protest process.

DAC 88–19, Item XXII

The Regulatory Flexibility Act, 5 U.S.C. 601 et seq. applies to this final rule and a Final Regulatory Flexibility Analysis has been performed. A copy of the analysis may be obtained by writing Defense Acquisition Regulations System, Attn: Eric Mens, OUSD(A), Pentagon, Washington, DC 20301–3000.

DAC 88–19, Item XXIII

The Regulatory Flexibility Act, 5 U.S.C. 601 et seq., applies to this final rule and a Final Regulatory Flexibility Analysis has been performed. A copy of the analysis may be obtained by writing Defense Acquisition Regulations System, Attn: Valorie Lee, OUSD(A), Pentagon, Washington, DC 20301–3000.

C. Paperwork Reduction Act

DAC 88–19, Items I, V, VI, VIII, XI, XV, XVI, XVIII, XIX, XXI, XXIII, and XXIV

The Paperwork Reduction Act does not apply because these rules do not contain information collection requirements which require the approval of OMB under 44 U.S.C. 3501 et seq.

DAC 88–19, Item IX

The Paperwork Reduction Act applies. OMB approval has been requested.

DAC 88–19, Item XII

The Paperwork Reduction Act applies. OMB has approved the information collection under Department of the Treasury clearance 1515–0170.

DAC 88–19, Item XXII

The Paperwork Reduction Act applies. OMB approved the information collection requirement on the interim rule (OMB 0704–0327) for the period ending September 30, 1991. OMB approval of the final rule has been requested.

List of Subjects in 48 CFR Parts 208, 209, 211, 215, 219, 223, 225, 226, 231, 232, 233, 235, 237, 242, 243, 247, 249, 250, and 252

Government procurement.

Claudia L. Naugle,

Executive Editor, Defense Acquisition Regulations System.

(Defense Acquisition Circular No. 88–19, dated November 15, 1991)

All DoD FAR Supplement and other directive material contained in this circular is effective November 15, 1991, unless otherwise specified in the Item summary.

Defense Acquisition Circular (DAC) 88–19 amends the DoD FAR Supplement (DFARS) 1988 edition, prescribes procedures to be followed, and provides informational interest items. The amendments, procedures, and information are summarized as follows:

Item I—Editorial Revision

DFARS 209.470(b) is amended to update the designation of Navy suspending and debarring official.

Item II—Restriction on Antifriction Bearings

The restriction in DFARS 208.7902 on the acquisition of antifriction bearings has been extended from September 30, 1991 until December 31, 1992. Except for the date, there is no change to the related policy, the clause at 252.208–7006, Required Sources for Antifriction Bearings, or to the clause prescription at 208.7905.

Item III—Acquisition and Distribution of Commercial Products

This interim rule was issued by Departmental Letter 91–007, effective for use April 30, 1991, as implementation of Section 824(b) of the FY 90–91 National Defense Authorization Act (Pub. L. 101–189). Section 824(b) requires that DoD establish a simplified uniform contract format for the acquisition of commercial items and require the use of such format to the maximum extent practicable. This interim rule added DFARS subpart 211.70, Acquisition and Distribution of Commercial Products, and added clauses at 252.211–7000 through 252.211–7021. It:

—Prohibits Government specified quality systems or quality programs.
—Restricts Government in-plant inspection. (Tailored inspection requirements are permitted for items having critical applications.
—Prohibits the use of Government specified designs, manufacturing processes or procedures.
—Prohibits the use of Military Standards or Military Specifications

that would impede a commercial supplier's ability to satisfy a DoD requirement.
—Requires packaging and marking in accordance with commercial practices.
—Limits the acquisition of technical data.
—Requires commercial computer software to be acquired under the same licensing agreements provided to the general public.
—Prohibits unilateral specification changes.
—Restricts the number of Government clauses contractors must flow down to their subcontractors or suppliers.
—Reduces the number of contract clauses that may be used in a DoD contract for commercial items.

The interim rule was modified by Departmental Letter 91–020, issued September 26, 1991, which advised that the clause at 252.211–7005, Limitation of Liability, may not be appropriate for use in all contracts for commercial items and shall not be used in part 211 contracts, pending issuance of the part 211 final rule. In the meantime, in contracts for commercial automatic data processing equipment, contracting officers are to follow the guidance in DFARS 270.310(a) and use the clause at 252.270–7001, Warranty Exclusion and Limitation of Damages, unless the contracting officer determines that a higher degree of protection is in the best interest of the Government. In contracts for all other commercial items, contracting officers are to follow the guidance at FAR Subpart 46.8, and may use the Limitation of Liability clauses at FAR 52.246–23 and 52.246–24 or other liability clauses authorized for use by a Military Department or Defense Agency.

Item IV—Evaluation of Acquisitions for Services and Uncompensated Overtime

Departmental Letter 91–017, dated August 19, 1991, revised DFARS subparts 215.6 and 237.1 and added a solicitation provision entitled "Identification of Uncompensated Overtime" as interim implementation of Section 834 of the FY 1991 DoD Authorization Act (Pub. L. 101–510). Section 834 requires the Secretary of Defense to issue regulations to ensure, to the maximum extent practicable, that professional and technical services are acquired on the basis of the task to be performed rather than on the basis of the number of hours provided. The DFARS revisions include guidance on evaluation of service acquisitions and on factors to consider in evaluating proposals to ensure that the use of uncompensated overtime does not degrade the level of technical expertise required. Language and a solicitation provision have been added on the use of uncompensated overtime. The new provision is to be used in all solicitations estimated at $100,000 or more for services to be acquired on the basis of the number of hours to be provided. These DFARS revisions were effective August 19, 1991.

Item V—Liquidated Damages—Small Business Subcontracting Test Program

This finalizes, without change, the interim revisions made to DFARS 219.702, 219.708, and 252.219–7016 by DAC 88–18, Item III. The revisions suspend application of liquidated damages to comprehensive subcontracting plans submitted under the test program described in DFARS 219.702. The revisions were effective March 4, 1991.

Item VI—Historically Black Colleges and Universities and Minority Institutions

DFARS 219.705–2, 226.7001, and 226.7003 are revised to implement section 832 of the FY 1991 DoD Authorization Act (Pub. L. 101–510). Section 832 provides for further enhancement of opportunities for participation of historically black colleges and universities and minority institutions in DoD programs.

Item VII—Pilot Mentor-Protege Program

Departmental Letter 91–016, dated July 31, 1991, revised DFARS 232.412 and added subpart 219.71 and the clause at 252.232–7009 to implement section 831 of the FY 1991 Defense Authorization Act (Pub. L. 101–510), as amended. Section 831 required that DoD establish a test program offering incentives to major contractors which provide developmental assistance to small disadvantaged businesses. Policy and procedures for operation of the test program are described in detail in a DoD policy document entitled "DoD Policy For the Pilot Mentor-Protege Program," a copy of which is included in this Defense Acquisition Circular. The DFARS amendments were effective October 1, 1991.

Item VIII—Hazard Warning Labels

DFARS subpart 223.72 is revised and a solicitation provision and clause are added as 252.223–7006 and 252.223–7007 to require that offerors identify hazardous materials which are not subject to the Hazard Communications Standard and to require that apparent successful offerors submit before award, labels for those materials which are subject to the Hazard Communications Standard.

IX—Drug-Free Work Force

This final rule replaces the interim rule published in DAC 88–2. It removes all language that duplicated the Drug-Free Workplace rule in FAR subpart 23.5 and it eliminates any ambiguity as to whether drug testing is required.

Item X—Logistics Support for Contractor Personnel in Germany and Italy

The United States Army, Europe (USAREUR) and Seventh Army grant logistics support and privileges to certain DoD contractor personnel under contracts performed in the Federal Republic of Germany and Italy. A USAREUR updated notice, superseding the notice published under Item I of DAC 88–11, of the support and privileges available is included as Attachment 2 to this DAC.

Item XI—Trade Agreements Act

This finalizes, without change, the interim revisions made by DAC 88–17, Item VII, to part 225, the clauses at 252.225–7001, Buy American Act and Balance of Payments Program, and 252.225–7006, Trade Agreements Act, and the provision at 252.225–7005, Buy American Act-Trade Agreements Act-Balance of Payments Program Certificate. The revision incorporated a definition of U.S. made end products that covers products substantially transformed in the United States but which do not qualify as domestic end products.

Item XII—Duty-Free Entry

This finalizes, without change, the interim revisions made by DAC 88–17, Item VIII, to DFARS 225.603–70, 252.225–7008, and 252.225–7014. The revisions added additional information necessary for processing duty-free certificates. Item VIII of DAC 88–17 mistakenly attributed the origin of this additional information requirement to a new paperless system of the U.S. Customs Service when in actuality the requirement is in support of the Defense Logistics Agency's Duty Free Entry Management System.

Item XIII—Offset Administrative Costs

DFARS 225.7304 was revised on an interim basis by Departmental Letter 91–015, dated July 15, 1991, to permit defense contractors to recover allowable offset administrative costs from foreign governments under foreign military sales contracts. This revision was effective July 15, 1991.

Item XIV—IR&D/B&P Costs

This final rule was effective August 19, 1991, upon issuance of Departmental Letter 91–018. DFARS Parts 225, 231, and 242 were revised to implement Section 824 of the FY 1991 DoD Authorization Act (Pub. L. 101–510) by incorporating the new, broader standard for IR&D/B&P projects which are of "potential interest to DoD" and to make other related changes. DFARS 225.7304(c)(2) was revised to remove an inconsistency that currently exists with 225.7304(c)(3). DFARS 225.7304(c)(3) was revised to incorporate the new 10 U.S.C. 2372 citation and to correct an erroneous reference to IR&D/B&P ceiling limitations or formula constraints as being contained in DFARS Part 231, rather than in FAR part 31. DFARS 231.205–18 incorporates the new, broader legislative standard for IR&D/B&P projects which are of "potential interest to DoD," including the specific examples of such projects listed in 10 U.S.C. 2372(c). DFARS 242.1005(a) was added to clarify that the DoD IR&D Technical Evaluation Group is responsible for providing appropriate guidance to contractors for submission of technical information to support IR&D proposals. DFARS 242.1005(b) was revised to clarify that the DoD IR&D Technical Evaluation Group is responsible for providing contracting officers with the required technical evaluation, including an opinion concerning the potential interest of the proposed IR&D projects to DoD. DFARS 242.1005(c), 242.1006, and 242.1007 were revised to incorporate the new standard of "potential interest to DoD" and to otherwise satisfy the requirements of 10 U.S.C. 2372. DFARS 242.1008 was revised to reflect current organizations and titles within DoD.

Item XV—Indian Incentive Program

DFARS Subpart 226.71 and the clause at 252.226–7002 are removed as they were incorporated in FAR Part 26 by FAC 90–07, Item VIII.

Item XVI—Foreign Selling Costs

This item is to clarify the effective date of Item K of DAC 88–18. The deletion of DFARS 231.205–1 and 231.205–38, accomplished under Item X of DAC 88–18, was effective May 15, 1991, upon effectivity of the comparable FAR language published as Item XVIII of FAC 90–04.

Item XVII—Customary Progress Payment Rates

This item was effective July 1, 1991, upon issuance of Departmental Letter 91–014. DFARS 232.5 is revised and a clause added at 252.232–7008 to implement DoD's customary uniform progress payment rates for contracts awarded on or after July 1, 1991 through March 31, 1992. Rates for subsequent years will be published in the first quarterly DAC for the calendar year. The customary uniform rates for July 1, 1991 through March 31, 1992, are 85 percent for large business, 90 percent for small business, and 95 percent for small disadvantaged business. This change does not affect progress payment rates for the repair, maintenance, or overhaul of naval vessels which are governed by rates established by the Secretary of the Navy in accordance with 10 U.S.C. 7312, as amended. For flow-down to subcontractors, refer to (j)(4) of the progress payments clause at FAR 52.232–16. Implement the revised rates as follows:

1. *Existing Contracts.* In no event will an existing contract be modified to incorporate the revised rates.

2. *Contract Awards in Process.* If a contract price has been agreed to and the contract is scheduled for award on or after July 1, 1991, you may include a revised rate in the contract if the contract price is reduced to reflect the price consideration received from the contractor for the revised rate. However, in competitive procurements where "Best and Final" offers or sealed bids have been received, no change should be made to the financing terms contained in the solicitation or invitation for bid.

3. *Modifications to Existing Contracts.* Contract modifications (e.g., supplemental agreements, changes, exercise of priced options, definitization of letter contracts, etc.) to existing contracts for inscope effort will be financed at the rate established in the existing contract.

4. *Basic Ordering Agreements.* Prompt action should be taken by the contracting officer to modify basic ordering agreements to incorporate the new contract financing rates for orders issued on or after July 1, 1991.

5. *Letter Contracts.* You may include a revised rate in the contract if the price is negotiated on or after July 1, 1991, based on the revised rate.

Item XVIII—Expedited Payments to Small Disadvantaged Businesses

This final rule adds DFARS 232.903 and 232.905–70 to implement a decision by the Under Secretary of Defense for Acquisition to assist small disadvantaged business concerns by authorizing and encouraging DoD payment offices to pay such concerns as quickly as possible after invoices are received and prior to payment due dates.

Item XIX—GAO Protest Regulations

This finalizes, without change, the interim rule that was published in Departmental Letter 91–019 and was effective August 23, 1991. The interim rule added DFARS 233.104, implementing the General Accounting Office's (GAO) revised protest procedures (4 CFR part 21), which went into effect on April 1, 1991. The DFARS language covers only those portions of GAO's revised rules which pertain to contracting officers and is to be used until a permanent FAR change is made.

DFARS 233.104, which is a substantial rewrite and is to be used in lieu of FAR 33.104, implements GAO's revised procedures, presents procedures in a more logical order, and makes other editorial improvements. The most significant procedures address the information an agency is required to provide to GAO, protective orders issued by GAO, and formal fact-finding hearings.

Agency reports to the GAO must now include all evaluation documents. In addition, agencies must also make available to GAO any document specifically requested by the protestor. GAO's new rules provide interested parties with easier access to documents. Accordingly, DFARS 233.104(a)(5) addresses requests for, and GAO issuance of, protective orders to limit the right to use and disclose released documents. DFARS 233.104(e) gives notice of GAO's formal fact-finding hearings, with minimal discussion of the detailed procedures.

Item XX—Contracting Officer Final Decisions

This interim rule was effective October 4, 1991, upon issuance of Departmental Letter 91–021. The interim rule adds Section 233.211 to require contracting officers to insert a "note" in all contracting officer final decisions, immediately following the paragraph required by FAR 33.211(a)(4)(v). The note advises the contractor to refer to a recent Circuit Court decision which may affect the contractor's choice of a forum for appeal.

Item XXI—Approval of Fixed-Price Development Contracts

DFARS 235.006 was revised by Departmental Letter 91–009, dated May 2, 1991, to require a determination by the

Under Secretary of Defense for Acquisition (USD(A)) before award, using FY 1991 funds, of a fixed price type contract over $10 million for development of a major system, or subsystem thereof. We previously published a revision to DFARS 235.006 in DAC 88–16 that requires a determination by the USD(A) before 1990 funds can be obligated on a fixed-price development contract in excess of $10 million for development of a major system or subsystem. Section 8038 of the FY 1991 DoD Appropriations Act (Public Law 101–511) contains the same requirement before FY 1991 funds can be obligated.

Item XXII—Notification of Substantial Impact on Employment

This final rule supersedes the interim rule published in Departmental Letter 91–011 on May 14, 1991. DFARS subparts 243, 249, and 252 are revised to implement section 4201 of the FY 1991 DoD Authorization Act (Pub. L. 101–510). Section 4201 requires the Secretary of Defense to notify the Secretary of Labor if the modification or termination of a major defense contract or subcontract will have a substantial impact on employment.

The rule requires reporting on modifications or convenience terminations of prime contracts valued at $5 million or more, or subcontracts of $500,000 or more, which will have a substantial impact on employment. Contracting officers must either modify existing contracts to incorporate the clause at 252.249–7001, Notification of Substantial Impact on Employment, or tailor any termination notices that are subsequently issued against these contracts to request the contractor to provide a statement of impact on employment.

The final rule differs from the interim rule in that:

1. The phrase "for convenience" has been added to DFARS 243.107(S–70), 249.102(a)(5), 249.7003(a), the title at 249.7003, and 252.249–7001 (b) and (c), to make it clear that the notification requirement applies to terminations for convenience and not to terminations for default.

2. Time frames for notification have been added to the text and clause. The contractor must notify the contracting officer within 30 calendar days if the proposed modification or termination for convenience will have a substantial impact on employment (249.102(a)(5) and 252.249–7001(c)). The head of the contracting activity must provide the notification to the Office of Economic Adjustment (OEA) within ten work days (249.7003(b)).

3. DFARS 249.7003(b)(1) has been added to require that the contractor notices include the data elements specified in paragraph (c) of the clause at 252.249–7001. As an option, contractors may use a new DD Form 2604, Notification of Substantial Impact, to provide the requisite notice (252.249–7001(c)).

4. DFARS 249.7003(b)(2) has been added to provide contracting activities with the appropriate mail and telefax address for the submission of notices to OEA.

5. DFARS 252.249–7001(a)(1)(ii) has been revised to remove the phrase "awarded under the prime" to make it consistent with the prescriptive language at 249.7003(c) and to make it clear that the text and clause apply to all subcontracts of $500,000 or more.

Item XXIII—Liability for Personal Property Shipments

DFARS 247.271–4(b)(9) and the clause at 252.247–7110 are revised to modify the contractor's liability for loss or damage to personal property picked up or delivered under Schedule III, Intra-City and Intra-Area, of the Personal Property Management Regulation, DoD 4500.34–R. Under this modification, the contractor must be notified within 75 days (instead of a year) following delivery and the contractor is liable for depreciated value (rather than replacement value) but the maximum liability is increased from $.60 per pound per article to $1.25 per pound times the net weight of the shipment.

Item XXIV—Extraordinary Contractual Actions

DFARS 250.103, Deviations, is deleted as unnecessary because FAR subpart 1.4 and DFARS subpart 1.4 provide adequate policies and procedures for deviations. The language in FAR 50.103 was deleted by FAC 90–07, Item XII.

Interim Rules Adopted as Final Without Change

PARTS 219 AND 252 [AMENDED]

219.702, 219.708, 252.219–7016 [Amend]

1. Accordingly, the interim rules amending sections 219.702, 219.708, and 252.219–7016 which were published at 56 FR 15162 on April 15, 1991 are adopted as final rules without change.

225.000–70, 225.000–71, 225.105–70, 225.109, 225.401, 225.402, 225.407, 252.225–7001, 252.225–7005, 252.225–7006 [Amended]

2. The interim rules amending sections 225.000–70, 225.000–71, 225.105–70, 225.109, 225.401, 225.402, 225.407, 252.225–7001, 252.225–7005, and 252.225–7006 which were published at 56 FR 9082 on March 4, 1991 are adopted as final rules without change.

225.603–70, 252.225–7008, 252.225–7014 [Amended]

3. The interim rules amending sections 225.603–70, 252.225–7008, and 252.225–7014 which were published at 56 FR 9082 on March 4, 1991 are adopted as final rules without change.

233.104 [Amended]

4. The interim rule amending section 233.104 which was published at 56 FR 45832 on September 6, 1991 and amended at 56 FR 49506 on September 30, 1991 is adopted as a final rule without further change.

Amendments to DoD FAR Supplement

Therefore, the DoD FAR Supplement is amended as set forth below.

5. The authority for 48 CFR parts 209, 219, 223, 225, 226, 232, 233, 235, 243, 247, 249, 250, and 252 continues to read as follows:

Authority: 5 U.S.C. 301, 10 U.S.C. 2202, DoD Directive 5000.35, and FAR subpart 1.3.

PART 209—CONTRACTOR QUALIFICATIONS

209.470 [Amended]

6. Section 209.470 is amended by revising paragraph (b) to read as follows:

209.470 Authorized representatives.

* * * * *

(b) In the Navy, the General Counsel of the Department of the Navy;

* * * * *

PART 219—SMALL BUSINESS AND SMALL DISADVANTAGED BUSINESS CONCERNS

219.705–2 [Amended]

7. Section 219.705–2 is revised to read as follows:

(d) For research and development acquisitions, major systems acquisitions, and other complex or sensitive acquisitions involving formal or alternative source selection procedures, the extent to which offerors specifically identify, and commit to, SDB, HBCU or MI participation in performance of the contract (whether as joint venture, teaming arrangement, or traditional subcontracting arrangement) shall be an evaluation factor for source selection.

PART 223—ENVIRONMENT, CONSERVATION, OCCUPATIONAL SAFETY, AND DRUG-FREE WORKPLACE

223.7202 [Amended]

8. Section 223.7202 is amended by revising paragraph (b) and paragraph (e) to read as follows:

* * * * *

(a) * * *

(b) To accomplish this objective, it is necessary to obtain certain information relative to the hazards which may be introduced into the workplace by the supplies being acquired. Accordingly, offerors and contractors are required to submit information on hazardous materials under the clause at 252.223–7004, Hazardous Material Identification and Material Safety Data, and under the provisions at 252.223–7006, Pre-Award Submission of Hazardous Material Labels. The latest version of Federal Standard No. 313 (Material Safety Data Sheet, Preparation and Submission of) includes criteria for identification of hazardous materials.

* * * * *

(e) The contracting officer shall provide a copy of MSDSs and hazard warning labels received from apparently successful offerors to the cognizant safety officer and/or other designated official, in order to facilitate:

(1) Inclusion of relevant data in an agency MSDS information system or label information system, if applicable; and

(2) Other control, safety, or information purposes, as applicable.

223.7203 [Amended]

9. Section 223.7203 is revised to read as follows:

223.7203 Solicitation provision and contract clauses.

When one or more of the circumstances listed in 223.7202(c) exists, the contracting officer shall insert—

(a) The provision at 252.223–7006, Pre-Award Submission of Hazardous Material Labels, in the solicitation; and

(b) The clauses at 252.223–7004, Hazardous Material Identification and Material Safety Data, and at 252.223–7007, Hazard Warning Labels, in solicitations and contracts.

10. Subpart 223.75 is revised to read as follows:

Subpart 223.75—Drug-Free Work Force

Sec.

223.7500 Policy.
223.7501 Definitions.
223.7502 Contract clause.

223.7500 Policy.

The unlawful use by contractor employees of controlled substances threatens national security and the safety of personnel and equipment. Therefore, DoD policy is to ensure that DoD contractors have a program for eliminating the unlawful use of controlled substances by employees whose duties affect health, safety, national security, or accomplishment of the DoD mission.

223.7501 Definitions.

As used in this section—

Controlled substance and *employee* are as defined in FAR 23.503.

Employee in a sensitive position is as defined in the clause at 252.223–7500, Drug-Free Work Force.

223.7502 Contract clause.

(a) Use the clause at 252.223–7500, Drug-Free Work Force, in all solicitations and contracts that require contractor employees to perform in sensitive positions.

(b) Do not use the clause in solicitations and contracts—

(1) Below the small purchase limitation in FAR part 13;

(2) For performance or partial performance (but only to the extent of the partial performance) outside the United States, its territories, and its possessions, unless the contracting officer determines inclusion to be in the best interest of the Government; or

(3) For law enforcement agencies, and the head of such agency or designee determines that application of the requirements of this section would be detrimental to the law enforcement agency's undercover operations.

PART 226—OTHER SOCIOECONOMIC PROGRAMS

226.7001 [Amended]

11. Section 226.7001 is revised to read as follows:

226.7001 Scope of Subpart.

This subpart implements certain provisions of section 1207 of Public Law 99–661, section 806 of Public Law 100–180, section 831 of Public Law 101–189, and section 832 of Public Law 101–510 which establish for DoD an objective of awarding a combined total of five percent of its total contract dollars during each of fiscal years 1987–93 to Historically Black Colleges and Universities (HBCUs), Minority Institutions (MIs), and to Small Disadvantaged Business (SDB) Concerns (see 219.201). Section 1207 also provided certain discretionary authority to the Secretary of Defense for achievement of that objective.

226.7003 [Amended]

12. Section 226.7003 is revised to read as follows:

226.7003 General Policy.

In furtherance of the Government policy of placing a fair proportion of its acquisitions with HBCUs, MIs and SDBs, Section 1207 of Public Law 99–661, Section 806 of Public Law 100–180, section 831 of Public Law 101–189, and section 832 of Public Law 101–510 established an objective for the Department of Defense of awarding a combined total of five percent of its total contract dollars during each of fiscal years 1987–93 to HBCUs, MIs and SDBs (see 219.201) and of maximizing the number of such entities participating in Defense prime contracts and subcontracts. Executive Order 12320 contains additional guidance concerning HBCUs. It is the policy of the Department of Defense to strive to meet these objectives through the enhanced use of outreach efforts, technical assistance programs, and the special authorities conveyed by these laws (e.g., through a total set-aside for HBCUs and MIs) to acquire research and studies normally acquired from Higher Education Institutions (HEIs). In addition, DoD will establish "infrastructure assistance" (e.g., scholarships, faculty development, training agreements with defense laboratories, and laboratory renovation) at colleges, universities, and institutions that agree to bear a substantial portion of the costs associated with the programs. (For reporting requirements see 219.202–5.) With regard to technical assistance programs, it is the Department's policy to provide HBCUs and MIs technical assistance, to include information about the Department's HBCU and MI Program, advice about acquisition procedures, instructions on preparation of proposals, and such other assistance as is consistent with the Department's mission. In the event an HBCU or MI submits an offer under an unrestricted acquisition that offers an evaluation preference for SDBs, the HBCU or MI offer shall be evaluated as if it had been submitted by an SDB concern (see 252.219–7007(d)).

226.71 [Removed]

13. Subpart 226.71 is removed.

PART 232—CONTRACT FINANCING

14. Section 232.903 is added to read as follows:

232.903 Policy.

DoD policy is to assist small disadvantaged business concerns by paying such concerns as quickly as possible after invoices are received and prior to normal payment due dates established in the contract (see 232.905–70).

15. Section 232.905–70 is added to read as follows:

232.905–70 Additional Invoice Payment Procedures.

Designated payment offices are encouraged to pay small disadvantaged business (SDB) concerns as quickly as possible after invoices are received and prior to normal payment due dates established in the contract (see 232.903). The restrictions of FAR 32.903 prohibiting early payment do not apply to invoice payments made to SDBs. Contractors shall not, however, be entitled to interest penalties if invoice payments are not made prior to the normal payment due dates established in the contract.

PART 235—RESEARCH AND DEVELOPMENT CONTRACTING

235.006 [Amended]

16. Section 235.006 is revised to read as follows:

235.006 Contracting Methods and Contract Type.

(S–70) *Fixed-Price Type Development Contracts.*

(1) A fixed-price type contract shall not be awarded for a development program effort unless:

(i) The level of program risk permits realistic pricing;

(ii) The use of a fixed-price type contract permits an equitable and sensible allocation of program risk between the Government and the contractor; and

(iii) A written determination, that the criteria of paragraphs (S–70)(1) (i) and (ii) of this section have been met, is properly executed—

(A) By the Under Secretary of Defense for Acquisition (USD(A)), for—

(*1*) Research and development for non-major systems, if the contract is over $25 million;

(*2*) The lead ship of a class;

(*3*) The development of a major system (as defined in FAR 34.001) or subsystem thereof, if the contract is over $25 million, or is over $10 million and is funded with FY 90 funds (Pub. L. 101–165, section 9048)) or FY 91 funds (Pub. L. 101–511).

(B) By the contracting officer for all fixed-price type contracts for all development not covered by paragraph (S–70)(1)(iii)(A) of this section.

(2) Before award, submit the Government's prenegotiation position, and the proposed (and unexecuted) agreement with the contractor to the USD(A) for any action which is—

(i) An increase of more than $250 million in the price of a fixed-price type development contract, or a fixed-price type contract for the lead ship of a class;

(ii) A reduction in the amount of work under a fixed-price type development contract or a fixed-price type contract for the lead ship of a class, when the contract action is valued at more than $100 million;

(iii) A repricing of fixed-price type production options to a development contract, or a contract for the lead ship of a class, which increases the price by more than $250 million for equivalent quantities.

(3) Notify the USD(A) of an intent not to exercise a fixed-price production option on a development contract for a major weapon system reasonably in advance of the expiration of the option exercise period.

PART 243—CONTRACT MODIFICATIONS

17. Section 243.107 is revised to read as follows:

243.107 Contract Clause.

(S–70) The Secretary of Defense is required to notify the Secretary of Labor if the modification or termination for convenience of a major defense contract or subcontract will have a substantial impact on employment. See 249.7003(c) for the prescribed contract clause, which defines "substantial impact on employment."

PART 247—TRANSPORTATION

247.271–4 [Amended]

18. Section 247.271–4 is amended by revising paragraph (b)(9) to read "252.247–7110, Contractor Liability for Loss or Damage."

PART 249—TERMINATION OF CONTRACTS

249.102 [Amended]

19. Section 249.102 is revised to read as follows:

249.102 Notice of Termination.

(a) *General.* See 243.301 for use of the Standard Form 30 (SF 30), Amendment of Solicitation/Modification of Contract, in providing notice of termination and amendment of the termination notice.

(5) Include a statement that, if a termination for convenience will have a substantial impact on employment, as defined in the clause at 252.249–7001, Notification of Substantial Impact on Employment, the contractor must provide the required notice to the contracting officer within 30 calendar days.

20. Subpart 249.70 is amended by revising 249.7003 to read as follows:

249.7003 Contract Modifications and Terminations For Convenience Having a Substantial Impact on Employment.

(a) Section 4201(a)(1)(B) of the National Defense Authorization Act for Fiscal Year 1991 (Pub. L. 101–510, Division D, Title XLII: Defense Economic Adjustment, Diversification, Conversion, and Stabilization Act of 1990), requires the Secretary of Defense to notify the Secretary of Labor if a modification or termination for convenience of a major defense contract or subcontract will have a substantial impact on employment, as defined in the clause at 252.249–7001, Notification of Substantial Impact on Employment.

(b) Within ten work days after the contractor provides the notification required under the clause at 252.249–7001, the head of the contracting activity shall notify the Office of Economic Adjustment (OEA), Assistant Secretary of Defense (Force Management and Personnel), in accordance with department/agency procedures.

(1) The notice to OEA shall include the data elements set forth in 252.249–7001(c).

(2) Notices may be mailed or telefaxed to OEA at: Office of Economic Adjustment, 400 Army-Navy Drive, Suite 200, Arlington, VA 22202–2884, Attention: Division D Notification. Telefax: (703) 697–3021.

(c) Use the clause at 252.249–7001, Notification of Substantial Impact on Employment, in all contracts of $5 million or more and all contracts with subcontracts of $500,000 or more.

PART 250—EXTRAORDINARY CONTRACTUAL ACTIONS

250.103 [Removed]

21. Section 250.103 is removed.

PART 252—SOLICITATION PROVISIONS AND CONTRACT CLAUSES

22. Sections 252.223–7006 and 252.223–7007 are added to read as follows:

252.223–7006 Pre-Award Submission of Hazardous Material Labels.

As prescribed in 223.7203, insert the following provision:

Pre-Award Submission of Hazardous Material Labels (Nov. 1991)

(a) *Hazardous material*, as used in this provision, includes any material defined as hazardous under the version of Federal Standard 313, current at the time of submission of this offer.

(b) All hazardous material, to be delivered, or otherwise furnished under the resultant contract, requires labeling in accordance with either the Hazard Communication Standard (29 CFR 1910.1200 et seq.) or one of the statutes in paragraph (b) (1) through (5) of the Hazard Warning Labels clause of this solicitation.

(1) *Hazardous material not subject to Hazard Communication Standard labeling.* The offeror shall identify in the following spaces the hazardous material, to be delivered or otherwise furnished under the resultant contract, that requires labeling in accordance with one of the statutes in paragraphs (b)(1) through (5) of the Hazard Warning Labels clause of this solicitation. Use additional sheets, if necessary, and title them "Identification of Hazardous Material Not Subject to the Hazard Communication Standard—Continuation Sheet."

Material (Enter "NONE" if none exists)	Statute

(2) *Hazardous material subject to Hazard Communication Standard labeling.* The apparent successful offeror shall submit before award of the contract a copy of the hazard warning label for any hazardous material which is proposed to be delivered, or otherwise furnished, under any resultant contract and which is subject to the labeling requirements of the Hazard Communication Standard (29 CFR 1910.1200 et seq.). The offeror shall submit the labels with the material data sheets being furnished under the Hazardous Material Identification and Material Safety Data clause of this solicitation.

(End of provision)

252.223-7007 Hazard Warning Labels.

As prescribed in 223.7203, insert the following clause:

Hazard Warning Labels (Nov 1991)

Hazardous material, as used in this clause, includes any material defined as hazardous under the latest version of Federal Standard 313 (including revisions adopted during the term of this contract).

(b) The Contractor shall label the individual item package (unit container) of any hazardous material to be delivered under this contract. The labeling shall conform to the requirements of the Hazard Communication Standard, unless the hazardous material is otherwise subject to the labeling requirements of one of the following statutes, in which case, the labeling shall conform to the statute:

(1) Federal Insecticide, Fungicide and Rodenticide Act;

(2) Federal Food, Drug and Cosmetics Act;

(3) Consumer Product Safety Act;

(4) Federal Hazardous Substances Act;

(5) Federal Alcohol Administration Act.

(c) The Contractor shall also comply with MIL-STD-129, Marking for Shipment and Storage (including revisions adopted during the term of this contract).

(End of clause)

23. Section 252.223-7500 is revised to read as follows:

252.223-7500 Drug-Free Work Force.

As prescribed in 223.7502, insert the following clause:

Drug-Free Work Force (Nov 1991)

(a) Definitions.

As used in this clause—

(1) *Controlled substance*, "employee," and "criminal drug statute" have the meanings given in the Drug-Free Workplace clause of this contract.

(2) *Employee in a sensitive position* means an employee whose duties could reasonably be expected to affect health, safety, or national security, including, but not limited to, duties involving—

(i) Access to classified information;

(ii) Possession or use of firearms;

(iii) Design, manufacture, test and evaluation, or maintenance of aircraft, vessels, vehicles, heavy equipment, munitions, toxic materials, weapons, weapons systems, potentially dangerous equipment/materials/or applications (such as lasers, explosives, unstable chemicals, or medical equipment with potentially life threatening consequences), or major components of the foregoing which are directly contracted for by the Department of Defense;

(iv) Control, operation or use of aircraft, vessels, vehicles, heavy equipment, toxic or nuclear materials, munitions, weapons, weapon systems, or potentially dangerous equipment/materials/or applications (such as lasers, explosives, unstable chemicals, or medical equipment with potentially life threatening consequences);

(v) Transportation, storage, or protection of toxic or nuclear materials, or munitions, or potentially dangerous materials (such as explosives or unstable chemicals);

(vi) Direct treatment or rehabilitation of employees for unlawful use or abuse of controlled substances; or

(vii) Air traffic control.

(b) The Contractor shall institute and maintain a program for achieving a drug-free work force. As a minimum, the program shall provide for the random drug testing of Contractor employees working in sensitive positions. The Contractor's drug testing program shall conform to the "Mandatory Guidelines for Federal Workplace Drug Testing Programs" published by the Department of Health and Human Services (53 FR 11970), April 11, 1988.

(c) The Contractor shall not permit an employee to work in a sensitive position in the performance of a Department of Defense contract if—

(1) The employee tests positive for the use of a controlled substance during a test pursuant to this clause or a test based on reasonable suspicion of drug use; and

(2) The use is determined to be unlawful; or

(3) The employee is convicted of violating a criminal drug statute.

(d) The Contractor may permit an employee covered by paragraph (c) of this clause to work in a sensitive position on a Department of Defense contract only—

(1) With the approval of the Contracting Officer; and

(2) After the employee has successfully completed a supervised rehabilitation program.

(e) The requirements of this clause take precedence over any State and local laws to the contrary.

(End of clause)

252.226-7002 [Removed]

24. Section 252.226-7002 is removed.

252.247-7110 [Amended]

25. Section 252.247-7110 is revised to read as follows:

252.247-7110 Contractor Liability for Loss or Damage.

As prescribed in 247.271-4(b)(9), use the following clause:

Contractor Liability for Loss or Damage (Nov 1991)

(a) *Definitions.* As used in this clause—

Article means any shipping piece or package and its contents.

Schedule means the level of service for which specific types of traffic apply as described in DoD 4500.34-R, Personal Property Traffic Management Regulation.

(b) For shipments picked up under Schedule I, Outbound Services, or delivered under Schedule II, Inbound Services—

(1) If notified within one year after delivery that the owner has discovered loss or damage to the owner's property, the Contractor agrees to indemnify the Government for loss or damage to the property which arises from any cause while it is in the Contractor's possession. The Contractor's liability is—

(i) *Non-negligent damage.* For any cause, other than the Contractor's negligence, indemnification shall be at a rate not to exceed sixty cents per pound per article.

(ii) *Negligent damage.* When loss or damage is caused by the negligence of the Contractor, the liability is for the full cost of satisfactory repair or for the current replacement value of the article.

(2) The Contractor shall make prompt payment to the owner of the property for any loss or damage for which the Contractor is liable.

(3) In the absence of evidence or supporting documentation which places liability on a carrier or another contractor, the destination contractor shall be presumed to be liable for the loss or damage, if timely notified.

(c) For shipments picked up or delivered under Schedule III, Intra-City and Intra-Area—

(1) If notified of loss or damage within 75 days following delivery, the Contractor agrees to indemnify the Government for loss or damage to the owner's property.

(2) The Contractor's liability shall be for the full cost of satisfactory repair, or for the

current replacement value of the article less depreciation, up to a maximum liability of $1.25 per pound times the net weight of the shipment.

(3) The Contractor has full salvage rights to damaged items which are not repairable and for which the Government has received compensation at replacement value.

(End of clause)

26. Section 252.249–7001 is revised to read as follows:

252.249–7001 Notification of Substantial Impact on Employment.

As prescribed in 249.7003(c), use the following clause:

Notification of Substantial Impact on Employment (Nov. 1991)

(a) *Definitions.*

(1) "Major defense contract or subcontract" means—

(i) All prime contracts of $5 million or more; and

(ii) All subcontracts of $500,000 or more.

(2) "Substantial impact on employment" means—

(i) A reduction of—

(A) 2,500 or more employee positions, in the case of a Metropolitan Statistical Area (MSA) or similar area. MSAs are identified in FIPS Publication 8–5, Metropolitan Statistical Areas, which is available from the U.S. Department of Commerce, National Technical Information Service, Springfield, VA 22161, Tel. (703) 487–4650. Telephone inquiries concerning MSAs may also be directed to the Bureau of the Census, Population Division, Population Distribution Branch, Washington, DC, Tel. (301) 763–5158;

(B) 1,000 or more employee positions, in the case of a labor market area outside an MSA, or

(C) One percent of the total number of civilian jobs in that area; or

(ii) A reduction, or the threat of a reduction, of—

(A) 25 percent or more in sales or production of the contractor or subcontractor; or

(B) 80 percent or more of the workforce of the contractor or subcontractor in any division of such contractor or such subcontractor or at any plant or other facility of such contractor or subcontractor; or

(iii) Any group of 100 or more workers at a defense facility who are, or who are threatened to become, eligible to participate in the Defense Conversion Adjustment Program under section 325 of the Job Training Partnership Act (29 U.S.C. 1662–1662c, as amended).

(b) This clause applies only if a modification or termination for convenience of a major defense contract or subcontract will have a substantial impact on employment.

(c) The Contractor shall notify the Contracting Officer within 30 calendar days if the proposed modification or termination for convenience of this contract or a major defense subcontract under this contract will have a substantial impact on employment. The Contractor may use DD Form 2604, Notification of Substantial Impact. If the form is not used, the notice shall include:

(1) Contract number;

(2) Contractor name and division name;

(3) Type of business (e.g. small disadvantaged business, small business, large business, etc.);

(4) Address of affected work location, including county;

(5) Contract price of items cancelled or terminated;

(6) Number of employees affected;

(7) Percentage reduction in sales or production;

(8) Percentage of contractor workforce at affected work location;

(9) Title and signature of the reporting official; and

(10) The information required by (1) through (9) for each subcontract.

(d) The Contractor shall include the substance of this clause in all subcontracts of $500,000 or more under this contract.

(End of Clause)

BILLING CODE 3810–01–M

Proposed Rules

Federal Register
Vol. 56, No. 229
Wednesday, November 27, 1991

This section of the FEDERAL REGISTER contains notices to the public of the proposed issuance of rules and regulations. The purpose of these notices is to give interested persons an opportunity to participate in the rule making prior to the adoption of the final rules.

OFFICE OF PERSONNEL MANAGEMENT

5 CFR Part 630

RIN 3206-AE53

Absence and Leave; Voluntary Leave Transfer and Voluntary Leave Bank Programs

AGENCY: Office of Personnel Management.

ACTION: Proposed rule.

SUMMARY: The Office of Personnel Management (OPM) proposes to amend its regulations on the use of annual leave by leave recipients under the voluntary leave transfer or leave bank programs. The proposed regulations would provide that donated annual leave used by a leave recipient under the voluntary leave transfer program or annual leave received from a leave bank under the voluntary leave bank program may be used only for the purpose of the medical emergency for which the leave recipient was approved. In addition, the proposed regulations would permit an employee's leave bank membership to transfer to another leave bank within the same agency. This would eliminate the need for employees who transfer within their employing agency to make an additional contribution to a leave bank for the year in which the transfer occurs.

DATES: Comments must be submitted on or before December 27, 1991.

ADDRESSES: Comments may be sent or delivered to Barbara L. Fiss, Assistant Director for Pay Policy and Programs, Personnel Systems and Oversight Group, U.S. Office of Personnel Management, room 7H28, 1900 E Street, NW., Washington, DC 20415.

FOR FURTHER INFORMATION CONTACT: Martha Hoehn, (202) 606-2858 or (FTS) 266-2858.

SUPPLEMENTARY INFORMATION: Public Law 100-566, the "Federal Employees Leave Sharing Act of 1988," directed OPM to establish by regulation a 5-year experimental voluntary leave transfer and leave bank program. OPM published final regulations governing these programs in the **Federal Register** on December 28, 1989 (54 FR 53303). As part of OPM's responsibility to monitor and evaluate the operation of the voluntary leave transfer and leave bank programs, we have determined that certain technical changes are necessary. These changes are based on agency comments received during the preparation of a report to Congress on first-year operation of the programs.

OPM proposes to revise 5 CFR 630.909(a) and 630.1009(a) to provide that annual leave used by leave recipients under the voluntary leave transfer program and annual leave received by leave recipients under the voluntary leave bank program may be used only for the purpose of the medical emergency for which the leave recipient was approved. This proposed change will help agencies administer their programs and prevent abuse of the program.

Also, in response to a request from the Internal Revenue Service, OPM proposes to revise 5 CFR 630.1004(h) by giving a leave bank board the authority to eliminate the minimum contribution required to become a leave bank member if a leave bank member transfers within his or her employing agency to an organization covered by a different leave bank. The proposed change would permit an employee to "transfer" his or her leave bank membership to a different leave bank within the same agency and eliminate the necessity for the employee to make an additional minimum contribution to a leave bank during the same year. This change will help agencies, such as the Internal Revenue Service, that established several leave banks within the agency and that experience significant employee mobility within the agency.

E.O. 12291, Federal Regulation

I have determined that this is not a major rule as defined under section 1(b) of E.O. 12291, Federal Regulation.

Regulatory Flexibility Act

I certify that these regulations will not have a significant economic impact on a substantial number of small entities because they will affect only Federal employees and agencies.

List of Subjects in 5 CFR Part 630

Government employees.

U.S. Office of Personnel Management.
Constance Berry Newman,
Director.

Accordingly, OPM proposes to amend part 630 of title 5 of the Code of Federal Regulations as follows:

PART 630—ABSENCE AND LEAVE

1. The authority citation for part 630 continues to read as follows:

Authority: 5 U.S.C. 6311; § 630.303 also issued under 5 U.S.C. 6133(a); § 630.501 and subpart F also issued under E.O. 11228; subpart G also issued under 5 U.S.C. 6305; subpart H issued under 5 U.S.C. 6326; subpart I also issued under 5 U.S.C. 6332 and Public Law 100-566; subpart J also issued under 5 U.S.C. 6362 and Public Law 100-566; subpart K also issued under Public Law 102-25.

2. Section 630.909(a) is revised to read as follows:

§ 630.909 Use of transferred annual leave.

(a) A leave recipient may use annual leave transferred to his or her annual leave account under § 630.906 of this part only for the purpose of the medical emergency for which the leave recipient was approved.

* * * * *

3. Section 630.1004(h)(3) is added to read as follows:

§ 630.1004 Application to become a leave contributor and leave bank member.

* * * * *

(h) * * *

(3) Eliminate the requirement for a minimum contribution under paragraph (g) of this section when a leave bank member transfers within his or her employing agency to an organization covered by a different leave bank.

* * * * *

4. Section 630.1009(a) is revised to read as follows:

§ 630.1009 Use of annual leave withdrawn from a leave bank.

(a) A leave recipient may use annual leave withdrawn from a leave bank only for the purpose of the medical emergency for which the leave recipient was approved.

BILLING CODE 6325-01-M

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

[Docket No. 91-CE-71-AD]

14 CFR Part 39

Airworthiness Directives; Piper PA34 Series Airplanes

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Notice of proposed rulemaking (NPRM).

SUMMARY: This notice proposes to adopt a new airworthiness directive (AD) that would supersede AD 90-17-04, which currently requires the replacement of the rudder torque tube fitting and attaching hardware on Piper PA34 series airplanes. Parts are currently not available to accomplish the modification required by AD 90-17-04. The proposed action would allow continued operation of the affected airplanes until parts become available provided repetitive inspections are performed. The actions specified by the proposed AD are intended to prevent failure of the torque tube fitting and possible loss of rudder control while also preventing inadvertent grounding of the affected airplanes.

DATES: Comments must be received on or before January 31, 1992.

ADDRESSES: Piper Service Bulletin No. 899, dated February 10, 1989, that is discussed in this AD may be obtained from the Piper Aircraft Corporation, Customer Services, 2926 Piper Drive, Vero Beach, Florida 32960. This information also may be examined at the Rules Docket at the address below. Send comments on the proposal in triplicate to the FAA, Central Region, Office of the Assistant Chief Counsel, Attention: Rules Docket No. 91-CE-71-AD, room 1558, 601 E. 12th Street, Kansas City, Missouri 64106. Comments may be inspected at this location between 8 a.m. and 4 p.m., Monday through Friday, holidays excepted.

FOR FURTHER INFORMATION CONTACT: Mr. David Cundy, Aerospace Engineer, FAA, Atlanta Aircraft Certification Office, 1669 Phoenix Parkway, suite 210C, Atlanta, Georgia 30349; Telephone (404) 991-2910; Facsimile (404) 991-3606.

SUPPLEMENTARY INFORMATION:

Comments Invited

Interested persons are invited to participate in the making of the proposed rule by submitting such written data, views, or arguments as they may desire. Communications should identify the regulatory docket number and be submitted in triplicate to the address specified above. All communications received on or before the closing date for comments, specified above, will be considered before taking action on the proposed rule. The proposals contained in this notice may be changed in light of the comments received.

Comments are specifically invited on the overall regulatory, economic, environmental, and energy aspects of the proposed rule. All comments submitted will be available, both before and after the closing date for comments, in the Rules Docket for examination by interested persons. A report that summarizes each FAA-public contact concerned with the substance of this proposal will be filed in the Rules Docket.

Availability of NPRMs

Any person may obtain a copy of this NPRM by submitting a request to the FAA, Central Region, Office of the Assistant Chief Counsel, Attention: Rules Docket No. 91-CE-71-AD, room 1558, 601 E. 12th Street, Kansas City, Missouri 64106.

Discussion

Airworthiness Directive (AD) 90-17-04, Amendment 39-6674 (55 FR 3238 August 9, 1990) currently requires a one-time inspection of any steel rudder torque tube fitting for proper attachment and the replacement of any aluminum rudder torque tube fitting with one made of steel on Piper Models PA34-200, PA34-200T, and PA34-220T airplanes. The inspection or replacement must be done in accordance with Piper Service Bulletin No. 899, dated February 10, 1989.

It has been reported to the FAA that parts are presently not available to perform the replacement that is required by AD 90-17-04, Amendment 39-6674. The FAA has determined that the requirements of AD 90-17-04 are still valid but, to avoid inadvertent grounding of the affected airplanes, the airplane operators should be allowed to continue operating the affected airplanes provided (1) The parts have been ordered from the manufacturer; (2) repetitive inspections of the aluminum rudder torque tube fitting are performed; and (3) cracked or corroded aluminum rudder torque tube fittings are replaced.

Since the condition described is likely to exist or develop in other Piper Models PA34-200, PA34-200T, and PA34-220T airplanes of the same type design, the proposed AD would require a one-time inspection of any steel rudder torque tube fitting and the replacement of any aluminum rudder torque tube fitting with one made of steel in accordance with Piper Service Bulletin No. 899, dated February 10, 1989; or continued operation of the airplane if parts are not available provided (1) The airplane operator has ordered the parts from the manufacturer; (2) the airplane operator performs repetitive inspections of the aluminum rudder torque tube fitting; and (3) cracked or corroded aluminum rudder torque fittings are replaced.

It is estimated that 2,500 airplanes in the U.S. registry would be affected by the proposed AD, that it would take approximately 4 hours per airplane to accomplish the proposed action, and that the average labor rate is approximately $55 an hour. Parts cost approximately $150 per airplane. Based on these figures, the total cost impact of the proposed AD on U.S. operators is estimated to be $925,000. The above cost analysis is the same as AD 90-17-04, which would be superseded by this proposed action. This proposed action would provide an alternative method that would avoid the impact associated with removing the affected airplanes from service if replacement parts were not immediately available.

The regulations proposed herein would not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. Therefore, in accordance with Executive Order 12612, it is determined that this proposal would not have sufficient federalism implications to warrant the preparation of a Federalism Assessment.

For the reasons discussed above, I certify that this action (1) Is not a "major rule" under Executive Order 12291; (2) is not a "significant rule" under DOT Regulatory Policies and Procedures (44 FR 11034, February 26, 1979); and (3) if promulgated, will not have a significant economic impact, positive or negative, on a substantial number of small entities under the criteria of the Regulatory Flexibility Act. A copy of the draft regulatory evaluation prepared for this action has been placed in the Rules Docket. A copy of it may be obtained by contacting the Rules Docket at the location provided under the caption "ADDRESSES".

List of Subjects in 14 CFR Part 39

Air transportation, Aircraft, Aviation safety, Safety.

Accordingly, pursuant to the authority delegated to me by the Administrator, the Federal Aviation Administration proposes to amend 14 CFR part 39 of the Federal Aviation Regulations as follows:

PART 39—[Amended]

1. The authority citation for Part 39 continues to read as follows:

Authority: 49 U.S.C. 1354(a), 1421 and 1423; 49 U.S.C. 106(g); and 14 CFR 11.89.

§ 39.13 [Amended]

2. Section 39.13 is amended by removing AD 90–17–04, Amendment 39–6674 (55 FR 3238 August 9, 1990), and adding the following new AD:

Piper Aircraft Corporation: docket No. 91–CE–71–AD. Applicability: Model PA34–200 airplanes (serial numbers (S/N) 34–7250001 through 34–7450220), Model PA34–200T airplanes (S/N 34–7570001 through 34–8170092), and Model PA34–220T airplanes (S/N 34–8133001 through 34–8533012), certificated in any category.

Compliance: Required as indicated, unless already accomplished.

To prevent failure of the torque tube fitting and possible loss of rudder control, accomplish the following:

(a) Within the next 50 hours time-in-service (TIS) after September 14, 1990 (the effective date of AD 90–17–04, Amendment 39–6674), inspect to determine whether the rudder torque tube fitting is steel or aluminum.

(1) If steel, inspect for proper attachment, and check the bolt torque in accordance with the criteria and instructions in Piper Service Bulletin No. 899, dated February 10, 1989.

(i) If fitting is properly attached and bolt torque is correct, return the airplane to service and the requirements of this AD have been accomplished.

(ii) If fitting is improperly attached and/or bolt torque is incorrect, properly attach fitting and/or torque to proper criteria as specified in and in accordance with the instructions in Piper SB No. 899, dated February 10, 1939. Return the airplane to service and the requirements of this AD have been accomplished.

(2) If aluminum, replace with steel fitting in accordance with the instructions in Piper SB No. 899, dated February 10, 1989, return the airplane to service, and the requirements of this AD have been accomplished.

(b) If the steel fitting required by paragraph (a)(2) of this AD has been ordered but is not available, prior to further flight, accomplish the following:

(1) Visually inspect the aluminum fitting for corrosion. If any evidence of corrosion is found, remove and treat the corroded area in accordance with AC 43–13.1A.

(2) Dye penetrant inspect the aluminum fitting for cracks. If found cracked, replace with an aluminum fitting found to be free from cracks and corrosion.

(3) Return the airplane to service and visually inspect the aluminum fitting for proper attachment, cracks, and/or corrosion, at intervals not to exceed 50 hours TIS.

(i) If fitting is found improperly attached or hardware is found loose, properly attach fitting in accordance with the instructions in Piper SB No. 899, dated February 10, 1989.

(ii) If any evidence of corrosion is found, remove and treat the corroded area in accordance with AC 43–13.1A.

(iii) If found cracked, replace with aluminum fitting found to be free from cracks and corrosion in accordance with the installation instructions in Piper SB No. 899, dated February 10, 1989.

(c) Special flight permits may be issued in accordance with FAR 21.197 and 21.199 to operate the airplane to a location where the requirements of this AD can be accomplished.

(d) An alternative method of compliance or adjustment of the initial or repetitive compliance times that provides an equivalent level of safety may be approved by the Manager, Atlanta Aircraft Certification Office, 1669 Phoenix Parkway, suite 210C, Atlanta, Georgia 30349. The request should be forwarded through an appropriate FAA Maintenance Inspector, who may add comments and then send it to the Manager, Atlanta Aircraft Certification Office.

(e) All persons affected by this directive may obtain copies of the document referred to herein upon request to the Piper Aircraft Corporation, Customer Services, 2926 Piper Drive, Vero Beach, Florida 32960; or may examine this document at the FAA, Central Region, Office of the Assistant Chief Counsel, Room 1558, 601 E. 12th Street, Kansas City, Missouri 64106.

This amendment supersedes AD 90–17–04, Amendment 39–6674.

Issued in Kansas City, Missouri, on November 21, 1991.

John E. Tigue,

Acting Manager, Small Airplane Directorate Aircraft Certification Service.

RIN 1545–AM12

Calculation of Currency Gain or Loss on Transfers From Qualified Business Unit Branches Using the Profit and Loss Method of Accounting; Correction

AGENCY: Internal Revenue Service, Treasury.

ACTION: Correction to notice of proposed rulemaking.

SUMMARY: This document contains corrections to the notice of proposed rulemaking (INTL–965–86), which was published on Wednesday, September 25, 1991, (56 FR 48457). The proposed Income Tax Regulations relate to the calculation of income (including currency gain or loss on remittances) attributable to a qualified business unit (QBU) of a taxpayer that uses the profit and loss method of accounting.

FOR FURTHER INFORMATION CONTACT: Carol Murphy (202–566–6795, not a toll-free call).

SUPPLEMENTARY INFORMATION:

Background

The notice of proposed rulemaking that is the subject of these corrections contains proposed regulations under section 987 of the Internal Revenue Code of 1986 (including currency gain or loss on remittances and terminations) attributable to a QBU branch of a taxpayer that uses profit and loss method of accounting.

Need for Correction

As published, the proposed regulations contain errors which may prove to be misleading and are in need of clarification.

Correction of Publication

Accordingly, the publication of the proposed regulations (INTL–965—86), which was the subject of FR Doc. 91–22854, is corrected as follows:

§ 1.987–3 [Corrected]

Par. 1. On page 48464, column one, in § 1.987–3, paragraph (h)(1), line 9, the language "includes any exchange or loss" is corrected to read "includes any exchange gain or loss".

Par. 2. On page 48464, column three, in § 1.987–7(j), paragraph (iii) of *Example 2*, is corrected to read as follows:

§ 1.987–3 Termination of a QBU branch.

* * * * *

(j) * * *

Example. 2. * * *

(iii) Under Step 3, X is deemed to transfer 4LC to A. This results in an equity pool of 0, and a basis pool of $2 ($1 + $1 (4LC at 4LC:$1)). Therefore, X recognizes section 987 loss of $2, which is the positive amount of the basis pool.

Dale D. Goode,

Federal Register Liasion Officer Assistant Chief Counsel (Corporate).

DEPARTMENT OF THE INTERIOR

Office of Surface Mining Reclamation and Enforcement

30 CFR Part 925

Missouri Permanent Regulatory Program

AGENCY: Office of Surface Mining Reclamation and Enforcement (OSM), Interior.

ACTION: Proposed rule; public comment period and opportunity for public hearing on proposed amendment.

SUMMARY: OSM is announcing receipt of a proposed amendment to the Missouri permanent regulatory program (hereinafter, the "Missouri program") under the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The proposed amendment revises State statutes pertaining to penalties. The amendment was submitted on the State's own initiative and is intended to revise the State program to be consistent with other programs in the Missouri Department of Natural Resources.

This notice sets forth the times and locations that the Missouri program and proposed amendment to that program are available for public inspection, the comment period during which interested persons may submit written comments on the proposed amendment, and procedures that will be followed regarding the public hearing, if one is requested.

DATES: Written comments must be received on or before 4 p.m., c.s.t. December 27, 1991. If requested, a public hearing on the proposed amendments will be held on December 23, 1991. Requests to present oral testimony at the hearing must be received by 4 p.m., c.s.t. on December 12, 1991.

ADDRESSES: Written comments should be mailed or hand delivered to Jerry R. Ennis at the address listed below.

Copies of the Missouri program, the proposed amendment, and all written comments received in response to this notice will be available for public review at the addresses listed below during normal business hours, Monday through Friday, excluding holidays. Each requester may receive one free copy of the proposed amendment by contacting OSM's Kansas City Field Office.

Jerry R. Ennis, Director, Kansas City Field Office, Office of Surface Mining Reclamation and Enforcement, 943 Wyandotte, room 500, Kansas City, MO 64105, Telephone: (816) 374–6405.

Missouri Department of Natural Resources, Land Reclamation Program, 205 Jefferson Street, P.O. Box 176, Jefferson City, MO 65102, Telephone: (314) 751–4041.

FOR FURTHER INFORMATION CONTACT: Jerry R. Ennis, Director, Kansas City Field Office, (816) 374–6405.

SUPPLEMENTARY INFORMATION:

I. Background on the Missouri Program

On November 21, 1980, the Secretary of Interior conditionally approved the Missouri program. General background information on the Missouri program, including the Secretary's findings, the disposition of comments, and the conditions of approval of the Missouri program can be found in the November 21, 1980, **Federal Register** (45 FR 77017). Subsequent actions concerning Missouri's program and program amendments can be found at 30 CFR 925.12, 925.15, and 925.16.

II. Proposed Amendment

By letter dated November 8, 1991, (Administrative Record No. MO–541) Missouri submitted a proposed amendment to its program pursuant to SMCRA. Missouri submitted the proposed amendment at the State's own initiative to improve its program.

Missouri proposes to amend the Revised Statutes of Missouri (MO. Rev. Stat.) at sections: 444.870.1 through 444.870.8, Penalties.

III. Public Comment Procedures

In accordance with the provisions of 30 CFR 732.17(h), OSM is now seeking comment on whether the proposed amendment satisfies the applicable program approval criteria of 30 CFR 732.15. If the amendment is deemed adequate, it will become part of the Missouri program.

Written Comments

Written comments should be specific, pertain only to the issue proposed in this rulemaking, and include explanations in support of the commenter's recommendations. Comments received after the time indicated under "DATES" or at locations other than the Kansas City Field Office will not necessarily be considered in the final rulemaking or included in the administrative record.

Public Hearing

Persons wishing to testify at the public hearing should contact the person listed under **"FOR FURTHER INFORMATION CONTACT"** by 4:00 p.m., c.s.t. December 12, 1991. The location and time of the hearing will be arranged with those persons requesting the hearing. If no one requests an opportunity to testify at a public hearing, the hearing will not be held.

Filing of a written statement at the time of the hearing is requested, as it will greatly assist the transcriber. Submission of written statements in advance of the hearing will allow OSM officials to prepare adequate responses and appropriate questions.

The public hearing will continue on the specified date until all persons scheduled to comment have been heard. Persons in the audience who have not been scheduled to testify, and who wish to do so, will be heard following those who have been scheduled. The hearing will end after all persons scheduled to testify and persons present in the audience who wish to testify have been heard.

Public Meeting

If only one person requests an opportunity to testify at a hearing, a public meeting, rather than a public hearing, may be held. Persons wishing to meet with OSM representatives to discuss the proposed amendment may request a meeting by contacting the person listed under **"FOR FURTHER INFORMATION CONTACT."** All such meetings will be open to the public and, if possible, notices of meetings will be posted at the locations listed under **"ADDRESSES."** A written summary of each meeting will be made a part of the administrative record.

List of Subjects in 30 CFR Part 925

Intergovernmental relations, Surface mining, Underground mining.

Dated: November 20, 1991.

Raymond L. Lowrie,

Assistant Director, Western Support Center.

BILLING CODE 4310–05–M

DEPARTMENT OF VETERANS AFFAIRS

38 CFR Part 21

RIN 2900–AE85

Election of Subsistence Allowance at the Chapter 34 Rate Under the Vocational Rehabilitation Program

AGENCY: Department of Veterans Affairs.

ACTION: Proposed regulatory amendments.

SUMMARY: This proposed change would eliminate provisions under which a service-disabled veteran in the vocational rehabilitation program with remaining eligibility and entitlement to educational assistance benefits could elect payment of chapter 31 subsistence allowance at the chapter 34 educational assistance rate. No veterans are currently eligible to receive educational assistance benefits under chapter 34 since the law barred provision of those benefits after December 31, 1989. Therefore, no one presently qualifies to make the election to receive benefits at chapter 34 rates. The intended effect of this change is to update VA regulations by removing all provisions for election

of subsistence allowance at the chapter 34 rate or payment at that rate.

DATES: Comments must be received on or before December 27, 1991. All comments received will be available for public inspection until January 6, 1992. It is proposed that this change be effective January 1, 1990.

ADDRESSES: Interested persons are invited to submit written comments, suggestions, or objections regarding these changes to the Secretary of Veterans Affairs, 810 Vermont Avenue NW., Washington, DC, 20420. All written comments will be available for public inspection only in the Veterans Services Unit, room 170 of the above address, between the hours of 8 a.m. and 4:30 p.m., Monday through Friday (except holidays) until January 6, 1992.

FOR FURTHER INFORMATION CONTACT: Morris Triestman, (202) 233–6496, Rehabilitation Consultant, Policy and Program Development, Vocational Rehabilitation Service, Veterans Benefits Administration, Department of Veterans Affairs, 810 Vermont Avenue NW., Washington DC 20420.

SUPPLEMENTARY INFORMATION: A veteran with remaining eligibility for the entitlement to educational assistance benefits under the noncontributory educational assistance program authorized under chapter 34, title 38, United States Code, if eligible to receive a subsistence allowance under the chapter 31 vocational rehabilitation program, could formerly elect to receive chapter 31 subsistence payments at the educational assistance rate payable under the chapter 34 program under certain conditions. However, effective December 31, 1989, no further benefits could be afforded any eligible veteran under the chapter 34 program. As a result no one presently has any remaining eligibility for or entitlement to such benefits upon which to base an election to receive chapter 31 benefits at chapter 34 rates. Therefore we are deleting all references to this option from the regulations.

In addition we are making other changes which update the pages being revised to remove references to chapter 34. For example, 38 CFR 21.134 is revised to delete a reference to the applicability of chapter 34 regulations to the pursuit of flight training under chapter 31. This change does not affect VA policy under which vocational rehabilitation participants are only furnished flight training as a part of training which leads to a standard college degree.

These regulatory amendments are retroactively effective. These are interpretive rules which implement statutory provisions. Moreover, VA finds that good cause exists for making these rules retroactively effective. A delayed effective date would be contrary to statutory design and would complicate implementation of this provision of law.

These proposed regulations do not contain a major rule as that term is defined in Executive Order 12291, Federal Regulations. The proposal will not have a $100 million annual effect on the economy, will not cause a major increase in costs or prices, and will not have any other significant adverse effects on the economy. The Secretary certifies that these amendments will not, if promulgated, have a significant economic impact on a substantial number of small entities as they are defined in the Regulatory Flexibility Act (RFA) 5 U.S.C. 601–612. Pursuant to 5 U.S.C. 605(b), these rules are therefore exempt from the initial and final flexibility analyses requirements of sections 603 and 604. The reasons for this certification are that the amendments only affect the rights of individual beneficiaries. No new regulatory burdens are imposed on small entities by these amendments.

(The Catalog of Federal Domestic Assistance number is 64.116.)

List of Subjects in 38 CFR Part 21

Civil rights, Claims, Education, Grant programs, Loan programs, Reporting requirements, Schools, Veterans, Vocational education, Vocational rehabilitation.

Approved: October 25, 1991.

Edward J. Derwinski,

Secretary of Veterans Affairs.

PART 21—VOCATIONAL REHABILITATION AND EDUCATION

For the reasons set forth in the preamble, 38 CFR part 21 is proposed to be amended as follows:

1. The authority citation for part 21, subpart A continues to read as follows:

Authority: 38 U.S.C. 210(C).

1A. Section 21.21 is amended by revising paragraph (a) and its authority citation to read as follows:

§ 21.21 Election of benefits under education programs administered by the Department of Veterans Affairs.

(a) *Election of benefits required.* A veteran must make an election of benefits among the programs of education administered by VA for which he or she may be eligible. A veteran who has basic entitlement to rehabilitation under chapter 31 and is also eligible for assistance under any of the other education programs administered by VA must make an election of benefits between chapter 31 and any other VA program of education for which he or she may be eligible. The veteran may reelect at any time if he or she is otherwise eligible. (See §§ 21.264 and 21.334.)

(Authority: 38 U.S.C. 1781(b))

* * * * *

§ 21.22 [Amended]

2. Section 21.22, paragraph (a) is amended by removing the words "or chapter 34" wherever they appear.

§ 21.78 [Amended]

3. In § 21.78, the first sentence of the introductory text to paragraph (b)(4) is amended by removing the words "or chapter 34" wherever they appear; in paragraph (b)(4)(i) remove the words "under § 21.4235, or" and add "under § 21.4235 before December 31, 1989, or"; in paragraph (b)(4)(ii) remove the words "or 45 month limitation on chapter 34 entitlement".

4. Section 21.134 and its authority citation are revised to read as follows:

§ 21.134 Limitation on flight training.

Flight training approved under chapter 31 may only be authorized in degree curriculums in the field of aviation that include required flight training. This type of training is otherwise subject to the same limitations as are applicable to flight training under chapter 30.

(Authority: 38 U.S.C. 1504(c), 1515(b))

§ 21.148 [Amended]

5. Section 21.148, paragraph (d) is amended by removing the words "or chapter 34" wherever they appear.

§ 21.254 [Amended]

6. Section 21.254, paragraph (b)(1) is amended by removing the words "or chapter 34" whichever they appear.

7. Section 21.256, paragraph (e)(2) and its authority citation are revised to read as follows:

§ 21.256 Incentives for employers.

* * * * *

(e) *Benefits and services.* * * *

(2) Notwithstanding any other provisions of these regulations, if the program in which the veteran is participating meets the criteria for approval of on-job training under chapter 30, the veteran may be paid at educational assistance rates provided for this type of training under chapter 30 to the extent that he or she has remaining eligibility and entitlement under chapter 30 and has elected to receive a subsistence allowance in accordance with § 21.7136.

(Authority: 38 U.S.C. 1508(f), 1516,(b), 1662(e))

* * * * *

§ 21.264 [Amended]

8. Section 21.264 is amended by removing the words "or chapter 34" and the words "and chapter 34" wherever they appear.

21.268 [Amended]

9. Section 21.268, paragraph (b) is amended by removing the words "or chapter 34" wherever they appear.

21.272 [Amended]

10. Section 21.272, paragraph (b)(1) is amended by removing the words "or chapter 34" wherever they appear.

21.276 [Amended]

11. Section 21.276, paragraph (g) is amended by removing the words "or chapter 34" wherever they appear.

21.320 [Amended]

12. Section 21.320, paragraph (b)(3) and (d)(3) are amended by removing the words "or chapter 34" wherever they appear.

21.330 [Amended]

13. Section 21.330, paragraph (a) is amended by removing the second sentence.

21.334 [Amended]

14. Section 21.334 is amended by removing the words "or chapter 34" and the words "and chapter 34" wherever they appear.

15. Section 21.334 is amended by revising paragraphs (a) and its authority citation, (b)(1), and (e)(2) and its authority citation to read as follows:

§ 21.334 Election of payments at the chapter 30 rate.

(a) *Election.* When the veteran elects payment of an allowance at the chapter 30 rate, the effective dates for commencement, reduction and termination of the allowance shall be in accordance with §§ 21.7130 through 21.7135 and § 21.7050 of this part under chapter 30.

(Authority: 38 U.S.C. 1808(f), 1780)

(b) *Election of payment at the chapter 30 rate subsequent to induction into a rehabilitation program.* * * *

(1) The commencing date determined under § 21.7131 of this part in the case of a veteran who has elected payment at the chapter 30 rate; or

* * * * *

(e) *Effect of chapter 34 program termination.* * * *

(2) A veteran entitled to chapter 30 benefits based on his or her chapter 34 eligibility as of December 31, 1989, and whose election of (payment of subsistence allowance at) chapter 34 rates (was) terminated as of that date under paragraph (1) must, if the individual desires payment (of subsistence allowance) at the chapter 30 rate, elect such payment.

(Authority: 38 U.S.C. 1411(a))

16. Section 21.340, paragraph (c) and its authority citation are revised to read as follows:

§ 21.340 Introduction.

* * * * *

(c) *Election of benefits at the chapter 30 rate.* If a veteran elects to receive a subsistance allowance paid at the chapter 30 rate, the effect of absences is determined under §§ 21.7139 and 21.7154 of this part.

(Authority: 38 U.S.C. 1508(f), and 1510)

BILLING CODE 8320-01-M

FEDERAL COMMUNICATIONS COMMISSION

47 CFR Part 73

[MM Docket No. 91-314; FCC 91-335]

Radio Broadcast Services

AGENCY: Federal Communications Commission.

ACTION: Proposed rule.

SUMMARY: The Notice of Proposed Rule Making seeks to develop a rule regarding broadcast hoaxes, which would codify licensee obligations and would permit the Commission to levy fines in order to address harmful hoaxes. The Notice proposes that any hoax rule include three elements: (1) False information; (2) public harm; and (3) foreseeability. As a framework for comment, the Notice includes a model hoax rule incorporating these three elements .

DATES: Comments must be submitted on or before January 2, 1992; reply comments must be submitted on or before February 3, 1992.

ADDRESSES: Federal Communication Commission, Washington, DC 20554.

FOR FURTHER INFORMATION CONTACT: Jane Hinckley, Mass Media Bureau, Policy and Rules Division, (202) 632-7792.

SUPPLEMENTARY INFORMATION: This is a synopsis of the Commission's Notice of Proposed Rule Making in MM Docket No. 91-314, adopted October 24, 1991, and released November 14, 1991.

The complete text of this Notice of Proposed Rule Making is available for inspection and copying during normal business hours in the FCC Dockets Branch (room 230), 1919 M Street NW., Washington, DC, and also may be purchased from the Commission's copy contractor, Downtown Copy Center, at (202) 452-1422, 1919 M Street NW., room 246, Washington, DC 20554.

Synopsis of Notice of Proposed Rule Making

1. In several recent incidents, stations have broadcast seemingly accurate programming that later proved to be a hoax. In those instances, the hoax resulted in the use of what may have been substantial public safety resources. The Notice proposes adoption of a rule prohibiting harmful hoaxes. Such a rule would permit the Commission to fine stations that perpetrate harmful hoaxes, thus allowing a sanction less drastic than license revocation but with more deterrence value than admonition. At the same time, however, the rule must not cause an undue chilling effect on broadcasters' speech.

2. With these factors in mind, the Notice proposes a hoax rule that includes three elements. First, the Notice proposes that to be held liable, a licensee must have known that the material was false. Second, the Notice proposes that the hoax must have directly caused immediate, substantial and actual public harm, and seeks comment on what types of harm should be considered. Third, the Notice proposes that the public harm must have been foreseeable. The Notice seeks comment regarding these three elements and asks some additional questions concerning the proper scope of any hoax rule. For example, the Notice asks whether the rule should prohibit only the broadcast of false reports of crimes or catastrophes rather than any false material. The Notice also notes that some hoaxes have the potential for substantial public harm but, fortunately, cause little quantifiable harm. The Notice questions whether the rule should cover these types of hoaxes by including the threat of harm, rather than actual harm, as one element. In addition, the Notice seeks comment regarding factors to be considered in determining whether the harm is foreseeable. To help guide and structure comments received in this proceeding, the Notice includes the following example of a possible hoax rule that incorporates the three elements described above:

No licensee of any broadcast station shall broadcast information or other material it knows to be false if it is foreseeable that broadcast of the information could cause substantial

public harm, and if broadcast of the information does in fact directly cause substantial public harm.

Note 1: For purpose of this rule, "public harm" is immediate, substantial and actual damage to the health and safety of the general public or to property, or substantial diversion of law enforcement or other public safety authorities from their duties.

Note 2: The public harm will be deemed foreseeable if the licensee could expect with a significant degree of certainty that public harm would occur. Foreseeability will not be inferred from warnings or disclaimers associated with the broadcast. Lack of foreseeability may be determined in light of factors such as the content of the broadcast or the timing of the broadcast (*e.g.*, April Fool's Day or Halloween).

Ex Parte Rules—Non-Restricted Proceeding

3. This is a non-restricted notice and comment rulemaking proceeding. See generally 47 CFR 1.1202, 1.1203 and 1.1206(a).

Comment Information

4. Pursuant to applicable procedures set forth in §§ 1.415 and 1.419 of the Commission's Rules, interested parties may file comments on or before January 2, 1992, and reply comments on or before February 3, 1992. All relevant and timely comments will be considered by the Commission before final action is taken in this proceeding.

Initial Regulatory Flexibility Analysis

5. We certify that the Regulatory Flexibility Act of 1980 does not apply to this rulemaking proceeding because if the proposed rule amendments are promulgated, there will not be a significant economic impact on a substantial number of small business entities, as defined by section 601(3) of the Regulatory Flexibility Act. Broadcasters will not be liable for a monetary forfeiture unless the Commission determines that the hoax rule has been violated and that a monetary forfeiture is warranted. The Secretary shall send a copy of this notice of Proposed Rule Making, including the certification, to the Chief Counsel for Advocacy of the Small Business Administration in accordance with paragraph 603(a) of the Regulatory Flexibility Act. Public Law No. 96–354, 94 Stat. 1164, 5 U.S.C. 601 *et seq.* (1981).

DEPARTMENT OF AGRICULTURE

Office of the Secretary

Solicitation of Recommendations for Nominees to the Alternative Agricultural Research and Commercialization Board

AGENCY: Office of the Secretary, Department of Agriculture.

ACTION: Solicitation of recommendations for nominees to the Alternative Agricultural Research and Commercialization Board.

SUMMARY: The U.S. Department of Agriculture is soliciting recommendations for nominees to the Alternative Agricultural Research and Commercialization Board (Board). The Board is to be appointed by the Secretary and is to be responsible for the general supervision and policy control of the Alternative Agricultural Research and Commercialization Center (Center) consistent with provisions of sections 1657–64 of Public Law No. 101–624, (7 U.S.C. 5901–5908).

DATES: Recommendations for nominees must be received on or before January 11, 1992.

SEND NOMINATIONS TO: Mark Dungan, room 200A, Office of the Secretary, USDA, Administration Building, Washington, DC 20250.

DOCUMENTATION REQUIRED: Please submit a resume addressing one or more of the categories set forth below. It is not expected that each nominee have education and work experience in each area. However, the Board, as a whole, should reflect the required experience and expertise.

MEMBERSHIP: 7 U.S.C. 5903 states that the Board shall consist of nine members:

1. One member who shall be an employee of the U.S. Department of Agriculture;
2. At least one member representative of the leading scientific disciplines relevant to the activities of the Center;
3. At least one member who is a producer or processor of agricultural commodities;
4. At least one member who is engaged privately in the commercialization of new nonfood, nonfeed products from agricultural commodities;
5. Two members who have expertise in areas of applied research relating to the development or commercialization of new nonfood, nonfeed products, appointed from a list of at least four persons nominated by the Director of the National Science Foundation; and
6. Two members who have expertise in financial and managerial matters, appointed from a list of at least four persons nominated by the Secretary of Commerce.

RESPONSIBILITIES: The Board shall:

1. Be responsible for the general supervision and policy control of the Center and any Regional Centers created under 7 U.S.C. 5907;
2. Determine (in consultation with the advisory council appointed under 7 U.S.C. 5905 and those Regional Centers established under 7 U.S.C. 5907) high priority commercialization areas to receive assistance under 7 U.S.C. 5905;
3. Review any grant, contract, or cooperative agreement to be made by the Center under 7 U.S.C. 5904 and any financial assistance to be provided under 7 U.S.C. 5905;
4. Make the final decision, by majority vote, on whether and how to provide assistance to an applicant;
5. Establish program policy, objectives, research and development, and commercialization priorities to implement sections 1657–64 of Public Law No. 101–624, through a process of public hearings to be initiated as soon as practicable after the establishment of the Board; and
6. Using the results of such hearings and other information and data collected under paragraph 5, develop and establish a budget plan and a long-term operating plan to implement sections 1657–64 of Public Law No. 101–624.

COMPENSATION AND TERM: The term of office of a Board member shall be four years, except that the members initially appointed shall be appointed to serve staggered terms. Board members who are officers or employees of the United States shall not receive any additional compensation by reason of service on the Board. Other members of the Board shall receive, for each day (including travel time) they are engaged in the performance of the functions of the Board, compensation at a rate not to exceed the daily equivalent of the annual rate in effect for grade GS–18 of the General Schedule. All Board members shall be reimbursed for travel, subsistence, and other necessary expenses incurred by them in performance of their duties to the limit allowed by the Department's Travel Regulations.

RESTRICTIONS: Nominees selected for further consideration will be required to submit financial and organizational affiliation disclosure statements.

ADDITIONAL INFORMATION: The Department of Agriculture has special interest in assuring that women, minority groups, and the physically handicapped are adequately represented on the Board and, therefore, extends particular encouragement for recommendations for nominees that are appropriately qualified female, minority, or physically handicapped candidates.

Dated: November 21, 1991.

Edward Madigan,

Secretary of Agriculture.

[FR Doc. 91–28410 Filed 11–26–91; 8:45 am]

BILLING CODE 3410–01–M

Federal Grain Inspection Service

Invitation To Serve on Federal Grain Inspection Service Advisory Committee

Under authority of section 20 of the United States Grain Standards Act (Act), the Secretary of Agriculture established the Federal Grain Inspection Service (FGIS) Advisory Committee (Advisory Committee) on September 29, 1981, to provide advice to the FGIS Administrator on inplementation of the Act. Public Law 100–518 extended the authority for the Advisory Committee through September 30, 1993. The Advisory Committee was renewed by the Secretary of Agriculture on January 16, 1991.

The Advisory Committee presently consists of 15 members, appointed by the Secretary, who represent the interests of grain producers, processors, handlers, merchandisers, consumers, and exporters, including scientists with expertise in research related to the policies in section 2 of the Act (7 U.S.C. 74). Members of the Committee serve

without compensation. They are reimbursed for travel expenses, including per diem in lieu of subsistence, for travel away from their homes or regular places of business in performance of Committee service, as authorized under section 5703 of title 5, United States Code.

Nominations are being sought for persons to serve 3-year terms on the Advisory Committee to replace the five members and five alternate members whose terms expire in February 1992.

Persons interested in serving on the Advisory Committee, or in nominating individuals to serve, should contact: John C. Foltz, Administrator, FGIS, room 1094–S, P.O. Box 96454, Washington, DC 20090–6454, in writing and request Form AD–755, which must be completed and submitted to the Administrator at the above address not later than January 27, 1991.

Nominations are open to all individuals without regard to race, color, religion, sex, national origin, age, mental or physical handicap, or marital status.

The final selection of Advisory Committee members and alternates will be made by the Secretary.

Dated: November 10, 1991.

John C. Foltz,

Administrator, Federal Grain Inspection Service.

[FR Doc. 91–28246 Filed 11–26–91; 8:45 am]

BILLING CODE 3410–EN–M

Rescission of Type Evaluation Handbook

AGENCY: Federal Grain Inspection Service, USDA.

ACTION: Notice.

SUMMARY: This notice announces the rescission of the FGIS Type Evaluation Handbook.

EFFECTIVE DATE: November 27, 1991.

ADDRESSES: David B. Funk, Chief, Quality Control and Testing Branch, Quality Assurance and Research Division, Federal Grain Inspection Service, USDA, Box 20285, Kansas City, MO 64195.

FOR FURTHER INFORMATION CONTACT: David B. Funk, address as above, telephone (816) 374–6518.

SUPPLEMENTARY INFORMATION: This action has been reviewed and determined not to be a rule or regulation as defined in Executive Order 12291 and Departmental Regulation 1512–1; therefore, the Executive Order and Departmental Regulation do not apply to this action.

Section 7B of the U.S. Grain Standards Act, as Amended (Act) specifies that the Administrator shall provide for testing of all equipment used in the sampling, grading, inspection, and weighing for the purpose of official inspection, official weighing, or supervision of weighing. Notwithstanding any other provision of law, no person shall use for the purpose of the Act any such equipment not approved by the Administrator.

On November 22, 1988, the Federal Grain Inspection Service published a handbook (Type Evaluation Handbook) pertaining to prototype equipment used for official purposes. The handbook contains criteria and performance standards, and sets forth procedures for submitting, evaluating, and approving such equipment. Since the handbook was published, there has been a considerable increase in the amount and types of prototype equipment submitted for evaluation. Due to that fact, the 1988 handbook is no longer suitable for further use in testing and evaluating equipment in a way which avoids unnecessary duplication of officially approved inspection equipment and which promotes uniform inspection of grain. For these reasons, the 1988 Type Evaluation Handbook is hereby rescinded and will no longer be used in evaluating and approving prototype equipment. In its place, FGIS is presently drafting a new publication regarding equipment evaluation procedures.

The rescission of the handbook does not affect the current regulations which provide for evaluation of prototype equipment upon a determination of need by FGIS. When an application is received, and it is determined that evaluation of a particular piece of equipment would be appropriate, FGIS will develop or recommend testing and evaluation procedures on a case-by-case basis.

Authority: Pub. L. 94–582, 90 Stat. 2867, as amended (7 U.S.C. 71 et seq.)

Dated: November 19, 1991.

John C. Foltz,

Administrator.

[FR Doc. 91–28247 Filed 11–26–91; 8:45 am]

BILLING CODE 3410–EN–M

Food Safety and Inspection Service

[Docket No. 91–033N]

Hazard Analysis and Critical Control Point (HACCP) Workshop—Solicitation of Participants; In-Plant Testing—Solicitation of Volunteers

AGENCY: Food Safety and Inspection Service, USDA.

ACTION: Notice.

SUMMARY: The Food Safety and Inspection Service (FSIS) intends to assist the meat and poultry industries in developing generic model Hazard Analysis and Critical Control Point (HACCP) plans. This notice solicits participation by technical experts from the meat and poultry industries at the workshop on Fresh Ground Beef to include the following 9 CFR 319.15 Miscellaneous Beef Products: Chopped beef, ground beef, hamburger, and beef patties. This workshop will be held December 3–5, 1991, at the Pointe on South Mountain, Phoenix, Arizona.

In addition, this notice also extends the deadline for volunteers for in-plant testing of the generic HACCP model for fresh ground beef as provided in the Agency's January 18, 1991, **Federal Register** notice. The notice provided that plants interested in participating in in-plant testing must notify FSIS by February 15, 1991. Potential volunteers for Fresh Ground Beef testing have requested that the Agency extend the entry deadline for participation in the in-plant testing program. This notice extends the deadline to January 6, 1992.

DATES: Interested participants for the workshop on Fresh Ground Beef to include the following 9 CFR 319.15 Miscellaneous Beef Products: Chopped beef, ground beef, hamburger, and beef patties should supply the requested information no later than November 29, 1991.

Letters of inquiry from persons interested in volunteering a plant for the in-plant testing study of the generic HACCP model for Fresh Ground Beef to include the following 9 CFR 319.15 Miscellaneous Beef Products: Chopped beef, ground beef, hamburger, and beef patties should be submitted by January 6, 1992.

FOR FURTHER INFORMATION CONTACT: Dr. Dorothy Stringfellow, Acting Director, HACCP Special Team, United States Department of Agriculture, Food Safety and Inspection Service, Room 2915, South Building, 14th and Independence Avenue, SW., Washington, DC 20250, (202) 690–2087.

SUPPLEMENTARY INFORMATION: FSIS recognizes the merits of HACCP as a system for sanitation and process control. The industries have expressed an interest in incorporating HACCP into the production of meat and poultry products. It is the intention of FSIS to assist the industries by conducting product specific workshops at which the industries will develop generic HACCP models. For this purpose, technical experts from the meat and poultry industries are being sought to work on

the development of a generic HACCP model for Fresh Ground Beef to include the following 9 CFR 319.15 Miscellaneous Beef Products: Chopped beef, ground beef, hamburger, and beef patties. Individuals or companies volunteering to participate in the development of the model during the workshop need not have previous experience in HACCP-based operations. In fact, it is desirable to include firms with varying degrees of prior HACCP experience.

The workshop on Fresh Ground Beef to include the following 9 CFR 319.15 Miscellaneous Beef Products: Chopped beef, ground beef, hamburger, and beef patties will be held on December 3–5, 1991, at the Pointe on South Mountain, 7777 S. Pointe Parkway, Phoenix, Arizona 85044.

Anyone interested in participating in the workshop on Fresh Ground Beef to include the following 9 CFR 319.15 Miscellaneous Beef Products: Chopped beef, ground beef, hamburger, and beef patties should submit a written request noting the following:

(1) Organization affiliation, i.e., national and/or local trade association(s), if any;

(2) Company, corporation, or independent operation represented by participant;

(3) Plant size, i.e., small, medium, or large; and

(4) Major product lines and approximate volumes.

The number of industry participants involved in the development of the generic HACCP models may have to be limited. If anyone is interested in participating in the workshop on Fresh Ground Beef to include the following 9 CFR 319.15 Miscellaneous Beef Products: Chopped beef, ground beef, hamburger, and beef patties and/or receiving technical information on the Agency's HACCP initiative, please submit written requests to Dr. Dorothy Stringfellow at the above address.

The workshop on Fresh Ground Beef to include the following 9 CFR 319.15 Miscellaneous Beef Products: Chopped beef, ground beef, hamburger, and beef patties will also be open to the public for observation. Space available for observers may be limited and seating will be based on a first come, first served basis. Therefore, those desiring to attend the workshop as observers are asked to submit requests in writing, indicating the following:

(1) Name, address, and phone number; and

(2) Name of company or corporation the observer is representing, if applicable.

Observers will be given an opportunity to comment during the course of the workshop session.

There is no registration fee, but transportation and per diem expenses must be borne by the participant or his/her sponsor.

A future **Federal Register** notice will be issued regarding site location, confirmation of time and date, and participation in the remaining workshop(s). The tentative schedule is as follows:

Month	Region	Product
March 1992	North Central	Swine slaughter (market hogs).

On January 18, 1991, FSIS published a notice in the **Federal Register** (56 FR 1972) soliciting volunteers for in-plant testing of the generic HACCP models developed at these workshops. The notice provided that plants interested in volunteering for in-plant testing must notify FSIS by February 15, 1991. Potential volunteers for Fresh Ground Beef to include the following 9 CFR 319.15 Miscellaneous Beef Products: Chopped beef, ground beef, hamburger, and beef patties have requested that the Agency extend the deadline for participation in the in-plant testing program. This notice extends the deadline to January 6, 1992.

Plants interested in volunteering as a test plant for the Fresh Ground Beef HACCP model or receiving more information on the in-plant test study should submit a written request to Dr. Stringfellow at the above address and note the following:

(1) Name, address, phone number, and establishment number;

(2) Affirmation that the plant is volunteering to test the Fresh Ground Beef HACCP model;

(3) Types of beef slaughtered;

(4) Affiliation, i.e., national and/or local trade association(s), if any;

(5) Fresh ground beef volume per year; and

(6) Type(s) of operation, e.g., New Line Speed Inspection System (NELS) or Streamlined Inspection System (SIS), and number of shifts.

Done at Washington, DC, on: November 7, 1991.

Ronald J. Prucha,

Acting Administrator.

[FR Doc. 91–28381 Filed 11–26–91; 8:45 am]

BILLING CODE 3410-DM-M

Forest Service

Main Bay Fish Hatchery Expansion, Chugach National Forest, Glacier Ranger District, Girdwood, AK

AGENCY: USDA, Forest Service.

ACTION: Notice of intent to prepare an environmental impact statement

SUMMARY: The Department of Agriculture, Forest Service, will prepare an Environmental Impact Statement (EIS) to analyze effects of doubling the size of the Main Bay Fish Hatchery on the Glacier Ranger District to increase sockeye salmon smolt releases to 20 million. The Record of Decision (ROD) will decide if the hatchery should be expanded and identify the conditions by which the expansion would be permitted. A ROD and Final Environmental Impact Statement (FEIS) was issued in April, 1980 by the Chugach National Forest Supervisor for the existing special use permit. The permit allowed the Alaska Department of Fish & Game (ADF&G) to construct and operate a salmon fish hatchery at Main Bay, Alaska.

DATES: Comments concerning the scope of the analysis should be received by December 16, 1991.

ADDRESSES: Written comments and suggestions concerning the scope of analysis must be sent to District Ranger, Glacier Ranger District, Chugach National Forest, P.O. Box 129, Girdwood, AK 99587.

FOR FURTHER INFORMATION CONTACT: Questions about the proposed action and EIS should be directed to Elaine Gross, Glacier Ranger District, Chugach National Forest, phone 907–783–3242.

SUPPLEMENTARY INFORMATION: The ADF&G Fisheries Rehabilitation, Enhancement and Development (F.R.E.D.) Division, proposes developing and implementing an expanded production program at the Main Bay Fish Hatchery. The proposed expansion would increase production capacity of the hatchery from the existing 5.1 million sockeye smolts to 20 million sockeye smolts. The proposed production capacity of Main Bay Fish Hatchery would produce about 4 million adult sockeye salmon.

Numerous facility improvements are needed to support the proposed expanded production capacity of Main Bay Fish Hatchery. The proposed improvements are the expansion of the hatchery rearing/incubation space, an increase in salt water rearing space, improvements to capacity and flexibility of the hatchery fresh water supply system, expanded staff housing

accommodations, and a new power generation facility. Fresh water requirements will double with expansion. Fresh water is obtained from Main Lake. The expansion would occur completely within the area currently under special use permit to the State of Alaska for the Main Bay Fish Hatchery.

The Responsible Official for the EIS is Regional Forester, Michael A. Barton, Alaska Region, Juneau, Alaska. He will select from a full array of alternatives presented in the EIS, including the alternative of "no action". At this early stage, possible alternatives to the proposed action are not known. Specific alternatives will be generated through public involvement.

Preliminary issues for the project are expected to include:

1. What effect will the expanded hatchery have on the character of the Nellie Juan-College Fjord wilderness study area?

2. What effect will increased numbers of sockeye salmon have on the commercial fishing industry in Prince William Sound?

3. What effect will hatchery expansion and increased sockeye salmon production have on subsistence resource use in Prince William Sound?

4. Will hatchery-raised Sockeye Salmon have a negative impact on Native fish stocks in Prince William Sound?

5. What effect will the hatchery and associated increased commercial fishing have on the recreation opportunities of western Prince William Sound?

The Alaska Department of Fish and Game, F.R.E.D. Division, will participate as a cooperating agency to evaluate compatibility of the proposed expansion on the overall goals and plans developed for Prince William Sound.

Public participation is very important throughout this analysis process. Key times for public involvement include the scoping process when input will be used to prepare the Draft Environmental Impact Statement (DEIS) and again after issuance of the DEIS before preparation of the Final Environmental Impact Statement (FEIS). The Forest Service will be seeking information, comments, and assistance from Federal, State, and local agencies, and other individuals or organizations who may be interested in or affected by the proposed action. Scoping is to begin in November, 1991. No public hearings or meetings are scheduled at this time. The public will be notified in advance when any public hearings and meetings are scheduled. The DEIS should be filed with EPA in May, 1992, and the final EIS filed in November, 1992.

The comment period on the DEIS will be 45 days from the date the Environmental Protection Agency publishes the notice of availability in the **Federal Register.**

The Forest Service believes, at this early stage, it is important to give reviewers notice of several court rulings related to public participation in the environmental review process. First, reviewers of the DEIS must structure their participation in the environmental review of the proposal so that it is meaningful and alerts an agency to the reviewer's position and contentions. *Vermont Yankee Nuclear Power Corp.* v. *NRDC*, 435 U.S. 519, 553 (1978). Also, environmental objections that could be raised at the DEIS stage but that are not raised until after completion of the FEIS may be waived or dismissed by the courts. *City of Angoon* v. *Hodel*, 803 F.2d 1016, 1022 (9th Cir. 1988) and *Wisconsin Heritages, Inc.* v. *Harris*, 490 F. Supp. 1334, 1338 (E.D. Wis. 1980). Because of these court rulings, it is very important that those interested in this proposed action participate by the close of the comment period so that substantive comments and objections are made available to the Forest Service at a time when it can meaningfully consider them and respond to them in the FEIS.

To assist the Forest Service in identifying and considering issues and concerns on the proposed action, comments on the DEIS should be as specific as possible. It is also helpful if comments refer to specific pages or chapters of the draft statement. Comments may also address the adequacy of the DEIS or the merits of the alternatives formulated and discussed in the statement. (Reviewers may wish to refer to the Council on Environmental Quality Regulations for implementing the procedural provisions of the National Environmental Policy Act at 40 CFR 1503.3 in addressing these points).

Permits required for implementation include the following:

1. U.S. Army Corps of Engineers:

Approval of the discharge of dredged or fill materials into waters of the United States, under section 404 of the Clean Water Act.

Approval of the construction of structures or work in navigable waters of the United States, under section 10 of the River and Harbor Act of 1899.

2. U.S. Environmental Protection Agency:

National Pollutant Discharge Elimination System (402) permit for discharge of wastewater into waters of the United States.

3. U.S. Federal Energy Regulatory Commission:

License for the generation of electric power.

4. State of Alaska, Department of Environmental Conservation:

Certificate of Reasonable Assurance for the discharge of wastewater into the ocean.

5. State of Alaska, Department of Natural Resources:

Permit to place structures in streams or wetlands (Form 10–106).

Water use permit for use of fresh water (Form 10–102).

Site grading permit.

6. State of Alaska, Department of Fish and Game:

Anadromous fish protection permit.

Permit to alter a natural stream channel or stream bank.

Hatchery permit.

Explosives permit.

Michael A. Barton, Regional Forester, USDA Forest Service, Box 21628, Juneau, Alaska, 99802, is the responsible official. The responsible official will consider the comments, responses, disclosure of environmental consequences, and applicable laws, regulations, and policies in making a decision regarding this proposal. The responsible official will document the decision and rationale in the ROD.

Dated: November 15, 1991.

Michael A. Barton,

Regional Forester.

Respondents

Decision and Order

On February 22, 1991, then Assistant Secretary for Export Enforcement, Quincy M. Krosby, issued a temporary denial order (TDO) for 180 days naming Delft Instruments N.V., located in the Netherlands, also known as Oldelft, Old Delft, Olde Delft, Oude Delft (hereinafter referred to as Delft); Delft Instruments Electro-Optics, Delft Electronische Products and Optische Industrie Oude Delft; OIP Instrubel, a Delft subsidiary located in Belgium, and Franks & Co. Optik GmbH,[1] a Delft subsidiary located in Germany, as persons temporarily denied all U.S. export privileges. 56 FR 8321 (February 28, 1991). On August 21, 1991, then-Acting Assistant Secretary for Export Enforcement, Kenneth A. Cutshaw, renewed that TDO for 90 days and modified it to name specifically all of Delft's 47 subsidiaries as persons related to Delft and, as such, also denied export privileges. 56 FR 42977 (August 30, 1991).[2] Without renewal, the TDO will expire on November 19, 1991.

On October 30, 1991, the Office of Export Enforcement, Bureau of Export Administration, United States Department of Commerce (Department), filed a request with me asking me to renew again the TDO against Delft and all of its subsidiaries for 180 days. Since then, I have reviewed the Department's request and Delft's opposition thereto. I have also had discussions with representatives of the Department and Delft. Based thereon, I have decided to renew the TDO for 90 days with regard to Delft's defense-related entities because I find that such a renewal is necessary in the public interest to prevent an imminent violation of the Export Administration Regulations (currently codified at 15 CFR parts 768–799 (1991)) (the Regulations), issued pursuant to the Export Administration Act of 1979, as amended (currently codified at 50 U.S.C.A. app. 2401–2420 (1991)) (Act).[3] However, with regard to Delft's civil-sector entities, I find that such a renewal is not warranted.

Accordingly, it is hereby Ordered:

I. Effective November 19, 1991, the TDO in effect against Delft and certain related parties shall expire and have no effect, except that, it shall continue in effect with regard to those Delft subsidiaries with a significant involvement in defense-related business. Accordingly, all outstanding validated export licenses in which Delft Instruments Defense BV, Van Miereveleltlaan 9, P.O. Box 72, Delft, Netherlands; INSTRUBEL NV, Westerring 19, B–9700 Oudenaarde, Belgium; OIP NV Westerring 21 B–9700 Oudenaarde, Belgium; Franke Systemtechnik GmbH Philosophenstrasse 116 Postfach 5420, 6300 Giessen/Lahn Germany; Odelft Electronic Instruments SRI Via G. Armellini 20, 00143 Rome, Italy; Delft Electronische Producten, Dwazziewegen 2, P.O. Box 60 9300 AB Roden, Netherlands; and Delft Instruments Electro-Optics BV Van Miereveltlaan 9, P.O. Box 5083, 2600 GB Delft, Netherlands, appear or participate, in any manner or capacity, are hereby revoked and shall be returned forthwith to the Office of Export Licensing for cancellation. Further, all of respondents' privileges of participating, in any manner or capacity, in any special licensing procedure, including, but not limited to, distribution licenses, are hereby revoked.

II. Respondents Delft Instruments Defense BV, Instrubel NV, OIP NV, Franke Systemtechnik GmbH, Odelft Electronic Instruments SRI, Delft Electronische Producten and Delft Instruments Electro-Optics BV, their successors, assignees, officers, partners, representatives, agents, and employees, hereby are denied all privileges of participating, directly or indirectly, in any manner or capacity, in any transaction in the United States or abroad involving commodities or technical data exported or to be exported from the United States, in whole or in part and subject to the Regulations. Without limiting the generality of the foregoing, participation, either in the United States or abroad, shall include participation, directly or indirectly, in any manner or capacity: (a) As a party or as a representative of a party to any export license application submitted to the Department; (b) in preparing or filing with the Department any export license application or reexport authorization, or any document to be submitted therewith; (c) in obtaining from the Department or using any validated or general export license, reexport authorization or other export control document; (d) in carrying on negotiations with respect to, or in receiving, ordering, buying, selling, delivering, storing, using, or disposing of, in whole or in part, any commodities or technical data exported or to be exported from the United States subject to the Regulations; and (e) in financing, forwarding, transporting, or other servicing of such commodities or technical data. Such denial of export privileges shall extend only to those commodities and technical data which are subject to the Act and the Regulations.

III. After notice and opportunity for comment, such denial may be made applicable to any person, firm, corporation, or business organization with which either Delft Instruments Defense BV, Instrubel NV, OIP NV, Franke Systemtechnik GmbH, Odelft Electronic Instruments SRI, Delft Electronische Producten or Delft Instruments Electro-Optics BV, is now or hereafter may be related by affiliation, ownership, control position of responsibility, or other connection in the conduct of trade or related services.

IV. As provided for in section § 787.12(a) of the Regulations, without prior disclosure of the facts to and specific authorization of the Office of Export Licensing, in consultation with the Office of Export Enforcement, no person may directly or indirectly, in any manner or capacity, with respect to U.S.-origin commodities and technical data: (i) Apply for, obtain, or use any license, Shipper's Export Declaration, bill of lading, or other export control document relating to an export or reexport of commodities or technical data by, to, or for another person then subject to an order revoking or denying his export privileges or then excluded from practice before the Bureau of Export Administration; or (ii) order, buy, receive, use, sell, deliver, store, dispose of, forward, transport, finance, or otherwise service or participate (a) in any transaction which may involve any commodity or technical data exported or to be exported from the United States, (b) in any reexport thereof, or (c) in any other transaction which is subject to the Export Administration Regulations, if the person denied export privileges may obtain any benefit or have any interest in, directly or indirectly, any of these transactions.

V. In accordance with the provisions of Section 788.19(e) of the Regulations, any respondent may, at any time, appeal this temporary denial order by filing with the Office of the Administrative Law Judge, U.S. Department of Commerce, room H–6716, 14th Street and Constitution Avenue, NW., Washington, DC, 20230, a full written statement in support of the appeal.

---

[1] Since the time the TDO was originally issued, I have learned that the correct spelling of "Franks & Co. Optik GmbH" is "Franke & Co. Optik GmbH."

[2] The TDO was modified again on October 18, 1991 to delete B.V. Enraf-Nonius Ermelo as a person related to Delft, based on evidence proffered by Delft that it had sold that entity. 56 FP 55491 (October 26, 1991).

[3] The Act expired on September 30, 1990. Executive Order 12730 (55 FR 40373, October 2, 1990) continued the Regulations in effect under the International Emergency Economic Powers Act (50 U.S.C.A. 1701–1706 (1991)).

VI. This order is effective immediately and shall remain in effect for 90 days.

VII. In accordance with the provisions of § 788.19(d) of the Regulations, the Department may seek renewal of this temporary denial order by filing a written request not later than 20 days before the expiration date. Any respondent may oppose a request to renew this temporary denial order by filing a written submission with the Assistant Secretary for Export Enforcement, which must be received not later than seven days before the expiration date of this order.

A copy of this order shall be served on each respondent and this order shall be published in the **Federal Register**.

Entered this 19th day of November, 1991.

Douglas E. Lavin,

Acting Assistant Secretary for Export Enforcement.

BILLING CODE 3510-01-M

Foreign-Trade Zones Board

[Docket No. 75-91]

Foreign-Trade Zone 54—Portland, Oregon Application for Subzone Tofle Stainless Steel Tubing Plant Tualatin, OR (Portland Port of Entry)

An application has been submitted to the Foreign-Trade Zones Board (the Board) by the Port of Portland, grantee of FTZ 45, Portland, Oregon, requesting special-purpose subzone status for export manufacturing at the stainless steel tubing plant of Tofle U.S.A., Inc. (subsidiary of Tofle Co., Japan), located in Tualatin, Oregon. The application was submitted pursuant to the provisions of the Foreign-Trade Zones Act, as amended (19 U.S.C. 81a–81u), and the regulations of the Board (15 CFR part 400). It was formally filed on November 6, 1991.

The plant (3.2 acres, 10,000 sq. ft.) is located at 10850 S.W. Leveton Dr., Tualatin, Oregon, some 4 miles southwest of Portland. The facility is used to manufacture flexible, stainless steel tubing (⅜-inch to 12 inches in diameter). The majority of the materials and components are purchased from abroad, including stainless steel sheet, stainless steel wire and cast iron fittings. All of the products manufactured under zone procedures would be exported.

Zone procedures would exempt Tofle from Customs duty payments on the foreign materials and components used in its export production. The applicant indicates that zone savings will improve the plant's competitiveness in international markets.

In accordance with the Board's regulations, an examiners committee has been appointed to investigate the application and report to the Board. The committee consists of: Dennis Puccinelli (Chairman), Foreign-Trade Zones Staff, U.S. Department of Commerce, Washington, DC 20230; Thomas W. Hardy, District Director, U.S. Customs Service, Pacific Region, 511 N.W. Broadway Federal Bldg., Portland, Oregon 97209; and, Major General Ernest J. Harrell, District Engineer, U.S. Army Engineer District Portland, P.O. Box 2870, Portland, Oregon 97208–2870.

Comments concerning the proposed foreign-trade subzone are invited from interested parties. They should be addressed to the Board's Executive Secretary at the address below and postmarked on or before January 10, 1992.

A copy of the application and accompanying exhibits will be available for public inspection at each of the following locations:

U.S. Department of Commerce District Office, Suite 242, One World Trade Center, 121 SW Salmon Street, Portland, Oregon 97204

Office of the Executive Secretary, Foreign-Trade Zones Board, U.S. Department of Commerce, Room 3716, 14th Street and Constitution Avenue, NW., Washington, DC 20230

Dated: November 19, 1991.

Dennis Puccinelli,

Acting Executive Secretary.

BILLING CODE 3510-DS-M

[Docket No. 76-91]

Foreign-Trade Zone 39—Dallas/Fort Worth, TX; Application for Expansion

An application has been submitted to the Foreign-Trade Zones Board (the Board) by the Dallas/Fort Worth International Airport Board, grantee of FTZ 39, requesting authority to expand its zone at the Dallas/Fort Worth International Airport. The application was submitted pursuant to the provisions of the Foreign-Trade Zones Act, as amended (19 U.S.C. 81a–81u), and the regulations of the Board (15 CFR part 400). It was formally filed on November 6, 1991.

FTZ 39 was approved on August 17, 1978 (Board Order 133, 43 FR 37478, 8/23/78). It currently consists of three parcels (250 acres) located within the northeastern portion of the Dallas/Fort Worth International Airport complex.

The grantee is now requesting authority to expand the zone to include additional facilities (2,150 acres) within the 18,000-acre airport complex, such as industrial park sites and the airport's aviation fuel storage and distribution facility. The zone project is operated by Sekin Transport International, Inc. No manufacturing requests are being made at this time. Such approvals would be requested from the Board on a case-by-case basis.

In accordance with the Board's regulations, an examiners committee has been appointed to investigate the application and report to the Board. The committee consists of: John J. Da Ponte, Jr. (Chairman), Director, Foreign-Trade Zones Staff, U.S. Department of Commerce, Washington, DC 20230; Donna De La Torre, Director, Office of Inspection and Control, U.S. Customs Service, Southwest Region, 5850 San Felipe Street, Suite 500, Houston, Texas 77057–3012; and, Colonel John A. Mills, District Engineer, U.S. Army Engineer District Fort Worth, P.O. Box 17300, Fort Worth, Texas 76102–0300.

Comments concerning the proposed expansion are invited in writing from interested parties. They should be addressed to the Board's Executive Secretary at the address below and postmarked on or before January 13, 1991.

A copy of the application is available for inspection at each of the following locations:

U.S. Department of Commerce, District Office, room 7A5, 1100 Commerce Street, Dallas, Texas 75242.

Office of the Executive Secretary, Foreign-Trade Zones Board, U.S. Department of Commerce, room 3716, 14th & Pennsylvania Avenue NW., Washington, DC 20230.

Dated: November 20, 1991.

Dennis Puccinelli,

Acting Executive Secretary.

BILLING CODE 3510-DS-M

International Trade Administration A-428-602

Brass Sheet and Strip From the Federal Republic of Germany; Final Results of Antidumping Duty Administrative Review

AGENCY: International Trade Administration/Import Administration, Department of Commerce.

ACTION: Notice of final results of antidumping duty administrative review.

SUMMARY: On July 10, 1990, the Department of Commerce (the Department) published the preliminary results of its administrative review of the antidumping duty order on brass sheet and strip from the Federal Republic of Germany (Germany). The review covers five manufacturers and/or exporters of this merchandise for the period August 22, 1986 through February 29, 1988. Three of these five firms, Wieland Werke AG and its wholly-owned subsidiaries, Langenberg Kupfer- und Messingwerke GmbH KG and Metallwerke Schwarzwald GmbH, had shipments to the United States during the period of review (POR). Another firm, William Prym, failed to respond to the Department's antidumping questionnaire. For this firm we used the best information available (BIA) for assessment and cash deposit purposes. We determined the BIA to be the highest rate for a responding firm during this review period. One firm, Schwermetall Halbzeugwerke, had no shipments to the United States during the POR. For this firm, we used the "all other" rate established during the LTFV investigation.

We gave interested parties an opportunity to comment on the preliminary results. Based on our analysis of the comments received and the correction of certain clerical errors, we have changed the margins for Wielamd-Werke AG and its wholly-owned subsidiaries, Langenberg Kupfer- und Messingwerke GmbH KG and Metallwerke Schwarzwald GmbH, hereinafter collectively referred to as "the Weiland Group", from 7.94 percent to 19.59 percent.

EFFECTIVE DATE: November 27, 1991.

FOR FURTHER INFORMATION CONTACT: J. David Dirstine, Michael Diminich, or Richard Rimlinger, Office of Antidumping Compliance, International Trade Administration, U.S. Department of Commerce, Washington, DC 20230, telephone: (202) 377–4733.

SUPPLEMENTARY INFORMATION:

Background

On July 10, 1990, the Department published in the **Federal Register** (55 FR 28264) the preliminary results of its administrative review of the antidumping duty order on brass sheet and strip from the Federal Republic of Germany (52 FR 6997, March 6, 1987). The Department has now completed that administrative review in accordance with section 751 of the Tariff Act of 1930, as amended (Tariff Act) 19 U.S.C. 1675).

Scope of Review

Imports covered by the review are shipments of brass sheet and strip, other than leaded brass and tin brass sheet and strip, from Germany. The chemical composition of the products covered is currently defined in the Copper Development Association (C.D.A.) 200 series of the Unified Numbering System (U.N.S.) C20000 series. Products whose chemical composition are defined by other C.D.A. or U.N.S. series are not covered by this review. The physical dimensions of the products covered by this review are brass sheet and strip of solid rectangular cross section over 0.006 inches (0.15 millimeters) through 0.188 inches (4.8 millimeters) in finished thickness or gauge, regardless of width. Coiled, wound on reels (traverse wound) and cut-to-length products are included. During the review period, such merchandise was classified under item numbers 612.3960, 612.3982, 612.3986 of the Tariff Schedules of the United States Annotated (TSUSA). This merchandise is currently classifiable under Harmonized Tariff Schedule (HTS) item numbers 7409.21.00 and 7409.29.00. The TSUSA and HTS item numbers are provided for convenience and for Customs purposes. The written descriptions remain dispositive.

The review covers five manufacturers and/or exporters of this merchandise for the period August 22, 1986 through February 29, 1988.

Analysis of Comments Received

We gave interested parties an opportunity to comment on the preliminary results. We received comments from the petitioner and the Wieland Group, respondent.

Comment 1: Respondent asserts that some of the made-to-order merchandise it sells in both the home market and the United States differs in specific physical characteristics (*i.e.*, camber, suitability for electropolishing, etc.) even within the product groupings established by the Department. Therefore, respondent claims that in comparing U.S. merchandise to its similar home market merchandise, an adjustment should be made to account for these cost-based differences.

Department's Position: The Department matched categories of "such or similar" merchandise based on the primary characteristics of material (sheets or strips), coating (tinned/non-tinned), grade (alloy composition), and dimensions (gauge and width). In the April 21, 1988 questionnaire, and in the supplemental questionnaire, the Department requested information on costs reflecting the differences in merchandise (difmer) for the primary characteristics of gauge and width. The Wieland Group failed to provide this information. The Wieland Group did provide difmer data for "special characteristics" which, as secondary characteristics, are not considered in determining the product matching hierarchy. Respondent, however, provided standard cost data, not actual cost data, to support this difmer claim. In addition, the Wieland Group failed to segregate the total material cost segment, the direct labor cost segment, and the direct factory overhead cost segment of each of these claims, as requested by the Department in both the questionnaire and the supplemental request for information.

Because of these reporting deficiencies with respect to differences attributable to "special characteristics" and the Wieland Group's failure to report the requested difmer data for the primary characteristics of gauge and width, the Department has denied respondent's difmer claim for "special characteristics".

Comment 2: Respondent claims that the Department should grant a cost-based quantity discount adjustment on its home market sales, because there is a significant difference between the average order size in the United States and the home market. Respondent states that, consistent with the initial LTFV investigation, it conservatively calculated only the cost differences that are attributable to quantity. Respondent further asserts that it carefully and correctly calculated the cost savings for different production quantities, with all other variables held constant.

Respondent further contends that the Department's preliminary decision not to accept its cost-based quantity adjustment was based on its erroneous perception that there was no direct correlation between prices and quantities sold. Respondent asserts that a correlation between price and quantity is unnecessary to establish a valid claim to a cost-based quantity adjustment. See 19 CFR 353.55(b)(2) (1990). Assuming, *arguendo*, that such a correlation is necessary, however, respondent claims that it has demonstrated that one exists.

Petitioner counters that respondent's contention that a difference in average order size between the two markets entitles it to a cost-based quantity adjustment is erroneous. Petitioner states that respondent has chosen an improper basis upon which to claim this adjustment and that the regulations clearly state that the differences in cost incurred must be attributable to the production of the different quantities

involved. Petitioner asserts that respondent failed to provide a detailed breakout of its production planning, data processing, and shipping documentation costs. Petitioner further asserts that the production costs reported by respondent appear to be fixed costs and, thus, not directly related to the production of the subject merchandise.

With respect to respondent's contention that it has demonstrated that a correlation between price and quantity exists, petitioner responds that respondent failed to hold all variables, except the quantity variable, constant. It adjusted its analysis for differences in so-called special characteristics or secondary matching criteria, and failed to adjust its analysis for differences in primary physical characteristics such as alloy, gauge and width. Respondent merely grouped all alloys, gauges and widths—regardless of the date of sale—in each of its five product categories to arrive at its reported weighted-average unit price, by quantity grouping.

Department's Position: As stated in Brass Sheet and Strip from the Netherlands, 53 FR 2341 (1988), "the controlling requirement of § 353.14 (353.55(a) under the new antidumpting regulations) is that, to be eligible for a quantity-based adjustment, a respondent must demonstrate a clear and direct correlation between price differences and quantities sold or costs incurred." The exporter must clearly demonstrate that discounts are warranted on the basis of savings which are specifically attributable to longer production runs. The Department maintains that respondent failed to take into account price differences due to differences in alloy composition and gauge and width. In addition to failing to hold all variables, except the quantity variable, constant, the Wieland Group has not adequately demonstrated a correlation between prices and savings specifically attributable to different production quantities.

Comment 3: Respondent asserts that the Department improperly compared further-processed exporter's sales price (ESP) prices, reduced by the amount of value added by further United States processing, to the price of further-processed products in the home market not similarly reduced for value added. Respondent contends that this resulted in the unfair comparison of the ESP price of an unprocessed product to the home market price of a processed product. The Wieland Group claims that because the processed product is more costly to produce and commands a higher price, the Department's comparison unfairly skews the results. Respondent contends that the Department should either not deduct U.S. value added from exporter's sales price or should compare the adjusted ESP sales to appropriate, adjusted home market sales.

Department's Position: Section 772(e)(3) of the Tariff Act mandates that we calculate the price and compare ESP sales in the form in which the merchandise enters the United States. In both the original questionnaire and the request for supplemental information, the Department requested the Wieland Group to report the form in which products used for further processing are imported. The Wieland Group failed to report this information and reported specifications for value added merchandise on an "as sold" basis only. Because respondent did not report the information required by the Department to match further-processed U.S. sales on an "as imported" basis, we deducted the U.S. value added to further-processed merchandise and, as BIA, made comparisons on an "as sold" basis.

Comment 4: Respondent claims that the Department's failure to adjust reasonably for the effect of dramatic metal price fluctuations that occurred during the POR created fictitious margins. It contends that because metal prices varied widely on a daily basis and are entirely outside its pricing control, it is impossible to compare U.S. and home market sales made on different dates without some adjustment.

Department's Position: We are not convinced by information on the record that we should alter our position here from that of the preliminary results. Circumstance of sale adjustments are normally only allowed for differences in selling expenses related to sales being compared, not differences in raw material costs, and would therefore be inappropriate in this case. Difference in merchandise adjustments would also be inappropriate unless there is a physical difference in merchandise being compared. Furthermore, for the majority of the POR (August 22, 1986 through February 29, 1988), metal values were relatively stable. Significant fluctuations in metal values did not occur until the latter part of 1987. However, when the Department compares U.S. sales to monthly weighted-average contemporaneous home market sales, the weighting process itself reduces the potential for distortion in price comparisons. Also, our use of only contemporaneous sales for comparison purposes further reduces the potential for such distortion. Therefore, for the above reasons, we do not believe there is need for any other metal price fluctuation adjustments.

Comment 5: Petitioner contends that the Department erred when it used as BIA the weighted-average margin of reviewable sales for those sales in which respondent failed to provide cost adjustment information for difmer adjustments. For such sales, petitioner asserts that the Department should use either the highest transaction margin or the difmer data submitted by petitioner in its submission of February 17, 1989.

Department's Position: In accordance with Section 776(c) of the Tariff Act, the Department has applied BIA for those sales for which we did not have matches. Normally, the Department will make difference in merchandise (difmer) adjustments in order to compare non-identical merchandise. Because the Wieland Group failed to report difmer information to allow the Department to make comparisons on the unmatched sales, for the final results of this review we have used the highest weighted-average margin for any member of the Wieland Group as BIA for the unmatched sales.

Comment 6: Petitioner contends that the Department failed to adjust accurately for differences in merchandise due to differences in alloys. Petitioner asserts that the Department should have compared transactions on the basis of an exact alloy match. Petitioner states, for example, that a comparison of C.D.A. alloy 260 with C.D.A. alloys 270 and 274, without an adjustment to account for differences in metal content, will result in inaccurate comparisons.'

Department's Position: We maintain our position that, in formulating such or similar product groupings, it is appropriate to group alloys according to their copper content. Of the two metals which comprise brass, copper and zinc, copper generally constitutes the larger input in an alloy, and is also more expensive than zinc. However, for non-identical product comparisons within a such or similar group, we did make an adjustment for physical differences in alloy composition based on London Metal Exchange settlement prices.

Comment 7: Petitioner contends that the Department incorrectly understated the Wieland Group's U.S. value-added amount for sales it further processed in the United States, and that respondent did not supply the Department with information on the following four value-added components: (1) U.S. manufacturing costs incurred by the Wieland Groups's U.S. production affiliate, Wieland-Metals, to roll the

brass merchandise; (2) an allocated portion of the general and administrative expenses incurred by the Wieland Group's U.S. sales affiliate, Wieland-America; (3) an allocated portion of Wieland-Metals' and Wieland-America's general, selling and administrative expenses incurred in Germany in association with U.S. value-added operations; and (4) an allocated portion of profit. Petitioner contends that since the Wieland Group failed to provide U.S. rolling costs, the Department should use BIA to determine the U.S. processing amount on the Wieland Group's rerolled sales. Petitioner has provided data for use as BIA in a February 17, 1989 letter to the Department.

Respondent contends that it rolled only a very small quantity of the total merchandise under review. Moreover, because of its start-up nature, the production costs associated with the fledgling reroll operations were not kept in normal cost records. Given the insignificant amount of rerolled material and the nonrepresentative nature of rerolling costs during testing, respondent asserts that the Department correctly decided not to adjust the prices of these sales. Respondent further states that the Department should not double count U.S. selling expenses by including them in the value added calculation.

Department's Position: With respect to U.S. manufacturing costs incurred by Wieland Metals to roll the brass merchandise, respondent did not provide the Department, as requested, with its reroll processing costs, nor did it identify those rerolled sales which were not subject to slitting and traverse winding. Therefore, for purposes of these final results, we have used BIA for those sales that were rerolled. We determine BIA to be the highest weighted-average margin for any member of the Wieland Group. With respect to those U.S. sales for which there was further processing but not rerolling, we did not allocate a portion of Wieland America's general, selling and administrative expenses because those sales were not made through Wieland America. Since Wieland Metals handled all such U.S. sales, a portion of that firm's general, selling and administrative expenses was allocated to the total U.S. value-added amount. In addition, any general, selling and administrative expenses incurred in Germany in support of U.S. sales were not included because, under section 772(e)(3) of the Tariff Act, we can only deduct any increase in value resulting from a process of manufacture or assembly performed on the imported merchandise after its importation. Finally, with respect to profit, we did not include profit in the total value-added amount because respondent's data indicated that Wieland Metals had not profit during the POR.

Comment 8: Petitioner argues that respondent failed to substantiate its home market credit claim and, therefore, the Department should not adjust for home market credit. Petitioner further argues that the Department incorrectly calculated respondent's U.S. purchase price credit expense claim based on a higher interest rate than was used to calculate the home market credit expense.

Department's Position: Respondent did not furnish actual credit interest rates applicable to home market sales or U.S. sales. In its response, the Wieland Group submitted a range of short-term interest rates offered by its banks during the POR. Since we do not have actual interest rates identified for sales to each market, for purposes of these final results, as BIA for the credit expense adjustments, we have used the highest interest rate in the range for home market sales and the lowest interest rate in the range for U.S. sales.

Comment 9: Petitioner asserts that respondent failed to explain why the interest rate associated with its consignment credit claim is a higher percentage than the interest rate associated with its home market claim.

Respondent argues that the direct credit expenses associated with its post-sale consignment arrangements are properly calculated using the company's long-term borrowing rate, which is higher than the short-term borrowing rate.

Department's Position: We agree with respondent for the reasons outlined in a proprietary memorandum to the file dated November 8, 1991, from Michael Diminich, Analyst, Office of Antidumping Compliance.

Comment 10: Petitioner argues that the Department should be consistent in its treatment of inventory expenses because these expenses are identical in each market. In its preliminary analysis, the Department treated the home market inventory expenses as direct selling expenses and the U.S. inventory expenses as indirect selling expenses. Petitioner claims that, whether incurred on behalf of a home market customer or on behalf of a U.S. customer, expenses associated with inventory were incurred for identical reasons. Petitioner asserts that the only difference between the home market and U.S. inventory expenses was the label respondent assigned to these expenses. Respondent characterized its U.S. inventory expenses as "buffer stocks" and claimed that they were indirect selling expenses. In contrast, it characterized its home market buffer stocks as "consignment" sales and claimed they constituted direct selling expenses.

Department's Position: The Department recognizes these credit expenses on consignment inventory as post-sale, direct expenses because these expenses are directly related to individual sales to a specific customer. Such consignment sales, however, exist only in the home market. In contrast, pre-sale credit expenses for buffer stock arrangements on the U.S. sales are not related to specific sales or specific customers. In buffer stock arrangements, a potential customer is not obligated to purchase the products and the Wieland Group can withdraw merchandise from buffer stocks and ship it to any customer. Credit expenses associated with buffer stock arrangements are, therefore, indirect pre-sale warehousing expenses.

Comment 11: Petitioner argues that the Department neglected to make an adjustment for respondent's inventory holding period for U.S. sales. The inventory holding period for these sales should represent the period between the time that the brass merchandise was shipped from respondent's German facility and the time that the merchandise was shipped from respondent's U.S. facility. Respondent reported that the holding period for merchandise shipped to the U.S. is 14 weeks. Therefore, petitioner argues, in the final results, the Department should calculate respondent's indirect credit expense adjustment based on an inventory period of 98 days.

Department's Position: We agree. In cases involving ESP transactions, we include the costs of financing inventory in our calculation of indirect selling expenses. (See, *e.g.*, Antifriction Bearings from the Federal Republic of Germany, 54 FR 18992, App. B; Sect. 12 (1989)). We calculated respondent's indirect credit expense adjustment based on an inventory period of 98 days.

Comment 12: Petitioner contends that the Department incorrectly accepted hypothetical sales prices, as opposed to actual selling prices, for certain home market sales made under one of respondent's two split-pricing billing options which are offered to certain home market customers. Under these split-pricing billing options, participating customers purchase metal from respondent, who establishes a metal account against which customers can draw for future orders. Split-pricing

entails breaking down the total price paid into that portion of the price attributable to metal costs and that attributable to fabrication costs. Respondent reports that it bills its split-pricing customers' accounts in one of two methods. Under the first method, respondent bills the customer at the time of delivery of the merchandise for both the metal and fabrication portions of the price. Under the second method, respondent bills the participating customer separately for fabrication and for metal, as the latter is credited to the customer's metal account.

Respondent states that under the second billing method it cannot match the actual metal price, *i.e.*, the metal price at the time the participating customers' accounts are credited, to specific sales. Therefore, to calculate the total sales price for the split-pricing sales under this method, respondent added to the fabrication price the official German metal price in effect on the date of sale.

Respondent further explained that it reduced these date-of-sale metal prices by a customary metal discount and an early payment discount that the Wieland Group receives. Petitioner argues that respondent, under the second billing method, constructed a metal price that does not reflect the actual metal price its customer paid for the metal. Further, petitioner states that respondent not only failed to report its actual metal prices for these subject split-priced sales, but also did not demonstrate that it received a metal discount or early payment discount on all of its split-pricing metal purchases. Therefore, petitioner contends that the Department should add the reported metal discount and early payment discount to each home market sale.

Department's Position: The Department requested that respondent provide the actual metal price charged to home market customers purchasing on a split-priced basis who were billed separately for the metal value portion of the sale. Respondent failed to provide the requested information and failed to provide an acceptable constructed price that was representative of actual prices charged. In addition, the Wieland Group reported early payment and metal discounts on all split-pricing metal purchases. However, the Wieland Group failed to demonstrate that it actually received these discounts on all split-pricing metal purchases. Therefore, we accepted information submitted by petitioner as BIA with respect to the total sale price and adjusted all home market prices to levels applicable to home market sales not covered by split-pricing agreements by adding the metal discount and early payment discount to each home market sale.

Comment 13: Petitioner argues that the Department should not have accepted the Wieland Group's home market commission claim. According to petitioner, the Wieland Group failed to state whether the actual amount of the commission varied from product to product. Petitioner further asserts that the Wieland Group did not offer an explanation as to whether or how the commission varied from customer to customer, nor has the Wieland Group properly explained the terms and conditions of its home market commission claim. Petitioner contends that because respondent has not documented that it paid commissions on sales of such or similar merchandise, the Department should reject this home market commission claim in its final analysis.

The respondent responds that petitioner erroneously states that commissions are not tied to sales of such or similar merchandise and that commissions are firmly tied to sales of such or similar merchandise.

Department's Position: According to the Wieland Group's response, the firm sells through unrelated agents who, in turn, each sell in certain assigned territories. Respondent claims that because commissions do not vary by product or customer within a territory, a commission will necessarily apply to the products under investigation if sold in an area in which the respondent uses unrelated agents. The commission is only deducted from home market sales of covered merchandise made in one of these "commission" areas. Therefore, the Department has accepted the Wieland Group's home market commission claim for purposes of the final results.

Comment 14: Petitioner asserts that respondent's reported early payment discount claim was based on its total home market sales of all products and not just on the discounts granted on the subject merchandise. Respondent reported that early payment discounts are not granted on split-pricing sales that feature separate billing for metal costs and fabrication costs. Thus, respondent does not grant early payment discounts for certain split-pricing sales and failed to segregate its reported early payment discount claim on either a sales-specific or customer-specific basis. Therefore, petitioner argues, the Department should reject this claim.

Department's Position: The Department generally makes an adjustment if discounts, granted pursuant to accurately and adequately described programs, are properly reported on a sale or customer-specific basis and are directly associated with the products or sales under consideration. Although the Department has the discretion to allow adjustments based on allocations rather than invoice-specific adjustments where the allocation methods were reasonable and consistent, we are disallowing this claim (See Department's Position, Comment 12).

Comment 15: Both respondent and petitioner alleged that the Department made certain clerical and calculation errors.

Department's Position: Based on our analysis of the comments received and the correction of certain inadvertent programming and clerical errors, we have changed the preliminary results.

Final Results of Review

As a result of our review of the comments received, we have determined that the following weighted-average margins exist for the period August 22, 1986, through February 29, 1988:

Manufacturer/exporter	Margin (Percent)
Wieland Group (Wieland-Werke AG) (Langenberg Kupfer-und Messingwerke GmbH KG) (Metallwerke Schwarzwald GmbH)	19.59
William Prym	19.59
Schwermetall Halbzeugwerke	*7.30

*No shipments during the period. Rate is from the LTFV investigation.

The Department will instruct the Customs Service to assess antidumping duties on all appropriate entries. Individual differences between U.S. price and foreign market value may vary from the percentages stated above. The Department will issue appraisement instructions directly to the Customs Service.

Furthermore, the following deposit requirements will be effective upon publication of these final results of this administrative review for all shipments of the subject merchandise from Germany entered, or withdrawn from warehouse, for consumption on or after the date of publication, as provided in section 751(a)(1) of the Tariff Act: (1) The cash deposit rate for any shipments of this merchandise manufactured or exported by manufacturers/exporters not covered by this review, but specifically covered in the final determination of sales at LTFV, will continue to be the rate published in that

final determination; (2) the cash deposit rate for William Prym, Schwermetall Halbzeugwerke, and the Wieland Group (Wieland-Werke AG, Langenberg Kupfer-und Messingwerke GmbH KG and Metallwerke Schwarzwald GmbH) will be 19.59 percent; and (3) the cash deposit rate for all other exporters/producers shall be 19.59 percent for shipment of the subject merchandise. These deposit requirements shall remain in effect until publication of the final results of the next administrative review.

We have determined that the cash deposit rate applies to all entries from the former German Democratic Republic entered or withdrawn from warehouse for consumption on or after October 3, 1990.

This administrative review and notice are in accordance with section 751(a)(1) of the Tariff Act (19 U.S.C. section 1675(a)(1)) and 19 CFR 353.22.

Dated: November 14, 1991.

Marjorie A. Chorlins,

Acting Assistant Secretary for Import Administration.

BILLING CODE 3510-DS-M

[A-614-801]

Preliminary Determination of Sales at Less Than Fair Value: Fresh Kiwifruit From New Zealand

AGENCY: Import Administration, International Trade Administration, Department of Commerce.

EFFECTIVE DATE: November 27, 1991.

FOR FURTHER INFORMATION CONTACT: Erik Warga, Office of Antidumping Investigations, Import Administration, International Trade Administration, U.S. Department of Commerce, 14th Street and Constitution Avenue, NW., Washington, DC 20230; telephone: (202) 377-8922.

PRELIMINARY DETERMINATION: We preliminarily determine that fresh kiwifruit from New Zealand is being, or is likely to be, sold in the United States at less than fair value, as provided in section 773 of the Tariff Act of 1930, as amended (the Act). The estimated margins are shown in the "Suspension of Liquidation" section of this notice..

Case History

Since the publication of our notice of initiation on June 14, 1991, (56 FR 20023), the following events have occurred.

On June 19, 1991, the U.S. International Trade Commission (ITC) issued an affirmative preliminary injury determination in this case (56 FR 28171).

On August 21, 1991, the Department of Commerce (the Department) determined that this investigation was extraordinarily complicated, and postponed the preliminary determination from October 1, 1991, until November 21, 1991, in accordance with section 733(c)(1) of the Act (56 FR 41507).

On July 1, 1991, the Department presented sections A, B, and C of its questionnaire to the New Zealand Kiwifruit Marketing Board (NZKMB). As the entity through which, by law, all New Zealand kiwifruit for export must pass, with the exception of kiwifruit destined for export to Australia, the NZKMB is the only respondent in this investigation.

We received the NZKMB's response to section A of the questionnaire on July 29, 1991; on August 19, 1991, we received responses to sections B & C. Based on these responses, we issued a deficiency questionnaire on October 2, 1991, to which the NZKMB responded on October 16, 1991.

In its petition filed March 25, 1991, petitioners alleged that the NZKMB was selling kiwifruit in the home market and third country markets at prices below the cost of production. After an analysis of petitioners' allegations, the Department initiated a cost of production (Cop) investigation (56 FR 20023). Accordingly, a COP (section D) questionnaire was issued to the NZKMB, including growers, on July 22, 1991. Responses were received form 19 of 20 growers on September 12, 1991. On October 11, 1991, a deficiency questionnaire was issued with respect to the section D responses. Responses were received on October 30, 1991, but seven of the 19 were not accompanied by company certifications, as required by 19 CFR 353.31(i)(l). The uncertified responses were returned to the respondent. We used the September 12, 1991, responses and the 12 certified October 30, 1991, responses which were received in a timely manner for purposes of this preliminary determination. We subsequently received complete deficiency responses from six of the remaining seven growers, through not in time for use in this preliminary determination. Those certified responses will be considered for our final determination.

In their petition filed March 25, 1991, petitioners alleged the existence of critical circumstances. The Department requested shipment information from respondents in its questionnaire issued July 1, 1991. See the "Critical Circumstances" section of this notice below.

Scope of the Investigation

The product covered by this investigation is fresh kiwifruit from New Zealand. Processed kiwifruit, including fruit jams, jellies, pastes, purees, mineral waters, or juices made from or containing kiwifruit, are not within the scope of this investigation.

Fresh kiwifruit is currently classifiable under subheading 0810.90.20.60 of the Harmonized Tariff Schedule (HTS). Although the HTS subheading is provided for convenience and customs purposes, or written description of the scope of this proceeding is dispositive.

Period of Investigation

The period of investigation (POI) is April 1, 1990, through March 31, 1991. The "standard" six-month POI defined under 19 CFR 353.42(b) did not fall entirely within the normal selling season, failed to capture the bulk of kiwifruit sales in the United States, and would have been represented disproportionately by sales of kiwifruit nearing the end of its useful commercial life. In order to gain a more accurate picture of NZKMB pricing practices in the normal course of trade, and to more adequately address possible seasonal price patterns and questions of product perishability, the POI was extended to a one-year period encompassing a complete crop year an entire selling season.

Such or Similar Comparisons

We have determined that fresh kiwifruit constitutes one such or similar category of merchandise. The period of investigation was segmented according to the pricing periods utilized by respondent in the third country market (see "Market Viability" section of this notice below). Product comparisons within each pricing period were made according to count size (the number of kiwifruit contained on a single tray of a standard weight), and, when possible, pack form. In instances where we were able to make comparisons by count size but not by pack form, kiwifruit of identical count sizes were compared without regard to pack form. Because cost differences between trays of different count sizes are not quantifiable, and because other methods of calculating differences in merchandise were deemed inappropriate, we made no adjustments for differences in the physical characteristics of the merchandise; therefore, when there were no sales of merchandise of identical count size in the third country during a given pricing

period, the U.S. sale was not considered in our analysis.

Fair Value Comparisons

To determine whether sales of fresh kiwifruit from New Zealand to the United States were made at less than fair value, we compared the United States price to the foreign market value (FMV), as specified in the "United States Price" and "Foreign Market Value" sections of this notice.

United States Price

We based United States price on exporter's sales price (ESP), in accordance with section 772(c) of the Act, because virtually all sales to unrelated parties occurred after importation into the United States. We omitted from our analysis the purchase price sales (those made to unrelated parties prior to importation into the United States) because these sales constituted an extremely small percentage of total sales volume. Their inclusion would have had no meaningful impact on the calculation of estimated dumping margins.

We calculated ESP based on packed F.O.B. (ex-New Zealand coolstore), and packed F.O.B., freight prepaid prices. We made deductions, where appropriate, for New Zealand inland freight (coolstore to port), loading charges in New Zealand, ocean freight, basic marine insurance, charter insurance, U.S. import duties, U.S. brokerage and handling, U.S. inland freight (decreased to account for prepaid freight where applicable), and price discounts (*i.e.*,) advertising allowances, special advertising allowances, market adjustment discounts, advertising rebates which actually constituted discounts, and discounts for quality problems). In accordance with section 772(e)(1) and (2) of the Act, we made additional deductions, where appropriate, for agent commissions, broker commissions, credit, direct advertising, and indirect selling expenses. Indirect selling expenses included inventory carrying costs, repacking, U.S. primary and U.S. satellite coolstore charges, New Zealand and U.S. instore insurance, fire insurance, product liability and tamper insurance, earthquake insurance, indirect advertising, quality control expenses, miscellaneous selling-agent-related charges, U.S. incurred indirect expenses, and New Zealand incurred indirect selling expenses associated with selling in the United States. We increased the U.S. price to account for post sale price adjustments not reflected in the gross price.

Foreign Market Value

Market Viability

In order to determine whether there were sufficient sales of fresh kiwifruit in the home market to serve as a viable basis for calculating FMV, we compared the volume of home market sales of fresh kiwifruit to the volume of third country sales of fresh kiwifruit in accordance with section 773(a)(1) of the Act. We found that the home market was not viable for sales of fresh kiwifruit.

In selecting which third country market to use for comparison purposes, we first determined which third country markets had "adequate" sales volumes, within the meaning of 19 CFR 353.49(b)(1). We determined that the volume of sales to a third country market was adequate if the sales of such or similar merchandise exceeded, or was equal to, five percent of the volume sold to the United States.

In selecting which third country market of those having an adequate sales volume was the most appropriate for comparison purposes, we selected Japan, in accordance with CFR 353.49(b). In determining the most appropriate third country market for calculating foreign market value, we evaluated fruit age, count size, distribution systems, and market organization.

With respect to the criteria listed above, we did not find significant differences between the United States and Japan. Therefore, we have determined that Japan, the largest single third-country market is the appropriate third country market to be used for calculating foreign market value. Memorandum to Francis J. Sailer dated August 9, 1991.

Cost of Production

Petitioners alleged that respondent's home market and third country sales of fresh kikifruit were made at prices below COP. Since there are approximately 4,000 kiwifruit growers in New Zealand, the Department determined that sampling was necessary and appropriate to arrive at a representative cost for purposes of our analysis. Based on comments received from petitioner and respondent, we determined that the most significant factors influencing the cost of producing kiwifruit are farm location and farm size. We therefore stratified our sample into eight classifications using two regions and four size ranges. We chose farms from within the Bay-of-Plenty region, and elsewhere in New Zealand, and within the size ranges of less than two hectares, two to five hectares, five to 10 hectares, and greater than 10 hectares. All parties to the proceeding believe that the Bay-of-Plenty region has superior growing conditions compared to other regions of the country. COP questionnaires were issued through the NZKMB to 20 kiwifruit growers. Nineteen kiwifruit growers responded to the Department's questionnaire. We analyzed the 19 questionnaire responses received, and those deficiency responses which were certified within the deadline for submission, and have used this information in reaching our preliminary determination.

For purposes of calculating the COP of kiwifruit we relied upon the 19 grower submissions where such information was appropriately quantified or valued.

For the one grower that did not respond to our questionnaire, we used petitioner's cost information as best information available (BIA).

For grower number three, we calculated per unit costs based on the actual production quantity, rather than expected quantity.

For grower number nine, we allowed the offset of interest income against interest expense only to the extent of interest expense.

Grower number 17 stated that the cost of a full-time manager was reported in direct labor costs, however, no amount for labor was included in the COP. Therefore, we included the average cost for a full-time manager as submitted by the NZKMB.

Because grower number 18 reported no direct labor for its kiwifruit operations, we included the average direct labor cost per tray of all growers as BIA.

Since complete information regarding kiwifruit start-up costs was not provided by the growers, we used petitioner's information as BIA to value the start-up costs. We adjusted the farms' reported number of trays sold by the percentage fruit loss of 13 percent, which was disclosed by the NZKMB in its financial statement. Each farm's total costs were then allocated over the adjusted quantity sold to determine the cost per tray.

Individual grower costs were simple-average within each classification. These costs included the cost of materials, farm labor, farm overhead, and packing. A weighting factor was calculated for each classification based upon New Zealand production statistics regarding farm output by size and location. The simple-average grower costs by classification was multiplied by this weighting factor to arrive at the overall weighted-average farm cost per tray. We added the NZKMB's cool storage and selling, general and

administrative expenses to the weighted average farm cost per tray. We did not include the NZKMB's other expenses in the calculation of selling, general and administrative expenses (SG&A) as it was primarily comprised of foreign exchange losses. The total cost of production was calculated on a New Zealand dollar per single-layer tray equivalent basis (NZ$/SLT).

We compared third country weighted-average prices within each selling period (see FMV section below) to the calculated COP. We did not make adjustments to the cost of production based on the fruit size because we have preliminarily determined that there are no quantifiable cost differences associated with production of different fruit sizes.

Since over 90 percent of the NZKMB's sales were at prices above the total COP of fresh kiwifruit, we did not disregard any below-cost sales since the respondent's below-cost sales were not made in substantial quantities.

Foreign Market Value

We calculated FMV based on C&F prices to unrelated customers in Japan. We made deductions, where appropriate, for rebates, New Zealand inland freight, New Zealand inland freight insurance, New Zealand port loading expenses, ocean freight and charter insurance. Direct advertising, imputed credit, and letter of credit charges were also deducted. Where appropriate, we deducted third country packing costs and added U.S. packing costs. We rejected the NZKMB's reported packing figures because they represented an estimate of the cost to the packhouses of packing, not the cost to growers. We instead based packing on an average of packing costs reported by growers in their COP responses. We also deducted indirect selling expenses including inventory carrying costs, New Zealand instore and fire insurance, product liability and tamper insurance, indirect advertising, and other indirect selling expenses. This deduction for third country indirect selling expenses was capped by the amount represented by U.S. indirect selling expenses plus U.S. commissions, in accordance with 19 CFR 353.56(b).

Date of Sale

Respondent reported the date of sale as the first date of the pricing period during which each sale was made. However, at the beginning of a pricing period, only price had been determined; quantities assigned to each importer for a given shipment changed even after the date of departure. The invoice is the first written document in which both price and quantity sold to each importer in Japan for a given shipment are indicated. Since it is the Department's practice to assign the date of sale to the date of the earliest written evidence that firmly establishes the material terms of sale (price and quantity) (see Antifriction Bearings (Other Than Tapered Roller Bearings) From the Federal Republic of Germany, France, Italy, Japan, Romania, Singapore, Sweden, Thailand and the United Kingdom, 54 FR 18992, May 3, 1989), we elected to use the invoice date as the date of sale.

Critical Circumstances

Petitioners allege that "critical circumstances" exist with respect to imports of fresh kiwifruit from New Zealand. Section 733(e)(1) of the Act provides that critical circumstances exist when we determine that there is a reasonable basis to believe or suspect the following:

(1) That there is a history of dumping of the same class or kind of merchandise, or that the person by whom, or for whose account, the merchandise was imported knew or should have known that the exporter was selling the merchandise at less than fair market value, and

(2) That there have been massive imports of the subject merchandise over a relatively short period.

To determine whether imports have been massive over a relatively short period, we based our analysis on respondents' shipment data for equal periods immediately preceding and following the filing of the petition. Based on this analysis, we find that imports of the subject merchandise from New Zealand during the period subsequent to receipt of the petition did increase significantly. However, this increase in imports is a cyclical occurrence due to the seasonal nature of the subject merchandise. Therefore, after considering seasonal trends pursuant to 19 CFR 353.16(f)(ii), we do not find that there have been massive imports of the subject merchandise.

Since we do not find that there have been massive imports, we need not consider whether there is a history of dumping or whether importers of this merchandise knew or should have known that such merchandise was being sold at less than fair value. Therefore, we find that there is no reasonable basis to believe or suspect that critical circumstances exist with respect to imports of fresh kiwifruit from New Zealand.

Currency Conversion

When calculating foreign market value, we made currency conversions in accordance with 19 CFR 353.60 by using the exchange rates certified by the Federal Reserve Bank of New York.

Verification

As provided in section 776(b) of the Act, we will verify the information used in making our final determination.

Suspension of Liquidation

In accordance with section 733(d)(1) of the Act, we are directing the Customs Service to suspend liquidation of all entries of fresh kiwifruit from New Zealand, that are entered, or withdrawn from warehouse, for consumption on or after the date of publication of this notice in the **Federal Register**. The Customs Service shall require a cash deposit or posting of a bond equal to the estimated preliminary dumping margins, as shown below. This suspension of liquidation will remain in effect until further notice.

Producer/ manufacturer/ exporter	Weighted-average margin percentage	Critical circumstances
NZKMB	78.38	No
All Others	78.38	No

ITC Notification

In accordance with section 733(f) of the Act, we have notified the ITC of our determination. If our final determination is affirmative, the ITC will determine whether these imports are materially injuring, or threaten material injury to, the U.S. industry before the later of 120 days after the date of this preliminary determination or 45 days after our final determination.

Public Comment

In accordance with 19 CFR 353.38, case briefs or other written comments in at least ten copies must be submitted to the Assistant Secretary for Import Administration no later than January 10, 1992, and rebuttal briefs no later than January 15, 1992. In accordance with 19 CFR 353.38(b), we will hold a public hearing, if requested, to afford interested parties an opportunity to comment on arguments raised in case or rebuttal briefs. Tentatively, the hearing will be held on January 20, 1992, at 10 a.m. at the U.S. Department of Commerce, room 3708, 14th Street and Constitution Avenue, NW., Washington, DC 20230. Parties should confirm by telephone the time, date, and place of the hearing 48 hours before the scheduled time.

Interested parties who wish to request a hearing must submit a written request to the Assistant Secretary for Import

Administration, U.S. Department of Commerce, room B–099, within ten days of the publication of this notice. Requests should contain: (1) The party's name, address, and telephone number; (2) the number of participants; and (3) a list of the issues to be discussed. In accordance with 19 CFR 353.38(b), oral presentations will be limited to issues raised in the briefs.

This determination is published pursuant to section 733(f) of the Act and 19 CFR 353.15.

Dated: November 21, 1991.

Eric I. Garfinkel,

Assistant Secretary for Import Administration.

Export Trade Certificate of Review

ACTION: Notice of application for an amendment to an Export Trade Certificate of Review.

SUMMARY: The Office of Export Trading Company Affairs (OETCA), International Trade Administration, Department of Commerce, has received an application for an amendment to an Export Trade Certificate of Review. This notice summarizes the amendment and requests comments relevant to whether the Certificate should be amended.

FOR FURTHER INFORMATION CONTACT: George Muller, Director, Office of Export Trading Company Affairs, International Trade Administration, 202/377–5131. This is not a toll-free number.

SUPPLEMENTARY INFORMATION: Title III of the Export Trading Company Act of 1982 (15 U.S.C. 4001–21) authorizes the Secretary of Commerce to issue Export Trade Certificates of Review. A Certificate of Review protects the holder and the members identified in the Certificate from State and federal government antitrust actions and from private, treble damage antitrust actions for the export conduct specified in the Certificate and carried out in compliance with its terms and conditions. Section 302(b)(1) of the Act and 15 CFR 325.7, 325.6(a) require the Secretary to publish a notice in the **Federal Reigster** identifying the applicant and summarizing its proposed export conduct.

Request for Public Comments

Interested parties may submit written comments relevant to the determination of whether the Certificate should be amended. An original and five (5) copies should be submitted no later than 20 days after the date of this notice to: Office of Export Trading Company Affairs, International Trade Administration, Department of Commerce, room 1800H, Washington, DC 20230. Information submitted by any person is exempt from disclosure under the Freedom of Information Act (5 U.S.C. 552). Comments should refer to this application as "Export Trade Certificate of Review, application number 83–2A028."

OETCA has received the following application for an amendment to Export Trade Certificate of Review No. 83–00028, which was issued on April 13, 1984 (49 FR 15596, April 19, 1984).

Summary of the Application

Applicant: Carpenter Body Works, Inc., 1500 West Main Street, Mitchell, Indiana 47446.

Contact: Thomas R. Haley III, Attorney, Telephone: (317) 636–8000.

Application No.: 83–2A028.

Date Deemed Submitted: November 21, 1991.

Request For Amended Conduct: Carpenter Body Works, Inc. seeks to change the name of its current Export Trade Certificate of Review from "Carpenter Body Works, Inc." to "Carpenter Manufacturing, Inc." The Export Trade, Export Trade Facilitation Services, Export Markets, Export Trade Activities, and Methods of Operation covered by the certificate of review are unchanged.

Dated: November 21, 1991.

George Muller,

Director, Office of Export Trading Company Affairs.

[FR Doc. 91–28528 Filed 11–26–91; 8:45 am]

BILLING CODE 3510–DR–M

Export Trade Certificate of Review

AGENCY: International Trade Administration, Commerce.

ACTION: Notice of initiation of process to revoke Export Trade Certificate of Review No. 84–00013.

SUMMARY: The Department of Commerce had issued an export trade certificate of review to Equinomics, Inc. Because this certificate holder has failed to file an annual report as required by law, the Department is initiating proceedings to revoke the certificate. This notice summarizes the notification letter sent to Equinomics, Inc.

FOR FURTHER INFORMATION CONTACT: George Muller, Director, Office of Export Trading Company Affairs, International Trade Administration 202/377–5131. This is not a toll-free number.

SUPPLEMENTARY INFORMATION: Title III of the Export Trading Company Act of 1982 ("the Act") (15 U.S.C. 4011–21) authorized the Secretary of Commerce to issue export trade certificates of review. The regulations implementing title III ("the Regulations") are found at 15 CFR part 325. Pursuant to this authority, a certificate of review was issued on June 25, 1984 to Equinomics, Inc.

A certificate holder is required by law (section 308 of the Act, 15 U.S.C. 4018) to submit to the Department of Commerce annual reports that update financial and other information relating to business activities covered by its certificate. The annual report is due within 45 days after the anniversary date of the issuance of the certificate of review (§ 325.14 (a) and (b) of the Regulations). Failure to submit a complete annual report may be the basis for revocation (§§ 325.10(a) and 325.14(c) of the Regulations).

The Department of Commerce sent to Equinomics, Inc. on July 17, 1991, a letter containing annual report questions with a reminder that its annual report was due on August 9, 1991. Additional reminders were sent on August 22, 1991 and on October 10, 1991. The Department has received no written response to any of these letters.

On November 19, 1991, and in accordance with § 325.10(c)[2] of the Regulations, a letter was sent by certified mail to notify Equinomics, Inc. that the Department was formally initiating the process to revoke its certificate. The letter stated that this action is being taken for the certificate holder's failure to file an annual report.

In accordance with § 325.10(c)(2) of the Regulations, each certificate holder has thirty days from the day after its receipt of the notification letter in which to respond. The certificate holder is deemed to have received this letter as of the date on which this notice is published in the **Federal Register**. For good cause shown, the Department of Commerce can, at its discretion, grant a thirty-day extension for a response.

If the certificate holder decides to respond, it must specifically address the Department's statement in the notification letter that it has failed to file an annual report. It should state in detail why the facts, conduct, or circumstances described in the notification letter are not true, or if they are, why they do not warrant revoking the certificate. If the certificate holder does not respond within the specified period, it will be considered an admission of the statements contained in the notification letter (§§ 325.10(c)[2] of the Regulations)

If the answer demonstrates that the material facts are in dispute, the Department of Commerce and the

Department of Justice shall, upon request, meet informally with the certificate holder. Either Department may require the certificate holder to provide the documents or information that are necessary to support its contentions (§ 325.10(c)[3] of the Regulations).

The Department shall publish a notice in the **Federal Register** of a revocation or modification or a decision not to revoke or modify (§ 325.10(c)[4] of the Regulations). If there is a determination to revoke a certificate, any person aggrieved by such final decision may appeal to an appropriate U.S. district court within 30 days from the date on which the Department's final determination is published in the **Federal Register**.

Authority: sections 325.10(c)(4) and 325.11 of the Regulations.

Dated: November 20, 1991.

George Muller,

Director, Office of Export Trading Company Affairs.

BILLING CODE 3510-DR-M

Minority Business Development Agency

Business Development Center Applications: Mayaguez Puerto Rico (Service Area)

AGENCY: Minority Business Development Agency, Commerce.

ACTION: Notice.

SUMMARY: In accordance with Executive Order 11625, the Minority Business Development Agency (MBDA) is soliciting competitive applications under its Minority Business Development Center (MBDC) program to operate an MBDC for approximately a 3-year period, subject to Agency priorities, recipient performance and the availability of funds. The cost of performance for the first Budget period (12 months) is estimated as $184,260 in Federal funds, and a minimum of $32,516 in non-Federal (cost sharing) contribution, from May 1, 1992 to April 30, 1993. Cost-sharing contributions, may be in the form of cash contributions, client fees, in-kind contributions or combinations thereof. The MBDC will operate in the Mayaguez, Puerto Rico SMSA geographic service area.

The funding instrument for the MBDC will be a cooperative agreement. Competition is open to individuals, non-profit and for-profit organizations, State and local governments, American Indian tribes and educational institutions.

The MBDC program is designed to provide business development services to the minority business community for the establishment and operation of viable minority businesses. To this end, MBDA funds organizations that can identify and coordinate public and private sector resources on behalf of minority individuals and firms; offer a full range of management and technical assistance; and serve as a conduit of information and assistance regarding minority business.

Applications will be evaluated initially by regional staff on the following criteria: The experience and capabilities of the firm and its staff in addressing the needs of the business community in general and, specifically, the special needs of minority businesses, individuals and organizations (50 points); the resources available to the firm in providing business development services (10 points); the firm's approach (techniques and methodologies) to performing the work requirements included in the application (20 points); and the firm's estimated cost for providing such assistance (20 points). An application must receive at least 70% of the points assigned to any one evaluation criteria category to be considered programmatically acceptable and responsive. The selection of an application for further processing by MBDA will be made by the Director based on a determination of the application most likely to further the purpose of the MBDC Program. The application will then be forwarded to the Department for final processing and approval, if appropriate. The Director will consider past performance of the applicant on previous Federal awards.

MBDCs shall be required to contribute at least 15% of the total project cost through non-Federal contributions. To assist them in this effort, MBDCs may charge client fees for management and technical assistance (M&TA) rendered. Based on a standard rate of $50 per hour, MBDCs will charge client fees at 20% of the total cost for firms with gross sales of $500,000 or less, and 35% of the total cost for firms with gross sales of over $500,000.

MBDCs performing satisfactorily may continue to operate after the initial competitive year for up to 2 additional budget periods. MBDCs with year-to-date "commendable" and "excellent" performance ratings may continue to be funded for up to 3 or 4 additional budget periods, respectively. Under no circumstances shall an MBDC be funded for more than 5 consecutive budget periods without competition. Periodic reviews culminating in year-to-date quantitative and qualitative evaluations will be conducted to determine if funding for the project should continue. Continued funding will be at the discretion of MBDA based on such factors as an MBDC's performance, the availability of funds and the Agency priorities.

Awards under this program shall be subject to all Federal and Departmental regulations, policies, and procedures applicable to Federal assistance awards.

In accordance with QMB Circular A-129, "Managing Federal Credit Programs," applicants who have an outstanding account receivable with the Federal Government may not be considered for funding until these debts have been paid or arrangements satisfactory to the Department of Commerce are made to pay the debt.

Applicants are subject to Governmentwide Debarment and Suspension (Nonprocurement) requirements as stated in 15 CFR part 26.

The departmental Grants Officer may terminate any grant/cooperative agreement in whole or in part at any time before the date of completion whenever it is determined that the MBDC has failed to comply with the conditions of the grant/cooperative agreement. Examples of some of the conditions which can cause termination are failure to meet cost-sharing requirements; unsatisfactory performance of MBDC work requirements; and reporting inaccurate or inflated claims of client assistance or client certification. Such inaccurate or inflated claims may be deemed illegal and punishable by law.

On November 18, 1988, Congress enacted the Drug-Free Workplace Act of 1988 (Pub. L. 100-690 title V subtitle D). The statute requires contractors and grantees of Federal agencies to certify that they will provide a drug-free workplace. Pursuant to these requirements, the applicable certification form must be completed by each applicant as a precondition for receiving Federal grant or cooperative agreement awards.

"Certification for Contracts, Grants, Loans, and Cooperative Agreements" and SF-LLL, the "Disclosure of Lobbying Activities" (if applicable) is required in accordance with Section 319 of Public Law 101-121, which generally prohibits

recipients of Federal contracts, grants, and loans from using legislative Branches of the Federal Government in connection with a specific contract, grant or loan.

CLOSING DATE: The closing date for application is December 30, 1991. Applications must be postmarked on or before December 30, 1991.

Proposals will be reviewed by the Washington Regional Office, mailing address for submission is:

ADDRESSES: Gina A. Sanchez, Regional Director, Washington Regional Office, Minority Business Development Agency, 14th & Constitution Ave. NW., room 6711, Washington DC 20230.

FOR FURTHER INFORMATION CONTACT: John F. Iglehart, Regional Director, New York Regional Office at (212) 264–3263.

SUPPLEMENTARY INFORMATION: Anticipated processing time of this award is 120 days. Executive Order 12372 "Intergovernmental Review of Federal Programs" is not applicable to this program. Questions concerning the preceding information, copies of application kits and applicable regulations can be obtained at the above New York address.

BILLING CODE 3510–21–M

National Oceanic and Atmospheric Administration

Marine Mammals

AGENCY: National Marine Fisheries Service.

ACTION: Application for scientific research permit (P70E).

Notice is hereby given that William A. Watkins, Ph.D., Woods Hole Oceanographic Institution, Woods Hole, MA 02543, has applied in due form for a permit to take marine mammals as authorized by the Marine Mammal Protection Act of 1972 (16 U.S.C. 1361–1407), the Regulations Governing the Taking and Importing of Marine Mammals (50 CFR part 216), the Endangered Species Act of 1973 (16 U.S.C. 1531–1544), and the regulations governing endangered fish and wildlife permits (50 CFR parts 217–222).

Species and Type of Take

The applicant requests a permit to harass up to 25 sperm whales (*Physeter catodon*) annually, over a five year period, in the course of tagging up to five animals each year with radio/satellite tags. Animals may be double tagged and, in some instances, individual whales may be repeatedly approached during maneuvering for tagging position or for re-tagging purposes. The objectives of the research are to: Provide unequivocal individual identification of whales in order to follow their distribution and movements, group association and movements, social activity, and acoustic activity; document individual dive profiles; and continue the development and testing of tagging systems.

Concurrent with the publication of this notice in the **Federal Register**, the Secretary of Commerce is forwarding copies of this application to the Marine Mammal Commission and the Committee of Scientific Advisors.

Written data or views, or requests for a public hearing on this application should be submitted to the Assistant Administrator for Fisheries, National Marine Fisheries Service, U.S. Department of Commerce, 1335 East-West Hwy., room 7324, Silver Spring, Maryland 20910, within 30 days of the publication of this notice. Those individuals requesting a hearing should set forth the specific reasons why a hearing on this particular application would be appropriate. The holding of such hearing is at the discretion of the Assistant Administrator for Fisheries.

All statements and opinions contained in this application are summaries of those of the Applicant and do not necessarily reflect the views of the National Marine Fisheries Service.

Documents submitted in connection with the above application are available for review by interested persons in the following offices:

By appointment: Office of Protected Resources, National Marine Fisheries Service, 1335 East-West Hwy., suite 7324, Silver Spring, Maryland 20910 (301/427–2289);

Director, Southeast Region, National Marine Fisheries Service, 9450 Koger Blvd., St. Petersburg, Florida 33702 (813/893–3141);

Director, Northeast Region, National Marine Fisheries Service, One Blackburn Drive, Gloucester, Massachusetts, 01930 (508/281–9200).

Dated: November 21, 1991.

Nancy Foster,

Director, Office of Protected Resources.

BILLING CODE 3510–22–M

COMMITTEE FOR THE IMPLEMENTATION OF TEXTILE AGREEMENTS

Announcement of Import Restraint Limits and Guaranteed Access Levels for Certain Cotton, Wool, Man-Made Fiber and Other Vegetable Fiber Textiles and Textile Products from Jamaica

November 21, 1991.

AGENCY: Committee for the Implementation of Textile Agreements (CITA).

ACTION: Issuing a directive to the Commissioner of Customs establishing limits and guaranteed access levels for the new agreement year.

EFFECTIVE DATE: January 1, 1992.

FOR FURTHER INFORMATION CONTACT: Naomi Freeman, International Trade Specialist, Office of Textiles and Apparel, U.S. Department of Commerce, (202) 377–4212. For information on the quota status of these limits, refer to the Quota Status Reports posted on the bulletin boards of each Customs port or call (202) 566–5810. For information on embargoes and quota re-openings, call (202) 377–3715.

SUPPLEMENTARY INFORMATION:

Authority: Executive Order 11651 of March 3, 1972, as amended; section 204 of the Agricultural Act of 1956, as amended (7 U.S.C. 1854).

The Bilateral Cotton, Wool, Man-Made Fiber and Other Vegetable Fiber Textile Agreement of August 27, 1986, as amended, between the Governments of the United States and Jamaica establishes limits and guaranteed access levels for the period beginning on January 1, 1992 and extending through December 31, 1992.

A copy of the agreement is available from the Textiles Division, Bureau of Economic and Business Affairs, U.S. Department of State, (202) 647–3889.

A description of the textile and apparel categories in terms of HTS numbers is available in the CORRELATION: Textile and Apparel Categories with the Harmonized Tariff Schedule of the United States (see **Federal Register** notice 55 FR 50756, published on December 10, 1990). Information regarding the 1992 CORRELATION will be published in the **Federal Register** at a later date.

Requirements for participation in the Special Access Program are available in **Federal Register** notices 51 FR 21208, published on June 11, 1986; 52 FR 6049, published on February 27, 1987; 52 FR 26057, published on July 10, 1987; and 54

FR 50425, published on December 6, 1989.

The letter to the Commissioner of Customs and the actions taken pursuant to it are not designed to implement all of the provisions of the bilateral agreement, but are designed to assist only in the implementation of certain of its provisions.

Auggie D. Tantillo,

Chairman, Committee for the Implementation of Textile Agreements.

Committee for the Implementation of Textile Agreements

November 21, 1991.

Commissioner of Customs,
Department of the Treasury, Washington, DC 20229.

Dear Commissioner: Under the terms of section 204 of the Agricultural Act of 1956, as amended (7 U.S.C. 1854), and the Arrangement Regarding International Trade in Textiles done at Geneva on December 20, 1973, as further extended on July 31, 1991; pursuant to the Bilateral Cotton, Wool, Man-Made Fiber and Other Vegetable Fiber Textile Agreement of August 27, 1986, as amended, between the Governments of the United States and Jamaica; and in accordance with the provisions of Executive Order 11651 of March 3, 1972, as amended, you are directed to prohibit, effective on January 1, 1992, entry into the United States for consumption and withdrawal from warehouse for consumption of cotton, wool, man-made fiber and other vegetable fiber textiles and textile products in the following categories, produced or manufactured in Jamaica and exported during the twelve-month period beginning on January 1, 1992 and extending through December 31, 1992, in excess of the following levels of restraint:

Category	Twelve-month restraint limit
331/631	350,000 dozen pairs.
336/636	118,000 dozen.
338/339/638/639	877,421 dozen.
340/640	410,305 dozen of which not more than 347,181 dozen shall be in shirts made from fabrics with two or more colors in the warp and/or the filling in Categories 340-Y/640-Y [1].
341/641	515,217 dozen.
342/642	175,000 dozen.
345/845	127,131 dozen.
347/348/647/648	947,066 dozen.
352/652	600,000 dozen.
445/446	49,397 dozen.
447	10,000 dozen.
632	100,000 dozen pairs.

[1] Category 340-Y: only HTS numbers 6205.20.2015, 6205.20.2020, 6205.20.2046, 6205.20.2059 and 6205.20.2060; Category 640-Y: only HTS numbers 6205.30.2010, 6205.30.2020, 6205.30.2050 and 6205.30.2060.

Imports charged to these category limits for the period January 1, 1991 through December 31, 1991 shall be charged against those levels of restraint to the extent of any unfilled balances. In the event the limits established for that period have been exhausted by previous entries, such goods shall be subject to the levels set forth in this directive.

The limits set forth above are subject to adjustment in the future according to the provisions of the current bilateral agreement between the Governments of the United States and Jamaica.

In accordance with the provisions of the Special Access Program, as set forth in 51 FR 21208 (June 11, 1986), 52 FR 26057 (July 10, 1987) and 54 FR 50425 (December 6, 1989), you are directed to establish guaranteed access levels for properly certified cotton, man-made fiber and other vegetable fiber textile products in the following categories which are assembled in Jamaica from fabric formed and cut in the United States and re-exported to the United States from Jamaica during the twelve-month period which begins on January 1, 1992 and extends through December 31, 1992.

Category	Guaranteed Access Level
331/631	1,320,000 dozen pairs.
336/636	125,000 dozen.
338/339/638/639	1,500,000 dozen.
340/640	300,000 dozen.
341/641	375,000 dozen.
342/642	200,000 dozen.
345/845	50,000 dozen.
347/348/647/648	2,000,000 dozen.
352/652	3,250,000 dozen.
447	30,000 dozen.
632	3,300,000 dozen pairs.

Any shipment for entry under the Special Access Program which is not accompanied by a valid and correct certification and Export Declaration in accordance with the provisions of the certification requirements established in the directive of February 19, 1987 shall be denied entry unless the Government of Jamaica authorizes the entry and any charges to the appropriate designated consultation levels or specific limits. Any shipment which is declared for entry under the Special Access Program but found not to qualify shall be denied entry into the United States.

In carrying out the above directions, the Commissioner of Customs should construe entry into the United States for consumption to include entry for consumption into the Commonwealth of Puerto Rico.

The Committee for the Implementation of Textile Agreements has determined that these actions fall within the foreign affairs exception of the rulemaking provisions of 5 U.S.C. 553(a)(1).

Sincerely,

Auggie D. Tantillo,

Chairman, Committee for the Implementation of Textile Agreements.

BILLING CODE 3510-DR-F

Adjustment of Import Limits for Certain Cotton, Wool, Man-Made Fiber, Silk Blend and Other Vegetable Fiber Textiles and Textile Products Produced or Manufactured in Korea

November 21, 1991.

AGENCY: Committee for the Implementation of Textile Agreements (CITA).

ACTION: Issuing a directive to the Commissioner of Customs adjusting limits.

EFFECTIVE DATE: November 27, 1991.

FOR FURTHER INFORMATION CONTACT: Ross Arnold, International Trade Specialist, Office of Textiles and Apparel, U.S. Department of Commerce, (202) 377-4212. For information on the quota status of these limits, refer to the Quota Status Reports posted on the bulletin boards of each Customs port or call (202) 343-6581. For information on embargoes and quota re-openings, call (202) 377-3715.

SUPPLEMENTARY INFORMATION:

Authority: Executive Order 11651 of March 3, 1972, as amended; section 204 of the Agricultural Act of 1956, as amended (7 U.S.C. 1854).

The current limits for certain categories are being adjusted, variously, for swing and carryforward.

A description of the textile and apparel categories in terms of HTS numbers is available in the CORRELATION: Textile and Apparel Categories with the Harmonized Tariff Schedule of the United States (see **Federal Register** notice 55 FR 50756, published on December 10, 1990). Also see 55 FR 50860, published on December 11, 1990.

The letter to the Commissioner of Customs and the actions taken pursuant to it are not designed to implement all of the provisions of the bilateral agreement, but are designed to assist only in the implementation of certain of its provisions.

Auggie D. Tantillo,

Chairman, Committee for the Implementation of Textile Agreements.

Committee for the Implementation of Textile Agreements

November 21, 1991.

Commissioner of Customs,
Department of the Treasury, Washington, DC 20229.

Dear Commissioner: This directive amends, but does not cancel, the directive issued to you on December 5, 1990, by the Chairman, Committee for the Implementation of Textile Agreements. That directive concerns imports of certain cotton, wool, man-made fiber, silk blend and other vegetable fiber textiles and textile products, produced or manufactured in

Korea and exported during the twelve-month period which began on January 1, 1991 and extends through December 31, 1991.

Effective on November 27, 1991, you are directed to amend the December 5, 1990 directive to adjust the limits for the following categories, as provided under the terms of the current bilateral textile agreement between the Governments of the United States and the Republic of Korea:

Category	Twelve-month limit [1]
Group I	
200, 201, 218-220, 222-229, 300-326, 360-363, 369-O [2], 400, 410, 414, 464-469, 600-607, 611-622, 624-629, 665-669 and 670-O [3], as a group.	389,154,480 square meters equivalent.
Sublevels in Group I	
200	410,367 kilograms.
201	1,488,240 kilograms.
410	3,840,525 square meters.
611	3,444,000 square meters.
613/614	5,586,250 square meters.
619/620	95,227,850 square meters.
625/626/627/628/629	14,261,576 square meters.
Group II	
237, 239, 330-354, 359, 431-448, 459, 630-654 and 659, as a group.	562,682,380 square meters equivalent.
Sublevels in Group II	
338/339	1,107,000 dozen.
340	628,940 dozen of which not more than 326,566 dozen shall be in Category 340-D [4].
342/642	186,337 dozen.
347/348	483,740 dozen.
435	35,165 dozen.
442	50,770 dozen.
444	53,800 numbers.
448	35,717 dozen.
459-W [5]	96,617 kilograms.
632	1,450,964 dozen pairs.
633/634/635	1,373,601 dozen of which not more than 153,459 dozen shall be in Category 633 and not more than 575,262 dozen shall be in Category 635.
636	263,019 dozen.
Sublevel in Group III	
835	30,174 dozen.
Group VI	
369-L/670-L/870 [6], as a group.	54,414,168 square meters.

[1] The limits have not been adjusted to account for any imports exported after December 31, 1990.

[2] Category 369-O: all HTS numbers except 4202.12.4000, 4202.12.8020, 4202.12.8060, 4202.92.1500, 4202.92.3015 and 4202.92.6000 (Category 369-L).

[3] Category 670-O: all HTS numbers except 4202.12.8030, 4202.12.8070, 4202.92.3020, 4202.92.3030 and 4202.92.9020 (Category 670).

[4] Category 340-D: only HTS numbers 6205.20.2015, 6205.20.2020, 6205.20.2025 and 6205.20.2030.

[5] Category 459-W: only HTS number 6505.90.4090.

[6] Category 870; 369-L: only HTS numbers 4202.12.4000, 4202.12.8020, 4202.12.8060, 4202.92.1500, 4202.92.3015 and 4202.92.6000; Category 670-L: only HTS numbers 4202.12.8030, 4202.12.8070, 4202.92.3020, 4202.92.3030 and 4202.92.9020.

The Committee for the Implementation of Textile Agreements has determined that these actions fall within the foreign affairs exception to the rulemaking provisions of 5 U.S.C. 553(a)(1).

Sincerely,

Auggie D. Tantillo,

Chairman, Committee for the Implementation of Textile Agreements.

[FR Doc. 91-28519 Filed 11-26-91; 8:45 am]

BILLING CODE 3510-DR-F

Adjustment and Amendment of Import Limits for Certain Cotton and Man-Made Fiber Textile Products Produced or Manufactured in Mexico

November 25, 1991.

AGENCY: Committee for the Implementation of Textile Agreements (CITA).

ACTION: Issuing a directive to the Commissioner of Customs adjusting and amending limits.

EFFECTIVE DATE: November 25, 1991.

FOR FURTHER INFORMATION CONTACT: Naomi Freeman, International Trade Specialist, Office of Textiles and Apparel, U.S. Department of Commerce, (202) 377-4212. For information on the quota status of these limits, refer to the Quota Status Reports posted on the bulletin boards of each Customs port or call (202) 535-9481. For information on embargoes and quota re-openings, call (202) 377-3715.

SUPPLEMENTARY INFORMATION:

Authority: Executive Order 11651 of March 3, 1972, as amended; section 204 of the Agricultural Act of 1956, as amended (7 U.S.C. 1854).

The Governments of the United States and the United Mexican States agreed to increase the current Normal Regime limits for certain categories. Also, the current limits for certain categories are being adjusted, variously, for carryforward, carryover, swing, special shift and special shift subtracted.

A description of the textile and apparel categories in terms of HTS numbers is available in the CORRELATION: Textile and Apparel Categories with the Harmonized Tariff Schedule of the United States (see **Federal Register** notice 55 FR 50756, published on December 10, 1990). Also see 55 FR 51755, published on December 17, 1990; and 56 FR 41830, published on August 23, 1991.

The letter to the Commissioner of Customs and the actions taken pursuant to it are not designed to implement all of the provisions of the bilateral agreement, but are designed to assist only in the implementation of certain of its provisions.

Auggie D. Tantillo,

Chairman, Committee for the Implementation of Textile Agreements.

Committee for the Implementation of Textile Agreements

November 25, 1991.

Commissioner of Customs,

Department of the Treasury, Washington, DC 20229.

Dear Commissioner: This directive amends, but does not cancel, the directives of December 11, 1990 and August 19, 1991, issued to you by the Chairman, Committee for the Implementation of Textile Agreements. Those directives concern imports of certain cotton, wool and man-made fiber textile products, produced or manufactured in the United Mexican States and exported during the period which began on January 1, 1991 and extends through December 31, 1991.

Effective on November 25, 1991, you are directed to adjust and amend the limits for the following categories, as provided under the terms of the current bilateral agreement between the Governments of the United States and the United Mexican States:

Category	Twelve-month restraint limit [1]
Sublevels in Group I	
313	21,500,000 square meters.
317	20,635,000 square meters.
611	2,350,185 square meters.
Levels not in a group	
347/348/647/648 (Special Regime).	4,500,000 dozen.
359-C/659-C [2] (Special Regime).	2,325,000 kilograms.
604-A [3]	2,298,505 kilograms.
604-O/607-O [4]	920,358 kilograms.
669-B [5]	800,629 kilograms.
Normal Regime Category	
347/348/647/648	925,000 dozen.
359-C/659-C (sublimit)	400,000 kilograms.

[1] The limits have not been adjusted to account for any imports exported after December 31, 1990.

BILLING CODE 3510-DR-F

Denial of Participation in the Special Access and Special Regime Programs

November 21, 1991.

AGENCY: Committee for the Implementation of Textile Agreements (CITA).

ACTION: Issuing a directive to the Commissioner of Customs denying the right to participate in the Special Access and Special Regime Programs.

EFFECTIVE DATE: January 1, 1992.

FOR FURTHER INFORMATION CONTACT: Lori E. Goldberg, International Trade Specialist, Office of Textiles and Apparel, U.S. Department of Commerce, (202) 377-3400.

SUPPLEMENTARY INFORMATION:

Authority: Executive Order 11651 of March 3, 1972, as amended; section 204 of the Agricultural Act of 1956, as amended (7 U.S.C. 1854).

The Committee for the Implementation of Textile Agreements (CITA) has determined that Apparel Service Works Corporation is in violation of the requirements set forth for participation in the Special Access and Special Regime Programs.

In the letter published below, the Chairman of CITA directs the Commissioner of Customs, effective on January 1, 1992, to deny Apparel Service Works Corporation the right to participate in the Special Access and Special Regime Programs, for a period of one year, beginning January 1, 1992 and ending December 31, 1992.

Requirements for participation in the Special Access Program are available in Federal Register notices 51 FR 21208, published on June 11, 1986; 52 FR 26057, published on July 10, 1987; and 54 FR 50425, published on December 6, 1989.

Requirements for participation in the Special Regime Program are available in **Federal Register** notices 53 FR 15724, published on May 3, 1988; 53 FR 32421, published on August 25, 1988; 53 FR 49346, published on December 7, 1988; and FR 50425, published on December 6, 1989.

Auggie D. Tantillo,

Chairman, Committee for the Implementation of Textile Agreements.

Committee for the Implementation of Textile Agreements

November 21, 1991.

Commissioner of Customs,

Department of the Treasury, Washington, DC 20229.

Dear Commissioner: The purpose of this directive is to notify you that the Committee for the Implementation of Textile Agreements has determined that Apparel Service Works Corporation is in violation of the requirements for participation in the Special Access and Special Regime Programs.

Effective on January 1, 1992, you are directed to prohibit Apparel Service Works Corporation from further participation in the Special Access and Special Regime Programs, for a period of one year, beginning January 1, 1992 and ending December 31, 1992. Goods accompanied by Form ITA-370P which are presented to U.S. Customs for entry under the Special Access and Special Regime Programs will no longer be accepted.

The Committee for the Implementation of Textile Agreements has determined that this action falls within the foreign affairs exception to the rulemaking provisions of 5 U.S.C. 553(a)(1).

Sincerely,

Auggie D. Tantillo,

Chairman, Committee for the Implementation of Textile Agreements.

BILLING CODE 3510–DR–F

DEPARTMENT OF DEFENSE

Department of the Army

Availability (NOA) of the Final Environmental Impact Statement (FEIS) for the Aerial Cable Test Capability (ACTC) Project To Be Located at White Sands Missile Range, NM

AGENCY: Department of the Army, DoD.

ACTION: Notice of availability.

SUMMARY: This announces the notice of availability of the final environmental impact statement (FEIS) on the potential impact of the development, integration, and operation of the proposed Aerial Cable Test Capability facility at White Sands Missile Range, New Mexico. The proposed ACTC facility will be used to test ground-to-air missiles against targets suspended from an aerial cable, and the aerial tramway will also be used for testing of other DoD materiel as an alternative to some of the testing requiring airborne target drones and manned aircraft. The FEIS examines the potential impacts of the development, integration, and operation of this ACTC facility at alternative sites within White Sands Missile Range and the "no-action" alternative. The "no-action" alternative is considered to be a continuation of present missile testing using airborne drone targets and manned aircraft delivery of DoD test materiel.

SUPPLEMENTARY INFORMATION: The Department of the Army published a Notice of Availability on August 21, 1991 (FR, No. 162, pp. 41530–41531) which provided notice that, pursuant to the National Environmental Policy Act and implementing regulations, it had prepared a Draft EIS for the Aerial Cable Test Capability project. Public hearings were held on 10 September 1991 at Socorro, New Mexico and on 11 September 1991 at Carrizozo, New Mexico to receive comments on this DEIS.

ADDITIONAL INFORMATION: The Environmental Protection Agency also will publish a Notice of Availability for the FEIS in the **Federal Register**. This FEIS will have a 30-day comment period from the date that the Environmental Protection Agency files a notice of availability in the **Federal Register**. Copies of this FEIS may be obtained by writing to the Commander, U.S. Army White Sands Missile Range, ATTN: STEWS–ID–DC (Mr. Henry B.

Stephenson, Jr.), White Sands Missile Range, New Mexico, 88002.

Lewis D. Walker,

Deputy Assistant Secretary of the Army, (Environment, Safety and Occupational Health), OASA (I, L&E).

BILLING CODE 3710-08-M

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Docket No. JD91-07917T Oklahoma-9]

State of Oklahoma; Amended NGPA Notice of Determination by Jurisdictional Agency Designating Tight Formation

November 19, 1991.

Take notice that on October 31, 1991, the Oklahoma Corporation Commission for the State of Oklahoma (Oklahoma) amended its previously filed notice of determination that the Atoka Formation, located in portion of Latimer and LeFlore Counties, Oklahoma, qualifies as a tight formation under section 107(b) of the Natural Gas Policy Act of 1978 (NGPA). Oklahoma's original notice of determination for the Atoka Formation under FERC No. JD91-07917T was submitted to the Commission on July 15, 1991. Notice of receipt of that determination was issued by the Commission on July 17, 1991.

The amended notice of determination reduces both the stratigraphic interval and the geographical area being designated by Oklahoma. The revised stratigraphic interval consists of that portion of the Atoka Formation which is situated below a depth of 4,000 feet (as measured from the surface), down to but excluding the Basal Atoka Spiro sandstone. The revised geographical area consists of: all of T5N, R21E and T5N, R22E; sections 1-18 in T4N, R21E and T4N, R22E; and sections 4-9, 16-21, and 28-33 in T5N, R23E, all located in Latimer and LeFlore Counties, Oklahoma. The amended notice of determination also contains Oklahoma's findings that the referenced portion of the Atoka Formation meets the requirements of the Commission's regulations set forth in 18 CFR part 271.

The application for determination is available for inspection, except for material which is confidential under 18 CFR 275.206, at the Federal Energy Regulatory Commission, 825 North Capitol Street, NE., Washington, DC 20426. Persons objecting to the determination may file a protest, in accordance with 18 CFR 275.203 and 275.204, within 20 days after the date this notice is issued by the Commission.

Lois D. Cashell,

Secretary.

BILLING CODE 6717-01-M

[Docket Nos. TQ92-1-20-001 & 002, TM92-3-20-001 and 002, TQ92-2-20-002 and 003, and RP90-22-016]

Algonquin Gas Transmission Co., Proposed Changes in FERC Gas Tariff

November 20, 1991.

Take notice that Algonquin Gas Transmission Company ("Algonquin") on November 15, 1991, tendered for filing proposed changes in its FERC Gas Tariff, Third Revised Volume No. 1, as set forth in the revised tariff sheets listed on Attachment A.

Algonquin states that these revised tariff sheets are being filed to comply with the Commission's Letter Order of October 31, 1991 in Docket Nos. TQ92-1-20-000 and TM92-3-20-000 ("October 31 Order"), which accepted the rate sheets filed in the above docket and directed Algonquin to refile within 15 days to track suppliers' rates in effect as of November 1, 1991.

Algonquin also states that this refiling causes the cumulative PGA in all subsequent filings to be changed in order to reflect the changes caused by the October 31 Order. These tariff sheets are also listed in Attachment A.

Algonquin further states that subsequent to Algonquin's filing of its regularly scheduled Quarterly PGA in Docket No. TQ92-2-20-000, CNG Transmission Corporation ("CNG") filed in Docket No. TQ92-3-22-000, et. al., primary and alternate versions of a tariff sheet that underlies Algonquin's sales schedules. In order to reflect this, Algonquin is filing primary and alternate sheets in Docket Nos. TQ92-2-20-001 and TM92-6-20-001 to track CNG's two versions.

If the Commission approves the primary rates filed in CNG's Docket No. TQ92-1-22-000, Algonquin proposes to place its primary tariff sheets into effect as of December 1, 1991. Otherwise, Algonquin proposes that the Commission place its alternate rate sheets into effect.

Algonquin also states that the Commission directed Algonquin to refile its 6 Rev Sheet No. 29 under Rate Schedule LFS to reflect the correct base rate and cumulative PGA adjustments. Therefore, Algonquin is filing a corrected tariff sheet for Rate Schedule LFS to be effective October 1, 1991 to reflect the revised base rate for the Cost or T & C by Others demand and commodity charges as approved for October 1, 1991 by the Commission in Docket Nos. RP90-22-000 and RP91-146-000, as well as revised tariff sheets for the following months.

Algonquin notes that copies of this filing were served upon each affected party and interested state commissions.

Any person desiring to protest said filing should file a protest with the Federal Energy Regulatory Commission, 825 North Capitol Street, NE., Washington, DC 20426, in accordance with rule 211 of the Commission's Rules of Practice and Procedure 18 CFR 385.211. All such protests should be filed on or before November 27, 1991. Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Copies of this filing are on file with the Commission and are available for public inspection.

Lois D. Cashell,

Secretary.

Meeting on December 16, 1991: Industrialized Countries/OECD Working Group of the Trade and Environment Committee of the National Advisory Council for Environmental Policy and Technology (NACEPT)

Under Public Law 92463 (The Federal Advisory Committee Act), EPA gives notice of the meeting of the Industrialized Countries/OECD Working Group of the Trade and Environment Committee is a standing committee of the National Advisory Council for Environmental Policy and Technology (NACEPT), an advisory committee to the Administrator of the EPA. The meeting will convene December 16, 1991 from 10 a.m. to 4 p.m. at the offices of Wilmer Cutler and Pickering, 2445 M Street, NW., 9th Floor Boardroom, Washington, DC 20037-1420.

The Industrialized Countries/OECD Group will explore the linkages between trade and environment, and especially how they relate to the Organization of Economic Cooperation and Development. The working group will suggest practicable policy approaches to these linkages in order to draw out a general policy framework for the United

States. For further information, please call (202) 260–3198.

Dated: November 20, 1991.

Abby J. Pirnie,

NACEPT Designated Federal Official.

[FRL–4035–8]

Open Meeting on December 17, 1991: Industrial Pollution Prevention Project Focus Group of the Technology Innovation and Economics Committee, National Advisory Council for Environmental Policy and Technology (NACEPT)

Under Public Law 92463 (The Federal Advisory Committee Act), EPA gives notice of a meeting of the Industrial Pollution Prevention Project Focus Group of the Technology Innovation and Economics (TIE) Committee. The TIE Committee is a standing committee of the National Advisory Council for Environmental Policy and Technology (NACEPT), an advisory committee to the Administrator of the EPA. The meeting will convene December 17, 1991, from 8:30 a.m. to 5 p.m. at the Madison Hotel, 1177 15th Street, NW., Washington, DC 20005.

The Industrial Pollution Prevention Project Focus Group is examining methods by which pollution prevention can be encouraged, particularly through effluent guidelines. The TIE Committee believes that among the most important barriers to the implementation of pollution prevention concepts and programs are disincentives inadvertently built into the standard setting process, including the effluent guidelines. The Focus Group is a mechanism involving industry, academia, environmental groups, all levels of government, and other interested parties in the incorporation of pollution prevention into EPA's Office of Water effluent guidelines process and in EPA's effort to spread the pollution prevention ethic.

The Focus Group is an "Ongoing Forum" for the Industrial Pollution Prevention Project (IPPP). The meeting will discuss comments on IPPP draft products, including:

- Incentives Study
- 301(k) Variance Study
- Retrospective Study
- International Study
- Workplan for the consumer education task

Further items for discussion will include how to broaden the scope of the effluent guidelines in order to incorporate broader pollution prevention considerations and at the same time reduce the time and cost of developing an effluent guideline.

The December 17 meeting will be open to the public. Written comments will be received and reviewed by the Focus Group. Additional information may be obtained from David R. Berg or Morris Altschuler at 401 M Street, SW (A–101–F6), Washington, DC 20460, by calling 202–260–9153, or by written request sent by fax at 202–260–6882 or by mail at the above address.

Dated: November 20, 1991.

Abby J. Pirnie,

NACEPT Designated Federal Official.

[OPP–66153; FRL 3942–3]

Receipt of Requests to Voluntarily Cancel Certain Pesticide Registrations

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice.

SUMMARY: In accordance with section 6(f)(1) of the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA), as amended, EPA is issuing a notice of receipt of requests by registrants to voluntarily cancel certain pesticide registrations.

DATES: Unless a request is withdrawn all cancellations will be effective February 25, 1992.

FOR FURTHER INFORMATION CONTACT: By mail: James A. Hollins, Office of Pesticide Programs (H7502C), Environmental Protection Agency, 401 M St., SW., Washington, DC 20460. Office location for commercial courier delivery and telephone number: Rm. 210, Crystal Mall # 2, 1921 Jefferson Davis Highway, Arlington, VA 22202, (703) 557–4461.

SUPPLEMENTARY INFORMATION:

I. Introduction

Section 6(f)(1) of the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA), as amended, provides that a pesticide registrant may, at any time, request that any of its pesticide registrations be cancelled. The Act further provides that EPA must publish a notice of receipt of any such request in the **Federal Register** before acting on the request.

II. Intent to Cancel

This Notice announces receipt by the Agency of requests to cancel some 20 pesticide products registered under section 3 or 24(c) of FIFRA. These registrations are listed in sequence by registration number (or company number and section 24(c) number) in the following Table 1:

TABLE 1.—REGISTRATIONS WITH PENDING REQUESTS FOR CANCELLATION

051036-00095	Diazinon 5 Dust	*O,O*-Diethyl *O*-(2-isopropyl-6-methyl-4-pyrimidinyl) phosphorothioate

Unless a request is withdrawn by the registrant within 90 days of publication of this notice, orders will be issued cancelling all of these registrations. Users of these pesticides or anyone else desiring the retention of a registration should contact the applicable registrant directly during this 90-day period. The following Table 2 includes the names and addresses of record for all registrants of the products in Table 1, in sequence by EPA Company Number.

TABLE 2.—REGISTRANTS REQUESTING VOLUNTARY CANCELLATION

EPA Company No.	Company Name and Address
000100	Ciba-Geigy Corp., Box 18300, Greensboro, NC 27419.
000400	Uniroyal Chemical Co Inc., 74 Amity Rd, Bethany, CT 06524.
000524	Monsanto Co., 700 14th Street, N.W. Suite 1100, Washington, DC 20005.
000602	Purina Mills, Inc., Box 66812, St Louis, MO 63166.
005481	Amvac Chemical Corp., 4100 E. Washington Blvd., Los Angeles, CA 90023.
005905	Helena Chemical Co, 5100 Popular Ave., Suite 3200, Memphis, TN 38137.
043410	Agri-Chem, Inc., Box 607477, Orlando, FL 32860.
050534	ISK Biotech Corp., 5966 Heisley Rd. Box 8000, Mentor, OH 44061.
051036	Micro-Flo Co., Box 5948, Lakeland, FL 33807.
958777	California Fig Institute, Fresno, California, CA 90063.

III. Procedures for Withdrawal of Request

Registrants who choose to withdraw a request for cancellation must submit such withdrawal in writing to James A. Hollins, at the address given above, postmarked before February 25, 1992. This written withdrawal of the request for cancellation will apply to the applicable section 6(f)(1) request listed in this notice. If the products have been subject to previous cancellation action, the effective date of cancellation and all other provisions of any earlier cancellation action are controlling. The withdrawal request must also include a commitment to pay any reregistration fees due, and to fulfill any applicable unsatisfied data requirements.

IV. Provisions for Disposition of Existing Stocks

The effective date of cancellation will be the date of the cancellation order. The orders effecting these requested cancellations will generallly permit registrants to continue to sell and distribute existing stocks of the cancelled products for one year after the date of this notice. Existing stocks are those stocks of registered pesticide products which are currently in the United States and which have been packaged, labeled, and released for shipment prior to the effective date of the cancellation action. Unless the provisions of an earlier order apply, existing stocks already in the hands of dealers or users can be distributed, sold or used legally until they are exhausted, provided that such further sale and use comply with the EPA-approved label and labeling of the affected product(s). Exceptions to these general rules will be made in specific cases when more stringent restrictions on sale, distribution, or use of the products or their ingredients have already been imposed, as in Special Review actions, or where the Agency has identified significant potential risk concerns associated with a particular chemical.

Dated: October 28, 1991.

Susan H. Wayland,

Acting Director, Office of Pesticide Programs.

BILLING CODE 6560-50-F

[OPP-180855; FRL 4003-7]

Emergency Exemption for the use of Maneb; Solicitation of Public Comment

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice.

SUMMARY: EPA has granted specific exemptions to the Florida Department of Agriculture and Consumer Services (hereafter referred to as the "Applicant") to use the fungicide maneb (CAS 12427-38-2) to treat 17,325 acres of peppers to control bacterial spot (*Xanthomonas campestris* pv. *vesicatoria*) and to treat 7,950 acres of lettuce (both head and leaf) to control downy mildew (*Bremia lactucae*). These exemptions authorized the use of maneb from October 29, 1991, to June 30, 1992. Both the incoming request and the Action Memorandum granting the request are available for public review at the address below for the Public Docket and Freedom of Information Section.

The specific exemptions are for the use of a chemical which is the subject of a Special Review. Normally, in accordance with 40 CFR 166.24, EPA would solicit public comment before making the decision whether or not to grant the exemption. However, in this instance the Agency inadvertently failed

to do so. Although, EPA has already authorized the use of maneb in Florida, due to the 8 -month duration of the exemption, the Agency is soliciting public comment on whether or not the use of maneb should be allowed to continue in Florida.

DATES: Comments must be received on or before December 12, 1991.

ADDRESSES: Three copies of written comments, bearing the identification notation "OPP–180855," should be submitted by mail to: Public Docket and Freedom of Information Section, Field Operations Division (H7506C), Office of Pesticide Programs, Environmental Protection Agency, 401 M St., SW., Washington, DC 20460. In person, bring comments to: Rm. 1128, Crystal Mall #2, 1921 Jefferson Davis Highway, Arlington, VA.

Information submitted in any comment concerning this notice may be claimed confidential by marking any part or all of that information as "Confidential Business Information." Information so marked will not be disclosed except in accordance with procedures set forth in 40 CFR part 2. A copy of the comment that does not contain Confidential Business Information must be provided by the submitter for inclusion in the public record. Information not marked confidential may be disclosed publicly by EPA without prior notice. All written comments filed pursuant to this notice will be available for public inspection in rm. 1128, Crystal Mall #2, 1921 Jefferson Davis Highway, Arlington, VA, from 8 a.m. to 4 p.m., Monday through Friday, except legal holidays.

FOR FURTHER INFORMATION CONTACT: By mail: Jim Tompkins, Registration Division (H7505C), Office of Pesticide Programs, Environmental Protection Agency, 401 M St., SW., Washington, DC 20460, Office location and telephone number: Rm. 716, Crystal Mall #2, 1921 Jefferson Davis Highway, Arlington, VA, (703–557–4359).

SUPPLEMENTARY INFORMATION: Pursuant to section 18 of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) (7 U.S.C. 136p), the Administrator may, at his discretion, exempt a State agency from any registration provision of FIFRA if he determines that emergency conditions exist which require such exemption.

The Applicant requested the Administrator to issue a specific exemption for the use of four registered maneb products on peppers to control bacterial spot and on lettuce to control downy mildew. Information in accordance with 40 CFR part 166 was submitted as part of this request.

On December 20, 1989, the EPA published in the **Federal Register** "Ethylene Bisdithiocarbamate; Notice of Preliminary Determination to Cancel Certain Registrations, Notice of Technical Support Document and Draft Notice of Intent to Cancel". EPA reviewed the registered EBDC fungicides (maneb, mancozeb, metiram, nabam, and zineb) and concluded that the risks from continued use of EBDCs outweighed the benefits. The EBDCs pose carcinogenic risks to consumers from dietary exposure and risks of carcinogenic, developmental and thyroid effects to mixers, loaders, and applicators of these pesticides. Prior to the notice, the four major registrants of the EBDC fungicides voluntarily withdrew 42 of the 55 food use registrations, including peppers and lettuce. As a result of the voluntary withdrawal, after January 1, 1990, growers were only able to purchase EBDC fungicides labeled for 13 crops: almonds, bananas, potatoes, sugar beets, sweet corn, asparagus, cranberries, figs, grapes, onions, peanuts, tomatoes, and wheat. Since December 31, 1989, growers have been using existing stocks of labeled materials purchased prior to December 1989 to obtain adequate control of bacterial spot on peppers and downy mildew on lettuce. These stocks have been depleted leaving growers with no means of controlling bacterial spot or downy mildew for the 1991–1992 season.

Since the voluntary action, both the registrants and the affected commodity groups have obtained and submitted additional information to the EPA. According to the Applicant, data generated through the Market Basket Survey by the EBDC/ETU Task Force and submitted to the EPA as part of the Special Review clearly indicates an acceptable level of carcinogenic dietary risk for these uses. It is the Applicant's opinion that when EPA completes the EBDC Special Review peppers and lettuce will be among the crops identified as appropriate crops to be put back onto the EBDC labels.

Growers who plan to plant a fall crop of peppers or lettuce do not have an effective means of preventing epidemic disease outbreaks of bacterial spot or downy mildew. The only way Florida growers can adequately manage this situation is to be allowed to use Maneb under an emergency exemption until a final decision is reached about future uses of EBDC fungicides.

Bacterial spot is the most serious pepper disease in Florida. It affects stems, leaves, and fruit. Yields may be indirectly affected as a result of defoliation or directly affected because of disease on the fruit itself. Because bacterial spot is so difficult to control, it is one of the major yield limiting pepper pests.

Downy mildew is a disease of lettuce found throughout the lettuce production areas in the United States. Up until the early eighties, downy mildew was controlled through the use of resistant varieties. In 1980, varieties that were previously tolerant began to exhibit symptoms of the disease. In 1983, metalaxyl was registered for use on head lettuce. Subsequently, strains of metalaxyl resistant downy mildew developed in California. Florida did not have a problem with metalaxyl resistant strains of downy mildew until 1989. The Florida resistant strain is identical to the California strain and is suspected to have come from California on infected plant material.

The Agency granted the specific exemptions for the use of maneb because an emergency situation appeared to exist in that the registered alternatives do not provide adequate control of the pest under the current conditions and that in the absence of EBDC's, Florida pepper and lettuce growers could be expected to incur yield losses that would lead to a significant economic loss. The voluntary withdrawal of the use of maneb on peppers and lettuce combined with the depletion of the existing stocks of labeled material purchased prior to December 1989, has left growers with no effective means of control. This lack of an effective means of control is expected to cause pepper and lettuce growers in Florida to suffer significant yield losses.

The carcinogenic risk estimates and margin of exposure for developmental toxicity and for thyroid effects for a single year's use under an emergency exemption indicate that the proposed use is not anticipated to pose an unreasonable risk to the public health. The proposed use is not expected to pose an unreasonable risk to the environment.

Maneb will be applied at the maximum rate of 1.6 lbs. active ingredient per acre with a maximum of 8 applications on 17,325 acres of peppers. This amounts to 221,760 pounds of active ingredient. A 7-day pre-harvest interval will be observed. On lettuce, maneb will be applied at the maximum rate of 1.6 lbs. active ingredient per acre with a maximum of 6 applications on 7,950 acres of lettuce. This amounts to 76,320 pounds of active ingredient. A 7-day pre-harvest interval will be observed. This is the first year that the Applicant has applied for specific

exemptions for the use of maneb on peppers and lettuce.

Although EPA has already authorized the use of maneb in Florida, due to the 8-month duration of the exemption the Agency is soliciting public comment on whether or not the use of maneb should be allowed to continue in Florida. Accordingly, interested persons may submit written views on this subject to the Field Operations Division at the address above.

Dated: November 8, 1991.

Anne E. Lindsay,

Director, Registration Division, Office of Pesticide Programs.

Shoshone-Bannock Tribes, Notice of Approval of Shoshone-Bannock Tribal Certification Plan

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice of approval of Tribal Plan.

SUMMARY: In the **Federal Register** of May 29, 1991, EPA announced its intent to approve the Shoshone-Bannock Tribes' Plan for Certification of Applicators of Pesticides Classified for Restricted Use. EPA hereby announces final approval of this Tribal Plan.

ADDRESSES: Copies of the Shoshone-Bannock Tribal Plan are available for review at the following locations during normal business hours.

1. Shoshone-Bannock Tribes Land Use Department, P. O. Box 306, Fort Hall, ID 83203, Telephone: (208) 238-3860.
2. Pesticides and Toxic Substances Branch, Air and Toxics Division, Region X, Environmental Protection Agency, 1200 Sixth Avenue, Seattle, WA 98101, Telephone: (206) 553-1980.
3. Field Operations Division (H7506C), Office of Pesticide Programs, Rm. 1128, CM #2, 1921 Jefferson Davis Highway, Arlington, VA 22202, Telephone: (703) 305-5805.

FOR FURTHER INFORMATION CONTACT: Allan Welch, Pesticides and Toxic Substances Branch (AT-083), Region X, Environmental Protection Agency, 1200 Sixth Avenue, Seattle, WA 98101, Telephone: (206) 553-1980.

SUPPLEMENTARY INFORMATION: In the **Federal Register** of May 29, 1991 (56 FR 24188), EPA announced its intent to approve the Shoshone-Bannock Tribes' Plan for the Certification of Applicators of Pesticides Classified for Restricted Use. Interested persons were given 30 days to comment. No comments were received.

EPA therefore grants final approval of the Shoshone-Bannock Tribal Plan for Certification of Applicators of Pesticides Classified for Restricted Use.

Dated: October 4, 1991.

Dana A. Rasmussen,

Regional Administrator, Region X.

FEDERAL COMMUNICATIONS COMMISSION

Public Information Collection Requirements Submitted to Office of Management and Budget for Review

November 20, 1991.

The Federal Communications Commission has submitted the following information collection requirements to OMB for review and clearance under the Paperwork Reduction Act of 1980 (44 U.S.C. 3507).

Copies of these submissions may be purchased from the Commission's copy contractor, Downtown Copy Center, 1114 21st Street, NW., Washington, DC 20036, (202) 452-1422. For further information on these submissions contact Judy Boley, Federal Communications Commission, (202) 632-7513. Persons wishing to comment on these information collections should contact Jonas Neihardt, Office of Management and Budget, room 3235 NEOB, Washington, DC 20503, (202) 395-4814.

OMB number: 3060-0349.

Title: Sections 76.73 and 76.75, Cable TV EEO Policy and Programs.

Action: Extension.

Respondents: Businesses or other for-profit (including small businesses).

Frequency of response: Recordkeeping requirement.

Estimated annual burden: 5,575 recordkeepers; 25.36 hours average burden per recordkeeper; 141,382 hours total annual burden.

Needs and uses: Section 76.73 provides that equal opportunity in employment shall be afforded by all cable entities to all qualified persons and no person shall be discriminated against in employment by such entities because of race, color, religion, national origin, age or sex. Sections 76.73 and 76.75 require that each cable employment unit shall establish, maintain and carry out a program to assure equal opportunity in every aspect of a cable entity's policy and practice. The data is used by cable entities in the preparation of the Cable Television Annual Employment Report (FCC Form 395-A). The data is also used by FCC staff, in field investigations involving equal employment opportunity. If this program was not maintained there could be no assurance that efforts are being made to afford equal opportunity in employment.

OMB number: 3060-0348.

Title: Section 76.79, Records available for public inspection.

Action: Extension.

Respondents: Businesses or other for-profit (including small businesses).

Frequency of response: Recordkeeping requirement.

Estimated annual burden: 2,144 recordkeepers, 2 hours average burden per recordkeeper; 4,288 hours total annual burden.

Needs and uses: Section 76.79 requires that every cable employment unit maintain, for public inspection, a file containing copies of all annual employment reports and related documents. The data is used by the general public to assess a cable unit's EEO program.

Federal Communications Commission.

William F. Caton,

Acting Secretary.

Petitions for Reconsideration of Actions in Rule Making Proceedings

November 7, 1991.

Petitions for reconsideration have been filed in the Commission rule making proceedings listed in this Public Notice and published pursuant to 47 CFR 1.429(e). The full text of these documents are available for viewing and copying in room 239, 1919 M Street, NW., Washington, DC or may be purchased from the Commission's copy contractor Downtown Copy Center (202) 452-1422. Oppositions to these petitions must be filed December 13, 1991. See § 1.4(b)(1) of the Commission's rules (47 CFR 1.4(b)(1)). Replies to an opposition must be filed within 10 days after the time for filing oppositions has expired.

SUBJECT: Amendment of part 73 of the Commission Rules to Permit Short-Spaced FM Station Assignments by Using Directional Antennas. (MM Docket No. 87-121). *Number of Petitions Received:* 1.

SUBJECT: Resolution of Interface Between UHF Channels 14 and 69 Adjacent Channel Land Mobile Operations. (MM Docket No. 87-465) *Number of Petitions Received:* 3.

SUBJECT: Amendment of § 73.202(b), Table of Allotments, FM Broadcast Stations. (Culebra and Vieques, Puerto Rico, Christiansted, Virgin Virgin Islands) (MM Docket No. 89–495, RM Nos. 6940 & 7272). *Number of Petitions Received:* 1.

SUBJECT: Amendment of Part 90 of the Commission's Rules to Permit the Short-Spacing of Specialized Mobile Radio System Upon Concurrence from Co-Channel Licensees (MM Docket No. 90–34). *Number of Petitions Received:* 4.

Federal Communications Commission.

FEDERAL EMERGENCY MANAGEMENT AGENCY

[FEMA–923–DR]

New Hampshire; Major Disaster and Related Determinations

AGENCY: Federal Emergency Management Agency.

ACTION: Notice.

SUMMARY: This is a notice of the Presidential declaration of a major disaster for the State of New Hampshire (FEMA–923–DR), dated November 13, 1991, and related determinations.

DATED: November 13, 1991.

FOR FURTHER INFORMATION CONTACT: Pauline C. Campbell, Disaster Assistance Programs, Federal Emergency Management Agency, Washington, DC 20472 (202) 646–3606.

Notice

Notice is hereby given that, in a letter dated November 13, 1991, the President declared a major disaster under the authority of the Robert T. Stafford Disaster Relief and Emergency Assistance Act (42 U.S.C. 5121 *et seq.*, Public Law 93–288, as amended by Public Law 100–707), as follows:

I have determined that the damage in certain areas of the State of New Hampshire resulting from a major coastal storm on October 30, 1991, through and including October 31, 1991, is of sufficient severity and magnitude to warrant a major disaster declaration under the Robert T. Stafford Disaster Relief and Emergency Assistance Act ("the Stafford Act"). I, therefore, declare that such a major disaster exists in the State of New Hampshire.

In order to provide Federal assistance, you are hereby authorized to allocate from funds available for these purposes, such amounts as you find necessary for Federal disaster assistance and administrative expenses.

You are authorized to provide Individual Assistance and Public Assistance in the designated areas. Consistent with the requirement that Federal assistance be supplemental, any Federal funds provided under the Stafford Act for Public Assistance will be limited to 75 percent of the total eligible costs.

The time period prescribed for the implementation of Section 310(a), Priority to Certain Applications for Public Facility and Public Housing Assistance, shall be for a period not to exceed six months after the date of this declaration.

Notice is hereby given that pursuant to the authority vested in the Director of the Federal Emergency Management Agency under Executive Order 12148, I hereby appoint Mr. Richard H. Strome of the Federal Emergency Management Agency to act as the Federal Coordinating Officer for this declared disaster.

I do hereby determine the following areas of the State of New Hampshire to have been affected adversely by this declared major disaster:

Rockingham County for Individual Assistance and Public Assistance.

(Catalog of Federal Domestic Assistance No. 83.516, Disaster Assistance.)

Wallace E. Stickney,

Director, Federal Emergency Management Agency.

[FEMA–922–DR]

Washington; Major Disaster and Related Determinations

AGENCY: Federal Emergency Management Agency.

ACTION: Notice.

SUMMARY: This is a notice of the Presidential declaration of a major disaster for the State of Washington (FEMA–922–DR), dated November 13, 1991, and related determinations.

DATED: November 13, 1991.

FOR FURTHER INFORMATION CONTACT: Pauline C. Campbell, Disaster Assistance Programs, Federal Emergency Management Agency, Washington, DC 20472 (202) 646–3606.

Notice

Notice is hereby given that, in a letter dated November 13, 1991, the President declared a major disaster under the authority of the Robert T. Stafford Disaster Relief and Emergency Assistance Act (42 U.S.C. 5121 *et seq.*, Public Law 93–288, as amended by Public Law 100–707), as follows:

I have determined that the damage in certain areas of the State of Washington, resulting from fire occurring October 16 through and including October 24, 1991, is of sufficient severity and magnitude to warrant a major disaster declaration under the Robert T. Stafford Disaster Relief and Emergency Assistance Act ("the Stafford Act"). I, therefore, declare that such a major disaster exists in the State of Washington. This major disaster declaration supersedes and rescinds fire suppression declaration FEMA–2079–FSA of October 18, 1991.

In order to provide Federal assistance, you are hereby authorized to allocate from funds available for these purposes, such amounts as you find necessary for Federal disaster assistance and administrative expenses.

You are authorized to provide Individual Assistance and Public Assistance in the designated areas. Consistent with the requirement that Federal assistance be supplemental, any Federal funds provided under the Stafford Act for Public Assistance will be limited to 75 percent of the total eligible costs.

The time period prescribed for the implementation of section 310(a), Priority to Certain Applications for Public Facility and Public Housing Assistance, shall be for a period not to exceed six months after the date of this declaration.

Notice is hereby given that pursuant to the authority vested in the Director of the Federal Emergency Management Agency under Executive Order 12148, I hereby appoint Mr. Richard A. Buck of the Federal Emergency Management Agency to act as the Federal Coordinating Officer for this declared disaster.

I do hereby determine the following areas of the State of Washington to have been affected adversely by this declared major disaster:

The counties of Spokane, Stevens, Lincoln, and Pend Oreille for Individual Assistance and Public Assistance.

(Catalog of Federal Domestic Assistance No. 83–516, Disaster Assistance.)

FEDERAL MARITIME COMMISSION

Agreement(s) Filed; City of Long Beach, et al.

The Federal Maritime Commission hereby gives notice of the filing of the following agreement(s) pursuant to section 5 of the Shipping Act of 1984.

Interested parties may inspect and obtain a copy of each agreement at the Washington, DC Office of the Federal

Maritime Commission, 1100 L Street, NW., room 10325. Interested parties may submit comments on each agreement to the Secretary, Federal Maritime Commission, Washington, DC 20573, within 10 days after the date of the **Federal Register** in which this notice appears. The requirements for comments are found in § 572.603 of title 46 of the Code of Federal Regulations. Interested persons should consult this section before communicating with the Commission regarding a pending agreement.

Agreement No.: 224–002491–006
Title: Amended and Restated Preferential Assignment Agreement between City of Long Beach and International Transportation Service, Inc.
Parties:
City of Long Beach
International Transportation Service, Inc. (I.T.S.)
Synopsis: The Agreement, filed November 18, 1991, adds additional areas to be used by I.T.S. for the terminal premises, revises the rent payable for the use of the terminal, eliminates obsolete provisions and restates the Agreement.

Agreement No.: 224–200349–001
Title: Marine Terminal Lease Agreement between City of Salem Municipal Port Authority and Salem Marine Terminal Corporation.
Parties:
City of Salem Municipal Port Authority
Salem Marine Terminal Corporation ("SMTC")
Salem Stevedoring Corp. ("SSC")
Synopsis: The Agreement, filed November 18, 1991, provides for the assignment of all of the right, title and interest of SMTC to SSC.

Agreement No.: 224–200349–002
Title: Marine Terminal Lease Agreement between City of Salem Municipal Port Authority and Salem Marine Terminal Corporation.
Parties:
City of Salem Municipal Port Authority
Salem Marine Terminal Corporation ("SMTC")
Salem Stevedoring Corp. ("SSC")
Synopsis: The Agreement, filed November 18, 1991, is a primary "Collateral Agreement of Assignment" in which SSC grants SMTC a security interest in the Lease Agreement. This is to secure the performance by SSC and Salem Port Development Corp., under certain other agreements to which each is a party.

Agreement No.: 224–200349–003.
Title: Marine Terminal Lease Agreement between City of Salem Municipal Port Authority and Salem Marine Terminal Corporation.
Parties:
City of Salem Municipal Port Authority
Salem Marine Terminal Corporation ("SMTC")
Salem Stevedoring Corp. ("SSC")
Synopsis: The Agreement, filed November 18, 1991, is a secondary "Collateral Assignment" in which SMTC grants Monte Dei Paschi Di Siena a security interest in the Collateral Assignment to SMTC. This is to secure the performance by SMTC and the fifty/fifty partnership under certain other agreements to which each is a party.

Agreement No.: 212–009847–028.
Title: U.S. Atlantic Coast/Brazil Agreement.
Parties:
Companhia de Navegacao Lloyd Brasileiro
Companhia de Navegacao Maritime Netumar
Companhia de Maritima Nacional
American Transport Lines, Inc.
Synopsis: The proposed amendment would extend the current 98 percent carrying rate to June 30, 1992. It would divide calendar year 1992 into two six-month pool periods, and would provide for a 90-day notice period prior to a party's withdrawal from the Agreement.

Agreement No.: 212–009848–027.
Title: U.S. Gulf Ports/Brazil Agreement.
Parties:
Companhia de Navegacao Lloyd Brasileiro
Companhia de Maritima Nacional
American Transport Lines, Inc.
Synopsis: The proposed amendment would establish two six-month pool periods for calendar year 1992, and would establish a 95 percent carrying rate for the first 1992 pool period, as well as provide notice periods for withdrawal from the Agreement. The amendment would also extend the Agreement's alternate coast service and special forfeiture provisions through 1992.

Agreement No.: 212–010027–034.
Title: Brazil/U.S. Atlantic Coast Agreement.
Parties:
Companhia de Navegacao Lloyd Brasileiro
Companhia de Navegacao Maritima Netumar
Companhia de Maritima Nacional
American Transport Lines, Inc.
Empresa Lineas Maritimas Argentinas S/A
A. Bottacchi S.A. de Navegacion C.F.I.I. ("Bottacchi")
Synopsis: The proposed amendment would establish two six-month pool periods for calendar year 1992 and would decrease the special carrying rate of 100 percent to 98 percent for the first 1992 pool period. The amendment would also permit withdrawal from the Agreement on short notice during the first 1992 pool period and would delete Bottacchi as a party to the Agreement. The parties have requested a shortened review period.

Agreement No.: 212–011213–024.
Title: Spain-Italy/Puerto Rico Island Pool Agreement.
Parties:
Compania Transatlantica Espanola, S.A.
d'Amico Societa de Navigazione, S.p.A.
Nordana Line A/S
Sea-Land Service, Inc.
Synopsis: This modification revises the Agreement by adding a new pool period to cover the period of January 1, 1992 through June 30, 1992. Additionally, corresponding changes have been made to provide that no member may withdraw from the Agreement or any pool section until June 30, 1992.

Dated: November 21, 1991.

By Order of the Federal Maritime Commission.

Joseph C. Polking,

Secretary.

BILLING CODE 6730-01-M

Security for the Protection of the Public Indemnification of Passengers for Nonperformance of Transportation; Issuance of Certificate (Performance); Danish Cruise Lines, Inc.

Notice is hereby given that the following have been issued a certificate of Financial Responsibility for Indemnification of Passengers for Nonperformance of Transportation pursuant to the provisions of section 3, Public Law 89-777 (46 U.S.C. 817(e)) and the Federal Maritime Commission's implementing regulations at 46 CFR part 540, as amended:

Danish Cruise Lines, Inc., Metro Office Park, Calle 1, Lot 11, Suite 4, Guaynabo, Puerto Rico 00968.
Vessel: Scandinavian Song.

Dated: November 22, 1991.

Joseph C. Polking,

Secretary.

[FR Doc. 91-28462 Filed 11-26-91; 8:45 am]

BILLING CODE 6730

FEDERAL RESERVE SYSTEM

Federal Open Market Committee; Domestic Policy Directive of October 1, 1991

In accordance with § 271.5 of its rules regarding availability of information, there is set forth below the domestic policy directive issued by the Federal Open Market Committee at its meeting held on October 1, 1991.[1] The Directive was issued to the Federal Reserve Bank of New York as follows:

The information reviewed at this meeting has been mixed, but it suggests on balance that economic activity has been expanding at a moderate pace. Total nonfarm payroll employment changed little over July and August, and the civilian unemployment rate was 6.8 percent in both months. Employment in manufacturing continued to advance in August, and industrial production posted a further rise after several months of sizable gains. Consumer spending increased considerably on balance in July and August. Recent data on orders and shipments of nondefense capital goods point to a small increase in real outlays for business equipment, but nonresidential construction has remained weak. Housing starts rose only slightly further in July and August after increasing appreciably on balance since January. The nominal U.S. merchandise trade deficit widened substantially in July and was considerably above its average rate in the second quarter. Increases in consumer prices have been small in recent months, owing to declines in food and energy prices.

Most interest rates have declined further since the Committee meeting on August 20. The Board of Governors approved a reduction in the discount rate from 5-1/2 to 5 percent on September 13. The trade-weighted value of the dollar in terms of the other G-10 currencies fell sharply over the intermeeting period; much of the drop retraced the previous run-up associated with the attempted coup in the Soviet Union that began shortly before the August Committee meeting.

After contracting in July, M2 was about unchanged in August and September. M3 declined further in July and August and is indicated to have changed little in September. For the year thus far, expansion of M2 and M3 has been at the lower end of the Committee's ranges.

The Federal Open Market Committee seeks monetary and financial conditions that will foster price stability and promote sustainable growth in output. In furtherance of these objectives, the Committee at its meeting in July reaffirmed the ranges it has established in February for growth of M2 and M3 of 2-1/2 to 6-1/2 percent and 1 to 5 percent, respectively, measured from the fourth quarter of 1990 to the fourth quarter of 1991. The monitoring range for growth of total domestic nonfinancial debt also was maintained at 4-1/2 to 8-1/2 percent for the year. For 1992, on a tentative basis, the Committee agreed in July to use the same ranges as in 1991 for growth in each of the monetary aggregates and debt, measured from the fourth quarter of 1991 to the fourth quarter of 1992. With regard to M3, the Committee anticipated that the ongoing restructuring of thrift depository institutions would continue to depress the growth of this aggregate relative to spending and total credit. The behavior of the monetary aggregates will continue to be evaluated in light of progress toward price level stability, movements in their velocities, and developments in the economy and financial markets.

In the implementation of policy for the immediate future, the Committee seeks to maintain the existing degree of pressure on reserve positions. Depending upon progress toward price stability, trends in economic activity, the behavior of the monetary aggregates, and developments in foreign exchange and domestic financial markets, slightly greater reserve restraint might or slightly lesser reserve restraint would be acceptable in the intermeeting period. The contemplated reserve conditions are expected to be consistent with growth of M2 and M3 over the period from September through December at annual rates of about 3 and 1-1/2 percent, respectively.

By order of the Federal Open Market Committee, November 21, 1991.

Normand Bernard,

Deputy Secretary, Federal Open Market Committee.

[FR Doc. 91-28443 Filed 11-26-91; 8:45 am]

BILLING CODE 6210-01-F

[1] Copies of the Record of policy actions of the Committee for the meeting of October 1, 1991, are available upon request to The Board of Governors of the Federal Reserve System, Washington, DC 20551.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Administration for Children and Families

Federal Allotments to States for Social Services Expenditures, Pursuant to Title XX, Block Grants to States for Social Services; Promulgation for Fiscal Year 1993

AGENCY: Administration for Children and Families, Department of Health and Human Services.

ACTION: Notification of Allocation of State Title XX—Social Services Block Grant Allotments for Fiscal Year 1993.

SUMMARY: This issuance sets forth the individual allotments to States for Fiscal Year 1993, pursuant to Title XX of the Social Security Act, as amended (Act). The allotments to the States published herein are based upon the authorization set forth in section 2003 of the Act and are contingent upon Congressional appropriations for the fiscal year. If Congress enacts and the President approves an amount different from the authorization, the allotments will be adjusted proportionately.

FOR FURTHER INFORMATION CONTACT: L. Bryant Tudor, (202) 245-6275.

SUPPLEMENTARY INFORMATION: Section 2003 of the Act authorizes $2.8 billion for Fiscal Year 1993 and provides that it be allocated as follows:

(1) Puerto Rico, Guam, the Virgin Islands, and the Northern Mariana Islands each receives an amount which bears the same ratio to $2.8 billion as its allocation for Fiscal Year 1981 bore to $2.9 billion.

(2) American Samoa receives an amount which bears the same ratio to the amount allotted to the Northern Mariana Islands as the population of American Samoa bears to the population of the Northern Mariana Islands determined on the basis of the most recent data available at the time such allotment is determined.

(3) The remainder of the $2.8 billion is allotted to each State in the same proportion as that State's population is to the population of all States, based upon the most recent data available from the Department of Commerce.

For Fiscal Year 1993, the allotments are based upon the Bureau of Census population statistics contained in its report "Census Population—Housing" (CPH–L–4, Summer 1991) and "Census Bureau Press Releases" (CB 91–242 and CB 91–243, July 21, 1991), which is the most recent data available from the Department of Commerce at this time as to the population of each State.

EFFECTIVE DATE: The allotments shall be effective October 1, 1992.

Fiscal Year 1993 Federal Allotments to States for Social Services—Title XX Block Grants

Total	$2,800,000,000
Alabama	45,239,868
Alaska	6,157,369
American Samoa	104,188
Arizona	41,030,467
Arkansas	26,319,953
California	333,169,627
Colorado	36,877,042
Connecticut	36,798,675
Delaware	7,456,014

BILLING CODE 4130–01–M

DEPARTMENT OF THE INTERIOR

Bureau of Land Management

[CA–060–00–4351–12]

Closure and Restrictions on Public Land

AGENCY: Bureau of Land Management, Interior.

ACTION: Notice of closure and restrictions on public land for the protection and rehabilitation of sensitive plant and wildlife resources.

SUMMARY: Pursuant to the regulations contained in 43 CFR 8364.1 the Bureau of Land Management is closing to motorized vehicle travel approximately 200 acres of public lands in and around Sheep Hole Oasis, located within the Orocopia Mountains Wilderness Study Area (WSA CDCA No. 344). This closure includes all dry canyon wash routes and other trails except for approximately 1/2 mile of the dry wash bed leading from Hidden Spring Canyon to within approximately 300 feet from Sheep Hole Oasis, which remains open from November 1 to June 1. The legal description of the closure is as follows:

T. 7S., R. 10E. SBBM., Riverside County, California;
Section 2: SW¼SW¼;
Section 3: SE¼SE¼, E½SW¼SE¼;
Section 10: E½NE¼NE¼, NW¼NE¼NE¼;
Section 11: NW¼NW¼, W½SW¼NW¼, NE¼SW¼NW¼.

A map of the area described above may be viewed in the Resource Area office. This closure is necessary to prevent further deterioration of the soil and vegetation resources in that area, and to permit rehabilitation of these resources.

Personnel that are exempt from the area closure include any Federal, State or local officer, or member of any organized rescue or fire-fighting force in the performance of an official duty, or any person authorized by the Bureau.

DATES: This closure is effective November 27, 1991, and shall remain in effect until rescinded by the authorized officer.

PENALTIES: Violators are subject to fines and/or imprisonment.

FOR FURTHER INFORMATION CONTACT: Russell L. Kaldenberg, Palm Springs-South Coast Resource Area Manager, 63–500 Garnet Avenue, P.O. Box 2000, North Palm Springs, CA 92258–2000. (619) 251–0812.

Dated: November 15, 1991.

Gerald E. Hillier,

District Manager.

BILLING CODE 4310–40–M

INTERNATIONAL DEVELOPMENT COOPERATION AGENCY

Agency for International Development

Voluntary Foreign Aid Advisory Committee; Meeting

Pursuant to the Federal Advisory Committee Act, notice is hereby given of a meeting of the Advisory Committee on Voluntary Foreign Aid (ACVFA) Thursday, December 12, 1991, and Friday, December 13, 1991. Topic for discussion will be Effective Development Strategies for the '90's.

Date: December 12, 1991, 2–5:30 p.m. December 13, 1991, 9 a.m.–2:30 p.m.

Place: State Department.

The meeting is free and open to the public. However, notification by December 9, 1991, through the advisory committee headquarters is required.

Persons wishing to attend the meeting must call Theresa Graham or Susan Saragi (202) 663–2523, or facsimile (202) 663–2629. Persons attending must include their name, organization, birthdate and social security number for security purposes.

Dated: November 21, 1991.

Sally H. Montgomery,

Deputy Assistant Administrator, Private and Voluntary Cooperation, Food and Humanitarian Assistance.

BILLING CODE 6116–01–M

INTERSTATE COMMERCE COMMISSION

[Ex Parte No. 394 (Sub-No. 9)]

Cost Ratio for Recyclables; 1992 Determination

AGENCY: Interstate Commerce Commission.

ACTION: Notice of rate caps and initiation of first annual compliance proceeding.

SUMMARY: The Commission has calculated proposed 1992 revenue-to-variable cost (R/VC) ratios as ceilings for rates on nonferrous recyclables under 49 U.S.C. 10731(e). The R/VC ratios were calculated in accordance with established procedures using the Uniform Railroad Costing System (URCS). Because URCS develops different variability percentages for different railroads the final rules adopted at 49 CFR part 1145, in Cost Ratios for Recyclables— Compliance Procedures, 8 I.C.C.2d 182 (1991), allow separate R/VC ratio ceilings for individual railroads to apply in the context of monitoring compliance. The proposed national average R/VC ratio is 141.0 percent. Individual and regional R/VC ratios are proposed. In addition, the Commission is initiating the first annual compliance proceeding in accordance with rules adopted in Ex Parte No. 394 (Sub-No. 3), *supra*, including the schedule for completing the proceeding.

EFFECTIVE DATE: December 17, 1991, unless, within that time, comments are received challenging the accuracy of the ratios, in which case a further decision will be issued.

FOR FURTHER INFORMATION CONTACT: William T. Bono (202) 275–7354 [TDD for hearing impaired (202) 275–1721].

SUPPLEMENTARY INFORMATION: Additional information is contained in the Commission's decision. To purchase a copy of the full decision, write to, call or pick up in person from: Dynamic Concepts, Inc., room 2229, Interstate Commerce Commission Building, Washington, DC 20423. Telephone (202) 289–4357/4359. Assistance for the hearing impaired is available through TDD services (202) 275–1721.

This decision will not significantly affect the quality of the human environment or the conservation of energy resources.

Authority: 49 U.S.C. 10321(a), 10731, 5 U.S.C. 553.

Decided: November 20, 1991.

By the Commission, Chairman Philbin, Vice Chairman Emmett, Commissioners Simmons, Phillips, and McDonald.

Sidney L. Strickland, Jr.,

Secretary.

[FR Doc. 91–28449 Filed 11–26–91; 8:45 am]

BILLING CODE 7035–01–M

[Finance Docket No. 31934]

South Central Tennessee Railroad Co.—Lease and Operation Exemption—CSX Transportation, Inc.

AGENCY: Interstate Commerce Commission.

ACTION: Notice of exemption.

SUMMARY: The Commission, under 49 U.S.C. 10505, exempts South Central Tennessee Railroad Company from the prior approval requirements of 49 U.S.C. 11343, *et seq.*, to lease and operate, as a Class III rail carrier, an approximately 0.72-mile rail line owned by CSX Transportation, Inc.

DATES: This exemption is effective on December 27, 1991. Petitions for stay must be filed by December 12, 1991 and petitions for reconsideration must be filed by December 23, 1991.

ADDRESSES: Send pleadings referring to Finance Docket No. 31934 to:

(1) Office of the Secretary, Case Control Branch, Interstate Commerce Commission, Washington, DC 20423.

(2) Petitioners' representatives, Fritz R. Kah, Verner, Liipfert, Bernhard, McPherson and Hand, Suite 700, 901 15th Street, NW., Washington, DC 20005. Charles M. Rosenberger, CSX Transportation, Inc., 500 Water Street, J150, Jacksonville, FL 32202.

FOR FURTHER INFORMATION CONTACT: Joseph H. Dettmar, (202) 275–7245.

(TDD for hearing impaired: (202) 275–1721).

SUPPLEMENTARY INFORMATION: Additional information is contained in the Commission's decision. To purchase a copy of the full decision, write to, call, or pick up in person from: Dynamic Concepts, Inc., room 2229, Interstate Commerce Commission Building, Washington, DC 20423. Telephone (202) 289–4357/4359. Assistance for the hearing impaired is available through TDD services (202) 275–1721.

Decided: November 20, 1991.

By the Commission, Chairman Philbin, Vice Chairman Emmett, Commissioners Simmons, Phillips, and McDonald.

Sidney L. Strickland, Jr.

Secretary.

DEPARTMENT OF LABOR

Bureau of Labor Statistics

State Research Advisory Committee on Occupational Safety and Health Statistics; Meeting

The State research Advisory Committee on Occupational Safety and Health Statistics, established to make recommendations to the Bureau of Labor Statistics on proposals for the redesign of the Bureau's safety and health statistics program, will meet on December 10, 1991. The Committee will meet at the Hotel Westcourt, 10220 N. Metro Parkway East, Phoenix, Arizona 85051. The meeting will be held from 8:30 a.m. until 5 p.m. in the hotel's Grande Ballroom.

The redesign of the Bureau's safety and health statistical program and plans for implementation will be discussed, including a review of pilot projects, computer hardware and software design and tests, and State participation.

The public is invited to attend. It is suggested that persons planning to attend as observers contact William Eisenberg, committee liaison, on (202) 501–6467. Official records of the meeting will be available for public inspection at the General Accounting Office Building, room 2870, 441 G Street, NW., Washington, DC 20212.

Due to scheduling difficulties, we are unable to provide the full 15 days of advance notice of this meeting.

Signed at Washington, DC, this 20th day of November 1991.

Janet L. Norwood,

Commissioner of Labor Statistics.

[FR Doc. 91–28481 Filed 11–26–91; 8:45 am]

BILLING CODE 4510–24–M

NATIONAL COMMUNICATIONS SYSTEM

Meeting; Industry Executive Subcommittee of the National Security Telecommunications Advisory Committee

A meeting of the Industry Executive Subcommittee of the National Security Telecommunications Advisory Committee will be held on Wednesday, December 11, 1991, from 9 a.m. to 1:15 p.m. The meeting will be held at the Mitre-Hayes Building, 7525 Colshire Dr., McLean, VA 27006. The agenda is as follows:

A. Administrative Remarks/NSTAC XIV Update
B. Network Security
C. Membership Issues (Energy, OWG/PWG, TSP Oversight)
D. Operations Working Group (OWG)
E. Plans Working Group (PWG)
F. National Level Program (NLP) Status Briefing
G. TSP Oversight Committee Report
H. National Coordinating Center (NCC) Status Update

Due to the requirement to discuss classified information, in conjunction with the issues listed above, the meeting will be closed to the public in the interest of National Defense. Any person desiring information about the meeting may telephone (703) 692-9274 or write the Manager, National Communications System, 701 S. Court House Rd., Arlington, VA 22202-2199.

Beverely Sampson,

Federal Register Liaison Officer.

Dennis I. Parsons,

Captain, USN, Assistant Manager, NCS Joint Secretariat.

BILLING CODE 7555-01-M

NUCLEAR REGULATORY COMMISSION

[Docket No. 50-267]

Environmental Assessment and Finding of No Significant Impact; Public Service Company of Colorado; Fort St. Vrain Nuclear Generating Station

The U.S. Nuclear Regulatory Commission (NRC or the Commission) is considering issuance of an exemption from the requirements of 10 CFR 55.45(b), 10 CFR 55.33(a)(2), 10 CFR 55.59(a)(2), (c)(2), (c)(3), and (c)(4) to the Public Service Company of Colorado (PSC or the licensee) for possession of the Fort St. Vrain Nuclear Generating Station, Unit 1 (the facility) located in Weld County, Colorado.

Environmental Assessment

Identification of Proposed Action

The proposed action would grant an exemption from the requirements of 10 CFR 55.45(b), 55.33(a)(2), 55.59(a)(2), and 55.59(c)(3) to the extent that these regulations require the use of a simulation facility in implementing operating tests and on-the-job training. Additionally, the proposed action would grant an exemption from 10 CFR 55.59(a)(2), (c)(2), (c)(3), and (c)(4) to the extent that these regulations apply to requalification requirements specific to power operations of a nuclear facility. By letter dated November 9, 1990, PSC requested an exemption from the above specified requirements of 10 CFR part 55 related to the use of a simulation facility in implementing operating tests and on-the-job training. The U.S. Nuclear Regulatory Commission (NRC) is further proposing related action which includes an exemption from the regulations that apply to requalification requirements specific to power operations of a nuclear facility. The NRC has proposed this related action due to its practicality and close relation to the intent of the licensee's November 9, 1990 request.

The Need for the Proposed Action

The requirements of 10 CFR part 55 for a simulation facility are designed for operating power reactors. There are no plant-referenced simulator devices that reflect the current partially defueled and permanently shutdown condition of FSV. Likewise, the requalification requirements of 10 CFR 55.59 are designed for the complex operations associated with an operating plant from start-up through full-power operation. The licensee ceased power operation at FSV on August 18, 1989. In addition, the Commission issued a possession only license on May 21, 1991, preventing operation of the FSV reactor.

In the partially defueled and permanently shutdown condition, the principal operator activity will be to complete the defueling of the reactor and to monitor the spent fuel storage well to assure the continued safe storage of special nuclear material to that the public health and safety is not compromised. Additionally, the knowledge required of operators in a permanently shutdown status is far less than that required for an operating facility. The request for an exemption from the requirements of 10 CFR part 55, as mentioned above, is based on the above plant conditions and the licensee's intent not to resume power operations at FSV.

Environmental Impacts of the Proposed Action

The proposed exemption does not increase the risk of facility accidents because of the partially defueled and permanently shutdown condition of the plant. With the reactor vessel partially defueled and the licensee not licensed to resume power operation at FSV, design-basis accidents associated with an operating plant from start-up through full-power operation are no longer credible.

In the shutdown condition of the plant, the principal operator activity will be to complete defueling of the reactor and to monitor the spent fuel storage well to assure the continued safe storage of special nuclear material so that the public health and safety is not compromised. This exemption would enable the licensee to continue to train its operators for their principal activities without a simulation facility and without expending excessive resources and time training personnel for unrelated power activities. The remaining requalification training to be accomplished without a simulation facility ensures protection of the public health and safety and is appropriate to the partially defueled condition of the plant. Design-basis accidents for a nuclear facility in a defueled condition are all associated with a loss of fuel storage well cooling or with fuel handling. The remaining requalification training to be accomplished without a simulation facility ensures protection of the public health and safety and is appropriate to the partially defueled and permanently shutdown condition of the plant.

Any potential post-accident radiological releases will not differ from those determined previously, and the proposed exemption does not otherwise

affect facility radiological effluents or present any significant occupational exposures. The proposed exemption does not affect plant nonradiological effluents and thus has no adverse environmental impact. Therefore, the Commission concludes that there are no measurable radiological or nonradiological environmental impacts associated with the proposed exemption.

Since the Commission has concluded there are no measurable environmental impacts associated with the proposed exemption, any alternative will have either no environmental impact or a greater environmental impact. The principal alternative to the exemption would be to require a simulation facility and require requalification training geared to operating power reactors. Such action would not enhance the protection of the environment and would result in unnecessary expenditure of licensee and Commission resources.

Alternate Use of Resources

This action does not involve the use of resources not considered previously in the Final Environmental Statement for the Fort St. Vrain Nuclear Generating Station.

Agencies and Persons Consulted

The NRC staff reviewed the licensee's request and did not consult other agencies or persons.

Finding of No Significant Impact

On the basis of the environmental assessment, the NRC staff concludes that the proposed action will not have a significant effect on the quality of the human environment. Therefore, the Commission has determined not to prepare an environmental impact statement for the proposed exemption.

For further details with respect to this action, see the licensee's letter dated November 9, 1990, which is available for public inspection at the Commission's Public Document Room, the Gelman Building, 2120 L Street, NW., Washington, DC 20555, and at the Greeley Public Library, City Complex Building, Greeley, Colorado 80631.

Dated at Rockville, Maryland this 20th day of November 1991.

For the Nuclear Regulatory Commission.

Richard F. Dudley, Jr.,

Acting Director Non-Power Reactors, Decommissioning and Environmental Project Directorate, Division of Advanced Reactors and Special Projects, Office of Nuclear Reactor Regulation.

[FR Doc. 91-28456 Filed 11-26-91; 8:45 am]

BILLING CODE 7590-01-M

Biweekly Notice Applications and Amendments to Operating Licenses Involving No Significant Hazards Considerations

I. Background

Pursuant to Public Law (P.L.) 97-415, the Nuclear Regulatory Commission (the Commission) is publishing this regular biweekly notice. P.L. 97-415 revised section 189 of the Atomic Energy Act of 1954, as amended (the Act), to require the Commission to publish notice of any amendments issued, or proposed to be issued, under a new provision of section 189 of the Act. This provision grants the Commission the authority to issue and make immediately effective any amendment to an operating license upon a determination by the Commission that such amendment involves no significant hazards consideration, notwithstanding the pendency before the Commission of a request for a hearing from any person.

This biweekly notice includes all notices of amendments issued, or proposed to be issued from November 4, 1991 through November 15, 1991. The last biweekly notice was published on November 13, 1991 (56 FR 57687).

Notice Of Consideration Of Issuance Of Amendment To Facility Operating License and Proposed No Significant Hazards Consideration Determination and Opportunity for Hearing

The Commission has made a proposed determination that the following amendment requests involve no significant hazards consideration. Under the Commission's regulations in 10 CFR 50.92, this means that operation of the facility in accordance with the proposed amendments would not (1) involve a significant increase in the probability or consequences of an accident previously evaluated; or (2) create the possibility of a new or different kind of accident from any accident previously evaluated; or (3) involve a significant reduction in a margin of safety. The basis for this proposed determination for each amendment request is shown below.

The Commission is seeking public comments on this proposed determination. Any comments received within 30 days after the date of publication of this notice will be considered in making any final determination. The Commission will not normally make a final determination unless it receives a request for a hearing.

Written comments may be submitted by mail to the Regulatory Publications Branch, Division of Freedom of Information and Publications Services, Office of Administration, U.S. Nuclear Regulatory Commission, Washington, DC 20555, and should cite the publication date and page number of this **Federal Register** notice. Written comments may also be delivered to Room P-223, Phillips Building, 7920 Norfolk Avenue, Bethesda, Maryland from 7:30 a.m. to 4:15 p.m. Copies of written comments received may be examined at the NRC Public Document Room, the Gelman Building, 2120 L Street, NW., Washington, DC 20555. The filing of requests for hearing and petitions for leave to intervene is discussed below.

By December 27, 1991, the licensee may file a request for a hearing with respect to issuance of the amendment to the subject facility operating license and any person whose interest may be affected by this proceeding and who wishes to participate as a party in the proceeding must file a written request for a hearing and a petition for leave to intervene. Requests for a hearing and a petition for leave to intervene shall be filed in accordance with the Commission's "Rules of Practice for Domestic Licensing Proceedings" in 10 CFR Part 2. Interested persons should consult a current copy of 10 CFR 2.714 which is available at the Commission's Public Document Room, the Gelman Building, 2120 L Street, NW., Washington, DC 20555 and at the local public document room for the particular facility involved. If a request for a hearing or petition for leave to intervene is filed by the above date, the Commission or an Atomic Safety and Licensing Board, designated by the Commission or by the Chairman of the Atomic Safety and Licensing Board Panel, will rule on the request and/or petition; and the Secretary or the designated Atomic Safety and Licensing Board will issue a notice of hearing or an appropriate order.

As required by 10 CFR 2.714, a petition for leave to intervene shall set forth with particularity the interest of the petitioner in the proceeding, and how that interest may be affected by the results of the proceeding. The petition should specifically explain the reasons why intervention should be permitted with particular reference to the following factors: (1) the nature of the petitioner's right under the Act to be made a party to the proceeding; (2) the nature and extent of the petitioner's property, financial, or other interest in the proceeding; and (3) the possible effect of any order which may be entered in the proceeding on the petitioner's interest. The petition should also identify the specific aspect(s) of the subject matter of the proceeding as to which petitioner wishes to intervene.

Any person who has filed a petition for leave to intervene or who has been admitted as a party may amend the petition without requesting leave of the Board up to fifteen (15) days prior to the first prehearing conference scheduled in the proceeding, but such an amended petition must satisfy the specificity requirements described above.

Not later than fifteen (15) days prior to the first prehearing conference scheduled in the proceeding, a petitioner shall file a supplement to the petition to intervene which must include a list of the contentions which are sought to be litigated in the matter. Each contention must consist of a specific statement of the issue of law or fact to be raised or controverted. In addition, the petitioner shall provide a brief explanation of the bases of the contention and a concise statement of the alleged facts or expert opinion which support the contention and on which the petitioner intends to rely in proving the contention at the hearing. The petitioner must also provide references to those specific sources and documents of which the petitioner is aware and on which the petitioner intends to rely to establish those facts or expert opinion. Petitioner must provide sufficient information to show that a genuine dispute exists with the applicant on a material issue of law or fact. Contentions shall be limited to matters within the scope of the amendment under consideration. The contention must be one which, if proven, would entitle the petitioner to relief. A petitioner who fails to file such a supplement which satisfies these requirements with respect to at least one contention will not be permitted to participate as a party.

Those permitted to intervene become parties to the proceeding, subject to any limitations in the order granting leave to intervene, and have the opportunity to participate fully in the conduct of the hearing, including the opportunity to present evidence and cross-examine witnesses.

If a hearing is requested, the Commission will make a final determination on the issue of no significant hazards consideration. The final determination will serve to decide when the hearing is held.

If the final determination is that the amendment request involves no significant hazards consideration, the Commission may issue the amendment and make it immediately effective, notwithstanding the request for a hearing. Any hearing held would take place after issuance of the amendment.

If the final determination is that the amendment request involves a significant hazards consideration, any hearing held would take place before the issuance of any amendment.

Normally, the Commission will not issue the amendment until the expiration of the 30-day notice period. However, should circumstances change during the notice period such that failure to act in a timely way would result, for example, in derating or shutdown of the facility, the Commission may issue the license amendment before the expiration of the 30-day notice period, provided that its final determination is that the amendment involves no significant hazards consideration. The final determination will consider all public and State comments received before action is taken. Should the Commission take this action, it will publish in the **Federal Register** a notice of issuance and provide for opportunity for a hearing after issuance. The Commission expects that the need to take this action will occur very infrequently.

A request for a hearing or a petition for leave to intervene must be filed with the Secretary of the Commission, U.S. Nuclear Regulatory Commission, Washington, DC 20555, Attention: Docketing and Services Branch, or may be delivered to the Commission's Public Document Room, the Gelman Building, 2120 L Street, NW., Washington DC 20555, by the above date. Where petitions are filed during the last ten (10) days of the notice period, it is requested that the petitioner promptly so inform the Commission by a toll-free telephone call to Western Union at 1-(800) 325-6000 (in Missouri 1-(800) 342-6700). The Western Union operator should be given Datagram Identification Number 3737 and the following message addressed to **(Project Director)**: petitioner's name and telephone number, date petition was mailed, plant name, and publication date and page number of this **Federal Register** notice. A copy of the petition should also be sent to the Office of the General Counsel, U.S. Nuclear Regulatory Commission, Washington, DC 20555, and to the attorney for the licensee.

Nontimely filings of petitions for leave to intervene, amended petitions, supplemental petitions and/or requests for hearing will not be entertained absent a determination by the Commission, the presiding officer or the Atomic Safety and Licensing Board that the petition and/or request should be granted based upon a balancing of factors specified in 10 CFR 2.714(a)(1)(i)-(v) and 2.714(d).

For further details with respect to this action, see the application for amendment which is available for public inspection at the Commission's Public Document Room, the Gelman Building, 2120 L Street, NW., Washington, DC 20555, and at the local public document room for the particular facility involved.

Commonwealth Edison Company, Docket Nos. 50-237 and 50-249, Dresden Nuclear Power Station, Units 2 and 3, Grundy County, Illinois

Date of application for amendment request: October 14, 1991

Description of amendment request: The proposed amendments reflect the current turbine control valve fast acting solenoid valve design and the addition of pressure setpoints to activate the pressure switches. The current design utilizes a pressure switch to initiate the turbine generator load rejection scram (turbine control valve fast closure scram) function, instead of a limit switch as originally designed.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

1. The proposed change does not involve a significant increase in the probability or consequences of an accident.

The turbine generator load rejection scram (turbine control valve fast closure scram) is provided to mitigate the anticipated rapid increase in pressure and neutron flux resulting from the fast closure of the turbine control valves due to a load reject coupled with the subsequent failure of the bypass valves (UFSAR Sections 3.2.4.3.1 and 11.2.3.2). The turbine control valves are required to fast close as rapidly as possible to prevent overspeed of the turbine-generator rotor (and prevent any potential damage). The rapid closure of the control valves causes a sudden reduction of the steam flow which results in an increase to reactor pressure. The scram is provided to avoid exceeding the Minimum Critical Power Ratio (MCPR) safety limit.

The use of a pressure switch (in lieu of a limit switch) does not involve a significant increase in the probability of the transient. Upon actuation of the fast acting solenoid, the pressure switch will sense the decreasing electro-hydraulic control (EHC) fluid (which will cause control valve closure) and generate a reactor scram. The use of the pressure switch, therefore, provides the same function as the limit switch. In addition, the logic for the Reactor Protection System (RPS) trip remains the same. The pressure switches on fast acting solenoid valves for control valves nos. 1 and 2 input one of the two RPS channels (RPS channel 'B' for Unit 2 and RPS channel 'A' for Unit 3). Either pressure switch will cause the respective channel to trip. Similarly, the pressure switches on the fast acting solenoid valves for control valves nos. 3 and 4 input into the other RPS channel (RPS channel 'A' for Unit 2 and RPS channel 'B' for Unit 3). In order to achieve a full reactor

scram, RPS channels 'A' and 'B' must be tripped.

The MCPR safety limit and Operating Limit MCPR are not adversely affected by the implementation of the pressure switch; therefore, fuel cladding integrity is assured. Additionally, the proposed changes do not alter, degrade, or prevent the responses of systems assumed in any accident nor do they alter any assumptions previously made in evaluating the radiological consequences of any accident.

The consequences of the turbine generator load reject coupled with the subsequent failure of the bypass valves are not significantly increased by the use of the pressure switch. During the load reject event, the pressure switch provides a scram signal to RPS in the same time period as a position switch on the fast acting solenoid valve. The use of a pressure switch to input into the Reactor Protection System is widely used throughout the industry and has been shown to be reliable. The results of the transient analysis (the lowest MCPR achieved) are not significantly affected and compliance with 10 CFR 100 limits is ensured.

2. The proposed change does not create the possibility of a new or different kind of accident from any accident previously evaluated.

The use of the pressure switch design for the turbine generator load rejection scram eliminates the failure mode associated with the previously utilized limit switch design; however, the pressure switch inherently introduces its own failure mode. The failure of the tubing which connects the pressure switch to the solenoid valve would initiate a scram signal. The use of the pressure switch to input into the Reactor Protection System is widely used throughout the industry and has been shown to be reliable.

The logic for the RPS trip remains unchanged. In order to create a reactor scram, the logic is arranged such that actuation of the pressure switches for the fast acting solenoid valves on control valve nos. 1 or 2 and 3 or 4 will initiate a reactor scram. Therefore, in order for the scram function to fail, two pressure switches would have to fail within the same RPS channel.

The fast closure of the turbine control valves is considered to be an anticipatory reactor scram. The reactor pressure and neutron flux would increase significantly in the event of the turbine control valve fast closure without a scram; however, the high reactor pressure (1060 psig) or the high neutron flux scrams provide backup to the turbine generator load rejection scram, in the event that the pressure switches fail to actuate RPS.

The existence of the new failure mode, therefore, does not introduce the possibility of a new or different kind of accident than previously evaluated.

3. The proposed change does not involve a significant reduction in the margin of safety.

The limiting event associated with the turbine control valve fast closure is the load reject with failure of the bypass valves. A reactor scram is initiated when the turbine control valves fast close to mitigate the anticipated increase in reactor pressure and neutron flux. This function ensures that the MCPR safety limit is not exceeded. The use of the pressure switch does not affect the margin of safety associated with the MCPR safety limit since the pressure switch will initiate the reactor scram within the same time period as a position switch on the fast acting solenoid valve. The trip setpoint was calculated to ensure that pressure switch actuation will occur within 30 milliseconds after the start of turbine control valve fast closure. Dresden Station's Technical Specifications require actuation of the RPS trip contacts within 50 milliseconds of the actuation of the pressure switch. These times are consistent with the design values used in the Reload Licensing calculation to analyze the load reject without bypass valve transient. Additionally, recent response time testing has verified pressure switch actuation within the prescribed limits (30 milliseconds). Therefore, a significant reduction in the margin of safety is not involved.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the requested amendments involve no significant hazards consideration.

Local Public Document Room location: Morris Public Library, 604 Liberty Street, Morris, Illinois 60450.

Attorney for licensee: Michael I. Miller, Esquire; Sidley and Austin, One First National Plaza, Chicago, Illinois 60690.

NRC Project Director: Richard J. Barrett

Detroit Edison Company, Docket No. 50-341, Fermi-2, Monroe County, Michigan

Date of amendment request: September 24, 1991

Description of amendment request: The proposed change revises the Technical Specifications by changing the Rod Block Monitor (RBM) down scale trip set point.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

The proposed change does not:

1) Involve a significant increase in the probability or consequences of an accident previously evaluated. The change makes setpoint modifications consistent with RBM system design changes such that the system will have greater sensitivity to RBM channel downscale conditions. Therefore, the RBM will terminate rod withdrawal sooner under these inappropriate conditions. The change does not affect the reliability of the RBM system. Therefore, the change does not involve a significant increase in the probability or consequences of any previously evaluated accident.

2) Create the possibility of a new or different kind of accident from any accident previously evaluated. The RBM downscale trip setpoint continues to function on abnormally low RBM channel signal output and acts to halt rod motion in the same manner. Therefore, no new accident scenarios are created.

3) Involve a significant reduction in a margin of safety. By providing greater sensitivity to RBM channel downscale condition safety margins are maintained.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Local Public Document Room location: Monroe County Library System, 3700 South Custer Road, Monroe, Michigan 48161.

Attorney for licensee: John Flynn, Esq., Detroit Edison Company, 2000 Second Avenue, Detroit, Michigan 48226.

NRC Project Director: L. B. Marsh.

Detroit Edison Company, Docket No. 50-341, Fermi-2, Monroe County, Michigan

Date of amendment request: September 25, 1991

Description of amendment request: The proposed amendment modifies the Reactor Protection System (RPS) Electrical Protective Assemblies (EPA) channel functional surveillance interval in Technical Specifications (TS) Surveillance Requirement 4.8.4.4.a. It changes the interval from at least once per six months to each time the plant is in cold shutdown for a period of more than 24 hours, unless the channel functional test has been performed in the previous six months. This eliminates the need to test the EPA during power operation and thereby reduces the possibility of inadvertent challenges to the protection systems. This surveillance requirement retains testing within a six-month interval when the unit is in cold shutdown for more than twenty-four hours. The proposed change is in accordance with the recommendations of Generic Letter 91-09.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

This amendment:

1. Does not involve a significant increase in the probability or consequences of an accident previously evaluated because this amendment does not alter the design, function, or operation of the EPAs. As stated in [Generic Letter 91-09], the benefit to safety by reducing the frequency of testing during power operation and the attendant possible

challenges to safety systems more than offsets any risk to safety from relaxing the surveillance requirement to test the EPAs during power operation.

2 Does not create the possibility of a new or different kind of accident from any accident previously evaluated. As stated above, this amendment does not alter the design, functions, or operation of the EPAs. The RPS relay trip logic remains protected from power supplies operating with out-to-tolerance voltage or frequency. Additionally, the redundancy of this protection is not changed. Therefore, no new or different accident scenarios are created.

3. Does not involve a significant reduction in a margin of safety because, as stated above, the benefit to safety by reducing the frequency of testing during power operation and the attendant possible challenges to safety systems more than offsets any risk to safety from relaxing the surveillance requirement to test the EPAs during power operation.

The NRC staff has reviewed the licensee's analysis and, based on this review, the staff has determined the three standards of 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Local Public Document Room location: Monroe County Library System, 3700 South Custer Road, Monroe, Michigan 48161.

Attorney for licensee: John Flynn, Esq., Detroit Edison Company, 2000 Second Avenue, Detroit, Michigan 48226.

NRC Project Director: L. B. Marsh.

Entergy Operations, Inc., Docket Nos. 50-313 and 50-368, Arkansas Nuclear One, Unit Nos. 1 and 2 (ANO-1&2), Pope County, Arkansas

Date of amendment request: October 15, 1991

Description of amendment request: This amendment would revise ANO-1 Technical Specifications (TS) 3.16 and 4.16 and ANO-2 TS 3/4.7.8 by replacing the existing snubber visual inspection schedule in the respective surveillance requirements with the snubber visual inspection schedule recommended in NRC Generic Letter 90-09. The amendment would also revise the surveillance requirements for visual inspection acceptance criteria to conform with the recommendations of Generic Letter 90-09. Additionally, a change to the TS ACTIONS is being made to reformat the required actions and allow continued operation with an inoperable snubber, if an evaluation of the attached component shows that this alternative is acceptable.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

Criterion 1 - Does not Involve a Significant Increase in the Probability or Consequences of an Accident Previously Evaluated.

Snubbers are installed to maintain the structural integrity of systems and components which either mitigate the consequences of an accident or failure of which may initiate a previously analyzed accident. No physical change to the facility or its operating parameters is being made. The proposed changes were developed by the NRC Staff and maintain the same confidence level as the existing visual snubber inspection schedule as specified within the Generic Letter 90-09. For these reasons, the response of the plant to previously evaluated accidents will remain unchanged. Therefore, this change does not involve an increase in the probability or consequences of an accident previously evaluated.

Criterion-2 - Does Not Create the Possibility of a New or Different Kind of Accident from any Previously Evaluated.

The proposed Technical Specification change does not change the number, type, design, function, or service life of snubbers in either Unit 1 or 2. The proposed change does not alter the configuration of the facility, plant operation, or accident analysis assumptions. Since no change is being made to degrade the design, operation, or maintenance of the plant, a new mode of failure is not created. The increase in the length of snubber visual inspection intervals and clarifications of existing visual inspection acceptance criteria have no effect on accidents. Changes to the visual inspection criteria which deviate from GL 89-09 are clarifications only and do not change the intended meaning of the criteria. The proposed TS change will maintain the snubber operability confidence level within acceptable limits. Therefore, a new or different kind of accident will not occur as a result of these changes.

Criterion 3 - Does Not Involve a Significant Reduction in the Margin of Safety.

The Surveillance Requirements set forth in Generic Letter 90-09 as alternate requirements for snubber visual inspection intervals were developed by the NRC Staff and, as addressed in Generic Letter 90-09 (including ANO's revisions), maintain the same confidence level as the present requirements. Therefore, incorporating the suggested Surveillance Requirements from Generic Letter 90-09 will not reduce any margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Local Public Document Room location: Tomlinson Library, Arkansas Tech University, Russellville, Arkansas 72801

Attorney for licensee: Nicholas S. Reynolds, Esquire, Winston and Strawn, 1400 L Street, N.W., Washington, D.C. 20005-3502

NRC Project Director: John T. Larkins

Entergy Operations, Inc., Docket Nos. 50-313 and 50-368, Arkansas Nuclear One, Unit Nos. 1 and 2 (ANO-1&2), Pope County, Arkansas

Date of amendment request: October 15, 1991

Description of amendment request: The amendment would revise the Operating Licenses (OLs) and Technical Specifications (TSs) for Arkansas Nuclear One, Unit 1 and 2 (ANO-1 & 2). The proposed changes to the OLs are to add the NRC's standard OL condition for Fire Protection. The proposed changes to the TSs will relocate the Fire Protection requirements from the TSs to the respective Safety Analysis Reports (SARs) verbatim. These changes were prepared in accordance with Generic Letters 86-10 and 88-12.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

(1) Involve a significant increase in the probability or consequences of an accident previously evaluated.

The proposed changes implement Generic Letter 86-10 and follow the guidelines given in Generic Letter 88-12. These changes are administrative, in that none of the technical requirements are being changed. The proposed changes remove the existing requirements from the TSs and place them verbatim in the SARs which are internally controlled documents. An amendment to the OLs is being added which prevents making changes to the program, which would adversely affect the ability to achieve and maintain safe shutdown without prior approval. Therefore, the proposed changes do not involve a significant increase in the probability or consequences of an accident.

(2) Create the possibility of a new or different kind of accident from any previously evaluated.

The proposed changes to the Fire Protection requirements are adminstrative in nature since no design features are being modified. Therefore, the proposed changes do not create the possibility of a new or different kind of accident from any previously evaluated.

(3) Involve a significant reduction in the margin of safety.

The technical requirements for Fire Protection have been moved from the TSs to the SARs verbatim. Design features of ANO-1 & 2 are not being changed. Because the requirements have not changed, operating and testing procedures will, other than for minor changes to reference the SAR instead of the TSs, remain the same. Plant procedures will continue to provide specific instructions for implementing the Fire Protection

requirements. Therefore, the proposed changes do not involve a significant reduction in the margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Local Public Document Room location: Tomlinson Library, Arkansas Tech University, Russellville, Arkansas 72801

Attorney for licensee: Nicholas S. Reynolds, Esquire, Winston and Strawn, 1400 L Street, N.W., Washington, D.C. 20005-3502

NRC Project Director: John T. Larkins

Georgia Power Company, Oglethorpe Power Corporation, Municipal Electric Authority of Georgia, City of Dalton, Georgia, Docket Nos. 50-321 and 50-366 Edwin I. Hatch Nuclear Plant, Units 1 and 2, Appling County, Georgia

Date of amendment request: July 15, 1991

Description of amendment request: The proposed amendments would revise Hatch Unit 1 Bases Section 3.6.B. "Reactor Vessel Temperature and Pressure" and Hatch Unit 2 Technical Specification (TS) 3/4.4.6 "Pressure/Temperature Limits" and its associated Bases. The revision of Unit 2 TS is in response to Generic Letters (GL) 88-11 and 91-01. GL 88-11 requires Regulatory Guide (RG) 1.99, Revision 2, be used in calculating nil-ductility reference temperature of reactor vessel belting materials. The reference temperature relates to pressure-temperature (P/T) limits. The deletion of the schedule for removal of Unit 2 reactor pressure vessel (RPV) surveillance capsules from the TSs is in accordance with NRC GL 91-01. The revision to Unit 2 Bases Section 3/4.4.6 is to reflect the changes in TS 3/4.4.6 and to include a brief description of the use of revised TS curves during inservice hydrostatic/leakage testing. This brief description has also been added to Unit 1 Bases Section 3.6.B.

More specifically, proposed Change One is to modify Unit 2 TS P/T curves and associated Bases to reflect the results of surveillance specimen testing and incorporates NRC guidance provided in RG 1.99, Revision 2; and to include a minor clarification to Units 1 and 2 Bases Sections. Proposed Change Two is to delete from the TSs the schedule for removal of the RPV surveillance capsules and to relocate it in Unit 2 Final Safety Analysis Report; and to change the Bases section accordingly.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below for the two changes:

Proposed Change One

1. The proposed change does not increase the probability or consequences of an accident previously evaluated based on the specimen test results (i.e., flux wires, Charpy V-Notch impact test specimens, and uniaxial tensile test specimens) removed from the Unit 2 RPV in the Fall of 1989. The proposed limits are based on the analyses of the specimens using the methods described in 10 CFR 50, Appendix H, ASTM Standard E185, and Regulatory Guide 1.99, Revision 2, and meet the requirements of 10 CFR 50, Appendix G. No plant equipment or system, other than the RPV, is affected by the proposed changes.

2. The proposed change does not create the possibility of a new or different type of accident from any accident previously evaluated, because no new modes of operation are introduced. The proposed change places new limits on pressure and temperature, thus ensuring the RPV will not fail due to brittle fracture. The new limits were calculated using approved methods and meet the requirements of 10 CFR 50, Appendix G. Therefore, the possibility of vessel failure due to incorrect operating limits is not introduced.

3. The proposed change does not significantly reduce a margin of safety, since the margin of safety is maintained by imposing new limits on RPV pressure and temperature to account for the increase in reference temperature.

Proposed Change Two

1. The proposed change does not significantly increase the probability or consequences for an accident previously evaluated because the reactor vessel material surveillance program is not affected by the proposed change. Implementation of the proposed change will delete a license requirement that is redundant to the Code of Federal Regulations. Thus, this proposed Technical Specification is considered to be administrative in nature.

2. The proposed change will not create the possibility of a new or different kind of accident from any accident previously evaluated because implementation of this change will not alter plant configuration or mode of operation. Compliance with existing regulations will ensure continued confidence in reactor vessel material properties.

3. The proposed change will not involve a significant reduction in the margin of safety because the evaluation of reactor vessel material embrittlement is not altered by this change. Additionally, Surveillance Requirement 4.4.6.1.3 and Table 4.4.6.1.3-1 are not beneficial to the primary user of the Technical Specifications (i.e., the reactor operator). Thus, deletion of this material will actually enhance the usability of the Technical Specifications by plant operators.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Local Public Document Room location: Appling County Public Library, 301 City Hall Drive, Baxley, Georgia 31513

Attorney for licensee: Ernest L. Blake, Jr., Esquire, Shaw, Pittman, Potts and Trowbridge, 2300 N Street, NW., Washington, DC 20037.

NRC Project Director: David B. Matthews

Maine Yankee Atomic Power Company, Docket No. 50-309, Maine Yankee Atomic Power Station, Lincoln County, Maine

Date of amendment request: November 15, 1991

Description of amendment request: The proposed amendment would change the Maine Yankee Security Plan to include the guidance of Regulatory Guide 5.66, Access Authorization Program for Nuclear Power Plants, dated June 1991, for cold shutdown. Specifically, Maine Yankee proposes to apply the cold shutdown provisions of Regulatory Guide 5.66 during their 1992 refueling outage, currently scheduled to begin on February 15, 1992. The proposed amendment would be restricted to the duration of the 1992 refueling outage, currently scheduled to last 8 weeks and employ approximately four hundred contracted workers.

Workers granted relaxed access authorization under the provisions of 10 CFR 73.56(i), Access Authorization Program for Nuclear Power Plants, would be issued unique key cards having a distinctive colored background and a restricted access level. These unique key cards will permit access through doors leading to the turbine hall, service building and circulating water pump house. Access through doors leading to other areas of the plant will be restricted to individuals having higher access levels. To further minimize the likelihood of inadvertent migration by these temporary workers beyond the affected area, security Watchpersons or Officers will be posted in the hallway leading to the primary auxiliary building, and to the alleyway between containment and the service building. (Current Maine Yankee Security Procedures require security Watchpersons or Officers at the containment equipment and personnel hatches when open, and at the stairway

leading to the spent fuel pool when refueling is in progress.)

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.92(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

1. The proposed amendment does not involve a significant increase in the probability or consequences of an accident previously evaluated. Maine Yankee's physical security controls will remain unchanged, but security personnel postings and tamper protection measures will be enhanced in the affected areas. The likelihood of an attempted sabotage or tampering incident is therefore believed to be minimal.

Also, because the relaxed access authorization controls are limited to operation at or below the cold shutdown operating condition—and much of the equipment and systems in the affected area will be out of service during this condition—the consequences of tampering or sabotage, should it occur, are therefore minimal. Additionally, for those systems that remain operating, the added tamper control measures, Maine Yankee security, supervisory presence on site dedicated to these temporary workers, and existing operating and abnormal operating procedures provide ample assurance that relaxed access authorization for Maine Yankee's 1992 refueling shutdown does not involve a significant increase in the probability or consequences of an accident previously evaluated.

2. The proposed amendment will not create the possibility of a new or different kind of accident from any accident previously evaluated. This change is in accordance with 10CFR 73.56(d), and does not create the possibility of a new or different accident from any previously evaluated.

3. The proposed amendment will not involve a significant reduction in a margin of safety. The relaxed access authorization rule was created, in part, because under cold shutdown conditions, it was recognized that the risk of sabotage is low when appropriate security for nuclear fuel is maintained. As described above, appropriate security controls are being maintained during Maine Yankee's 1992 refueling shutdown and this amendment therefore does not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis, and based on this review, it appears that the three standards of 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Local Public Document Room location: Wiscasset Public Library, High Street, P.O. Box 367, Wiscasset, Maine 04578

Attorney for licensee: John A. Ritsher, Esquire, Ropes and Gray, One International Place, Boston, Massachusetts 02110-2624

NRC Project Director: Walter R. Butler

Northern States Power Company, Docket No. 50-263, Monticello Nuclear Generating Plant, Wright County, Minnesota

Date of amendment request: October 21, 1991

Description of amendment request: The proposed amendment would revise the Technical Specifications (TS) to include requirements to periodically verify the operability of the reactor feedwater pump trip per the commitments made by the licensee in its response to Generic Letter 89-19 regarding overfill protection. The amendment adds limiting conditions for operation and surveillance requirements for the reactor feedwater pump trip instrumentation to the TS. Specifically, the proposed amendment makes changes to Table 3.2.8 and 4.2.1, updates the associated Bases, and makes several clarifying editorial corrections.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

(1) The proposed amendment will not involve a significant increase in the probability or consequences of an accident previously evaluated.

The overfill protection system is a commercial grade system that mitigates main feedwater overfeed events during reactor power operation. The reactor feedwater pump trip instrument limiting conditions for operation and surveillance requirements are being added to the Technical Specifications. These requirements are part of current plant practice. Other proposed changes correct or clarify existing wording.

Therefore, this amendment will not cause an increase in the probability or consequences of an accident previously evaluated for the Monticello plant.

(2) The proposed amendment will not create the possiblity of a new or different kind of accident from any accident previously analyzed.

This is an administrative change which simply adds an existing testing requirement to the Technical Specifications and makes a number of minor wording corrections. Therefore, the proposed amendment will not create the possibility of a new or different kind of accident.

(3) The proposed amendment will not involve a significant reduction in the margin of safety.

This is an administrative change which simply adds an existing testing requirement to the Technical Specifications and makes a number of minor wording changes. Therefore, this amendment will not reduce the margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Local Public Document Room location: Minneapolis Public Library, Technology and Science Department, 300 Nicollet Mall, Minneapolis, Minnesota 55401.

NRC Project Director: L. B. Marsh.

Northern States Power Company, Docket Nos. 50-282 and 50-306, Prairie Island Nuclear Generating Plant, Units Nos. 1 and 2, Goodhue County, Minnesota

Date of amendment request: October 4, 1991

Description of amendment request: The proposed amendments consist of two parts. The first part addresses the installation of a single-failure-proof crane and would revise Technical Specification Sections 3.8.B and its associated Bases to remove the restriction related to cask handling; add a new Section 4.19 and associated Bases which establish surveillance requirements for the Auxiliary Building crane lifting devices; and revise Section 5.6 to remove references to the spent fuel cask drop analysis and mitigation design features, and incorporate a new paragraph which states that spent fuel casks will be handled by a single-failure-proof handling system.

In the second part, the proposed amendments makes several changes of an administrative nature in Technical Specification Sections 3.8.B, 5.6, and in Table TS.4.1-2B in order to accommodate the Prairie Island Independent Spent Fuel Storage Installation (ISFSI) and to discuss the Bases for spent fuel boron requirements. Specifically, changes related to the ISFSI include requirements to maintain the boron concentration level, provide an action statement if boron concentration falls below required levels, and require a weekly verification of the boron concentration.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

Part 1

(1) The proposed amendment will not involve a significant increase in the probability or consequences of an accident previously evaluated.

The proposed amendment eliminates Technical Specification restrictions on cask handling that are designed to prevent or mitigate the consequences of a cask drop accident. However, in place of these existing restrictions on cask handling, the probability of a cask drop in the spent fuel pool is being significantly reduced by the upgrade of the auxiliary building crane to a single-failure-proof design in accordance with the requirements of NUREG-0612.

While the elimination of the Technical Specification restrictions on cask handling could have a significant effect on the consequences of a cask drop accident, the use of a single-failure- proof handling system will essentially eliminate the possibility of a cask drop event and thus the consequences of a cask drop event are of little concern. This conclusion is supported by the guidance in Section 5 of NUREG-0612 which specifically allows the use of a single-failure-proof handling system in place of the ability to withstand a load drop accident.

Therefore, the use of a single-failure-proof handling system for the handling of spent fuel casks and removal of the current Technical Specification restrictions on cask handling will not involve a significant increase in the probability or consequences of an accident previously evaluated.

(2) The proposed amendment will not create the possibility of a new or different kind of accident from any accident previously analyzed.

The proposed amendment eliminates Technical Specification restrictions on cask handling that are designed to prevent or mitigate the consequences of the previously analyzed cask drop accident. The upgrade of the auxiliary building crane to a single-failure-proof design and the handling of spent fuel casks with a single-failure-proof handling system will essentially eliminate the possibility of the previously analyzed cask drop accident.

There are no new failure modes or mechanisms associated with the proposed changes. The single-failure-proof handling system to be used in cask handling will be in compliance with all applicable regulatory requirements and will provide a significantly more reliable system for handling heavy loads than the current auxiliary building crane can provide.

Therefore, no different type of accident is created. No additional safety analyses are necessary. The accident analyses presented in the Updated Safety Analysis Report remain bounding.

(3) The proposed amendment will not involve a significant reduction in the margin of safety.

While the elimination of the Technical Specification restrictions on cask handling could have a significant effect on the consequences of a cask drop accident, the use of a single-failure- proof handling system will essentially eliminate the possibility of cask drop event. This significant reduction in the probability of a cask drop event will result in an increase in the plant's margin of safety.

The use of a single-failure-proof handling system which meets the requirements of NUREG-0612 ensures that the probability of a load drop is sufficiently small such that the activity release from a fuel handling accident assumed in the safety analyses will not be affected. The use of a single-failure-proof handling system for the handling of spent fuel casks and removal of the current Technical Specification restrictions on cask handling will not result in a reduction in any Technical Specification margin of safety. This conclusion is supported by the guidance in Section 5 of NUREG-0612 which specifically allows the use of a single-failure-proof handling system in place of the ability to withstand a load drop accident.

Therefore, the proposed changes will not result in any reduction in the plant's margin of safety.

Part 2

(1) The proposed amendment will not involve a significant increase in the probability or consequences of an accident previously evaluated.

The Technical Specification changes proposed by this portion of the License Amendment Request are required to accommodate the Prairie Island Independent Spent Fuel Installation and the storage of fuel in spent fuel storage casks.

Because the proposed changes are either administrative in nature or constitute additional restrictions not presently in the Technical Specifications, the proposed changes will not involve a significant increase in the probability or consequences of an accident previously evaluated.

(2) The proposed amendment will not create the possibility of a new or different kind of accident from any accident previously analyzed.

There are no new failure modes or mechanisms associated with the proposed changes. The proposed changes do not involve any modification in the operational limits or physical design of the involved systems. The change merely incorporates Technical Specification changes required to accommodate the Prairie Island Independent Spent Fuel Storage Installation and the storage of fuel in spent fuel storage casks.

The boron concentration limitations imposed by the proposed changes are consistent with the restrictions currently in the Technical Specifications to mitigate the consequences of a cask drop. Spent fuel pool boron concentration is normally maintained above the 1800 ppm limit. This new Technical Specification requirement will have no effect on plant operations.

As discussed above, the proposed changes do not result in any significant change in the configuration of the plant, equipment design or equipment use nor do they require any change in the accident analysis methodology. Therefore, no different type of accident is created. No safety analyses are affected. The accident analyses presented in the Updated Safety Analysis Report remain bounding.

(3) The proposed amendment will not involve a significant reduction in the margin of safety.

Because the proposed changes are either administrative in nature or constitute additional restrictions not presently in the Technical Specifications, the proposed changes do not involve a reduction in any Technical Specification margin of safety.

The additional restrictions imposed by the new spent fuel pool boron concentration requirements will ensure that k_{eff} for the spent fuel cask, including statistical uncertainties, will be less than or equal to 0.95 for all postulated arrangements of fuel within the cask.

Therefore, the proposed changes will not result in any reduction in the plant's margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Attorney for licensee: Jay Silberg, Esq., Shaw, Pittman, Potts, and Trowbridge, 2300 N Street, NW, Washington, DC 20037.

NRC Project Director: L. B. Marsh.

Virginia Electric and Power Company, Docket Nos. 50-338 and 50-339, North Anna Power Station, Units No. 1 and No. 2, Louisa County, Virginia

Date of amendment request: November 9, 1987, as supplemented March 31, 1988.

Description of amendment request: The proposed changes would revise the Technical Specifications (TS) for the North Anna Power Station, Units No. 1 and No. 2 (NA-1&2). The changes would reformat the operability and surveillance requirements for the intermediate range (IR) channels to be consistent with NUREG-0452, Revision 4, "Standard Technical Specifications (STS) for Westinghouse Pressurized Water Reactors" (Fall 1981), which are applicable to NA-1&2. Also, the proposed changes would revise the nominal IR high flux trip setpoint. The IR nuclear flux trips provide backup reactor core protection during reactor startup. The IR circuitry provides monitoring of the flux level over an eight decade range ($1x10^{-11}$ to $1x10^{-3}$ amperes). There is no operating condition under which the IR trip provides sole overpower protection. It is a backup trip only, and no credit is taken for the trip in the NA-1&2 Updated Final Safety Analysis Report (UFSAR). Operating experience at NA-1&2 has shown the IR channel response to be sensitive to core loading patterns, varying core burnups and control rod positions, and the variability in the channel response had made it difficult to maintain the channels in proper calibration. Therefore, the proposed change would elevate the nominal IR high flux trip

setpoint from a current equivalent to 25% of rated thermal power to a current equivalent to 35% of rated thermal power.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

[The proposed changes would not:]

1. involve a significant increase in the probability or consequences of an accident previously evaluated. There is no adverse impact on the safety analysis (since no credit is taken for the trips in the existing analyses), and no degradation of the protection system redundancy or reliability. This latter conclusion is based on sensitivity studies which show that the effectiveness of the flux trip system in protecting against the low power reactivity excursions examined in the FSAR is not sensitive to realistic variations in the actual flux trip setpoint.

2. create the probability of a new or different kind of accident from any accident previously identified, since the severity of the analyzed accidents is unchanged, and since only a change to a setpoint and the associated surveillance requirements for the reactor protection system is involved.

3. involve a significant reduction in a margin of safety, since none of the safety analysis input or assumptions are changed, nor are the probability [or] the consequences of any previously analyzed accidents increased.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

Local Public Document Room location: The Alderman Library, Special Collections Department, University of Virginia, Charlottesville, Virginia 22903-2498.

Attorney for licensee: Michael W. Maupin, Esq., Hunton and Williams, P.O. Box 1535, Richmond, Virginia 23212.

NRC Project Director: Herbert N. Berkow

Virginia Electric and Power Company, Docket Nos. 50-280 and 50-281, Surry Power Station, Unit Nos. 1 and 2, Surry County, Virginia

Date of amendment request: September 20, 1991

Description of amendment request: The proposed changes would delete the requirements for testing components prior to initiating maintenance on inoperable components in the safety injection, containment spray, recirculation spray, and auxiliary ventilation exhaust systems described in the Surry Power Station Technical Specifications (TS). With regard to the emergency diesel generators (EDGs), the redundant train testing requirement is not deleted. However, a limit is specified for the amount of time an EDG may rendered inoperable for such testing. In addition, typographical errors would be corrected on pages TS 3.3-6, TS 3.4-2, and TS 3.16-4. Also, the correct nomenclature, "system reserve transformer," would replace the obsolete term, "autotransformer," on page TS 3.16-4.

Basis for proposed no significant hazards consideration determination: As required by 10 CFR 50.91(a), the licensee has provided its analysis of the issue of no significant hazards consideration, which is presented below:

(1) Operation of the facility in accordance with the proposed amendment[s] would not involve a significant increase in the probability or consequences of an accident previously evaluated.

The design and performance criteria for the systems affected by this change are not being altered. The systems are designed to mitigate the consequences of accidents, therefore their availability has no bearing on the probability of an accident's occurrence. Also, since neither the systems themselves nor related test methods are being changed, there will be no effect on accident precursors. Therefore, this change does not increase the probability of occurrence of an accident previously evaluated.

In the cases of the Low Head Safety Injection System (T.S. 3.3), the Containment and Recirculation Spray Systems (T.S. 3.4), and the Auxiliary Ventilation Exhaust Filter Trains (T.S. 3.22), the current opposite train testing requirements have the potential for increasing consequences due to inability to perform a mitigating function since both trains have been declared inoperable (one due to failure and the other due to surveillance testing). Elimination of these requirements will serve to ensure that one train of safety equipment is always available to mitigate the consequences of a design basis accident (DBA) without increasing the rate of failure of the tested equipment. Despite a diminished likelihood of detecting a failure, should it occur during the surveillance interval when the opposite train failed, the probability of failure of the tested equipment would potentially be reduced due to a lower number of demands for performance. Furthermore, the equipment's ability to perform according to design is not adversely affected. Thus, in these cases, this change does not increase the probability or consequences of an accident previously evaluated.

In the case of the [EDGs] (T.S. 3.16), allowing two EDGs to be inoperable concurrently for a period of two hours impacts the reliability of the emergency power supply to, but not the actual, functional operability of safety systems in the event that a DBA was to occur during the period of inoperability. This relatively insignificant two-hour period of inoperability is used to determine whether or not a common mode failure of even greater significance is involved. Given that opposite train testing of an EDG would not be permitted without verifying that two offsite AC circuits are operable, this change does not involve a significant increase in the consequences of an accident previously evaluated.

(2) Use of the modified specification would not create the possibility of a new or different kind of accident from any accident previously evaluated.

As stated above, the proposed changes do not involve changes to the physical plant or operations. [These changes modify] equipment testing frequency requirements only and no new accident precursors are generated. Therefore, the proposed changes do not create the possibility of a new or different kind of accident.

(3) Use of the modified specification would not involve a significant reduction in a margin of safety.

The routine surveillance requirements which remain in the Technical Specifications, coupled with the EDG opposite train testing, provide adequate assurance of equipment operability. Since the reduction of testing may increase availability due to a lower number of challenges to the Low Head Safety Injection, the Containment and Recirculation Spray, and the Auxiliary Ventilation Exhause Filter Systems, margins of safety may be increased. In addition, because the performance of the equipment is not being changed nor is there any modification to the plant proposed by this Technical Specification change request, margins of safety associated with the equipment's ability to perform its design function will not be significantly reduced.

In addition, the changes to TS 3.3-6, TS 3.4-2 and TS 3.16-4 are administrative in nature and, therefore, do not involve a significant increase in the probability or consequences of an accident previously evaluated, would not create the possibility of a new or different kind of accident from any accident previously evaluated, and do not involve a significant reduction in a margin of safety.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 50.92(c) are satisfied. Therefore, the NRC staff proposes to determine that the amendment request involves no significant hazards consideration.

NRC Project Director: Herbert N. Berkow

Notice Of Issuance Of Amendment To Facility Operating License

During the period since publication of the last biweekly notice, the Commission has issued the following amendments. The Commission has determined for each of these amendments that the application complies with the standards and requirements of the Atomic Energy Act of 1954, as amended (the Act), and the Commission's rules and regulations. The Commission has made appropriate findings as required by the Act and the Commission's rules and regulations in 10 CFR Chapter I, which are set forth in the license amendment.

Notice of Consideration of Issuance of Amendment to Facility Operating License and Proposed No Significant Hazards Consideration Determination and Opportunity for Hearing in connection with these actions was published in the **Federal Register** as indicated. No request for a hearing or petition for leave to intervene was filed following this notice.

Unless otherwise indicated, the Commission has determined that these amendments satisfy the criteria for categorical exclusion in accordance with 10 CFR 51.22. Therefore, pursuant to 10 CFR 51.22(b), no environmental impact statement or environmental assessment need be prepared for these amendments. If the Commission has prepared an environmental assessment under the special circumstances provision in 10 CFR 51.12(b) and has made a determination based on that assessment, it is so indicated.

For further details with respect to the action see (1) the applications for amendments, (2) the amendments, and (3) the Commission's related letters, Safety Evaluations and/or Environmental Assessments as indicated. All of these items are available for public inspection at the Commission's Public Document Room, the Gelman Building, 2120 L Street, NW., Washington, D.C., and at the local public document rooms for the particular facilities involved. A copy of items (2) and (3) may be obtained upon request addressed to the U.S. Nuclear Regulatory Commission, Washington, DC 20555, Attention: Director, Division of Reactor Projects.

Baltimore Gas and Electric Company, Docket Nos. 50-317 and 50-318, Calvert Cliffs Nuclear Power Plant, Unit Nos. 1 and 2, Calvert County, Maryland

Date of application for amendments: August 27, 1991, as superseded by letter dated August 30, 1991.

Brief description of amendments: The amendments revise the Technical Specification (TS) Table 4.3-2 and adds Note 2 for both Units 1 and 2 to allow the Safety Injection Actuation Signal (SIAS) logic that starts the Emergency Diesel Generators (EDGs) to be moved to a different subchannel of the SIAS. TS Table 4.3-2, Notes 3 through 6, wording is changed from "may be" to "are." These notes identify the logic circuits which are currently exempted from testing during power operation. The change also deletes TS 3/4.6.1.8 which provides limiting conditions for operation (LCO) and surveillance requirements for the containment vent isolation valves. These interim requirements are no longer needed since additional automatic isolation signals have been provided to assure closure of the containment isolation valves.

Date of issuance: October 31, 1991.

Effective date: October 31, 1991

Amendment Nos.: 164 and 144

Facility Operating License Nos. DPR-53 and DPR-69: Amendments revised the Technical Specifications.

Date of initial notice in **Federal Register:** September 18, 1991 (56 FR 47230) The Commission's related evaluation of these amendments is contained in a Safety Evaluation dated October 31, 1991.

No significant hazards consideration comments received: No

Local Public Document Room location: Calvert County Library, Prince Frederick, Maryland.

Connecticut Yankee Atomic Power Company, Docket No. 50-213, Haddam Neck Plant, Middlesex County, Connecticut

Date of application for amendment: August 13, 1991

Brief description of amendment: The amendment will allow temporary cooling of the operable emergency diesel generator in MODE 6 using alternate means while service water modifications to the emergency diesel generator heat exchangers are being performed during the upcoming refueling outage (Cycle 17).

Date of Issuance: November 7, 1991

Effective date: November 7, 1991

Amendment No.: 145

Facility Operating License No. DPR-61. Amendment revised the Technical Specifications.

Date of initial notice in **Federal Register:** September 4, 1991 (56 FR 43807) The Commission's related evaluation of this amendment is contained in a Safety Evaluation dated November 7, 1991.

No significant hazards consideration comments received: No.

Local Public Document Room location: Russell Library, 123 Broad Street, Middletown, Connecticut 06457.

Duke Power Company, et al., Docket Nos. 50-413 and 50-414, Catawba Nuclear Station, Units 1 and 2, York County, South Carolina

Date of application for amendments: October 28, 1987, as supplemented June 18, 1991

Brief description of amendments: The amendments revise the Technical Specifications with four changes that are editorial in nature, corrections of typographical errors, and clarifications.

Date of issuance: November 4, 1991

Effective date: November 4, 1991

Amendment Nos.: 91, 85

Facility Operating License Nos. NPF-35 and NPF-52: Amendments revised the Technical Specifications.

Date of initial notice in **Federal Register:** November 15, 1989 (54 FR 47601) and August 21, 1991 (56 FR 41579) The Commission's related evaluation of the amendments is contained in a Safety Evaluation dated November 4, 1991.

No significant hazards consideration comments received: No.

Local Public Document Room location: York County Library, 138 East Black Street, Rock Hill, South Carolina 29730

Duke Power Company, Docket Nos. 50-369 and 50-370, McGuire Nuclear Station, Units 1 and 2, Mecklenburg County, North Carolina

Date of application for amendments: April 18, 1991

Brief description of amendments: The amendments revise Technical Specification 5.3.1 to enable the use of two demonstration assemblies during McGuire Unit 1 Cycle 8, 9 and 10.

Date of issuance: October 31, 1991

Effective date: October 31, 1991

Amendment Nos.: 127, 109

Facility Operating License Nos. NPF-9 and NPF-17: Amendments revised the Technical Specifications.

Date of initial notice in **Federal Register:** June 12, 1991 (56 FR 27041) The Commission's related evaluation of the amendments is contained in an Environmental Assessment dated September 16, 1991, and in a Safety Evaluation dated October 31, 1991.

No significant hazards consideration comments received: No.

Local Public Document Room location: Atkins Library, University of North Carolina, Charlotte (UNCC Station), North Carolina 28223

Entergy Operations, Inc., Docket No. 50-313, Arkansas Nuclear One, Unit No. 1, Pope County, Arkansas

Date of amendment request: June 27, 1991, as supplemented August 22, October 4, and October 16, 1991.

Brief description of amendment: The amendment revised the Technical Specifications for Arkansas Nuclear One, Unit 1, to allow a 17-ton shipping cask with two spent fuel rods to be handled for shipping by the auxiliary building crane during the period from October 15, 1991, through January 31, 1991.

Date of issuance: November 6, 1991

Effective date: November 6, 1991

Amendment No.: 153

Facility Operating License No. DPR-51. Amendment revised the Technical Specifications.

Date of initial notice in **Federal Register:** August 7, 1991 (56 FR 37581) The August 22, October 4, and October 16, 1991, letters provided clarifying information that did not change the initial proposed no significant hazards consideration determination.

The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated November 6, 1991.

No significant hazards consideration comments received: No.

Local Public Document Room location: Tomlinson Library, Arkansas Tech University, Russellville, Arkansas 72801

Entergy Operations, Inc., Docket No. 50-282, Waterford Steam Electric Station, Unit 3, St. Charles Parish, Louisiana

Date of amendment request: September 25, 1991

Brief description of amendment: The amendment revised the Technical Specifications by adding a note to the emergency diesel generator test frequency table to not require the test failure on August 20, 1991, to count for adjustment of test frequency of the "A" diesel generator.

Date of issuance: November 1, 1991

Effective date: November 1, 1991

Amendment No.: 71

Facility Operating License No. NPF-38. Amendment revised the Technical Specifications.

Date of initial notice in **Federal Register:** October 1, 1991 (56 FR 49802) The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated November 1, 1991.

No significant hazards consideration comments received: No.

Local Public Document Room location: University of New Orleans Library, Louisiana Collection, Lakefront, New Orleans, Louisiana 70122.

Georgia Power Company, Oglethorpe Power Corporation, Municipal Electric Authority of Georgia, City of Dalton, Georgia, Docket Nos. 50-321 and 50-366, Edwin I. Hatch Nuclear Plant, Units 1 and 2, Appling County, Georgia

Date of application for amendments: April 12, 1991

Brief description of amendments: The amendments change the TSs for Units 1 and 2 to conform to the NRC staff position on Inservice Inspection (ISI) in Generic Letter (GL) 88-01, "NRC Position on IGSCC in BWR Austenitic Stainless Steel Piping," and NRC Safety Evaluation dated February 16, 1990.

Date of issuance: November 1, 1991

Effective date: 60 days from the date of issuance

Amendment Nos.: 176 & 117

Facility Operating License Nos. DPR-57 and NPF-5. Amendments revised the Technical Specifications.

Date of initial notice in **Federal Register:** June 26, 1991 (56 FR 29275) The Commission's related evaluation of the amendments is contained in a Safety Evaluation dated November 1, 1991

No significant hazards consideration comments received: No.

Local Public Document Room location: Appling County Public Library, 301 City Hall Drive, Baxley, Georgia 31513

Georgia Power Company, Oglethorpe Power Corporation, Municipal Electric Authority of Georgia, City of Dalton, Georgia, Docket Nos. 50-424 and 50-425, Vogtle Electric Generating Plant, Units 1 and 2, Burke County, Georgia

Date of application for amendments: August 14, 1990

Brief description of amendments: The amendments change the Technical Specifications to delete the Negative Flux Rate Trip (NFRT) function from tables specifying Reactor Trip System instrumentation requirements.

Date of issuance: November 1, 1991

Effective date: Phase 1 effective beginning with Unit 1 Cycle 4; Phase 2 effective beginning with Unit 2 Cycle 3

Amendment Nos.: 48 and 27 (Phase 1); 49 and 28 (Phase 2)

Facility Operating License Nos. NPF-68 and NPF-81: Amendments revised the Technical Specifications.

Date of initial notice in **Federal Register:** May 1, 1991 (56 FR 20035) The Commission's related evaluation of the amendments is contained in a Safety Evaluation dated November 1, 1991.

No significant hazards consideration comments received: No.

Local Public Document Room location: Burke County Library, 412 Fourth Street, Waynesboro, Georgia 30830

Gulf States Utilities Company, Docket No. 50-458, River Bend Station, Unit 1 West Feliciana Parish, Louisiana

Date of amendment request: August 20, 1991, as supplemented by letters dated February 13, 1991, April 11, 1991, and August 9, 1991.

Brief description of amendment: The amendment revises Technical Specification 6.5.1, "Facility Review Committee," and 6.5.3, "Nuclear Review Board," by deleting the specific composition list for each and replacing it with general statements defining the number of members and the level of expertise for membership. Additional changes include qualification of alternate members, definition of a quorum, and deletion of a reference to the first year of plant operation that has been completed.

Date of issuance: November 6, 1991

Effective date: November 6, 1991, to be implemented 30 days from date of issuance.

Amendment No.: Amendment No. 61

Facility Operating License No. NPF-47. The amendment revised the Technical Specifications.

Date of initial notice in **Federal Register:** October 3, 1990 (55 FR 40466) The February 13, 1991, submittal requested partial withdrawal of the original amendment request. A Notice of Withdrawal of Application for Amendment was published on April 11, 1991 (56 FR 14718). The April 11, 1991, and August 9, 1991, submittals provided additional clarifying information and did not change the initial no significant hazards consideration determination. The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated November 6, 1991.

No significant hazards consideration comments received: No.

Local Public Document Room location: Government Documents Department, Louisiana State University, Baton Rouge, Louisiana 70803

Houston Lighting & Power Company, City Public Service Board of San Antonio, Central Power and Light Company, City of Austin, Texas, Docket Nos. 50-498 and 50-499, South Texas Project, Units 1 and 2, Matagorda County, Texas

Date of amendment request: December 21, 1990, as supplemented by letter dated October 15, 1991.

Brief description of amendments: The amendments revised TS 3.4.9.3 to remove a conflict between it and TS 4.0.5. The change will permit full operability testing of an inoperable

pressurizer PORV following maintenance on the PORVs.

Date of issuance: November 8, 1991

Effective date: November 8, 1991

Amendment Nos.: 31 and 22

Facility Operating License Nos. NPF-76 and NPF-80. Amendment revised the Technical Specifications.

Date of initial notice in **Federal Register:** October 2, 1991 (56 FR 49918) The October 15, 1991, submittal provided additional clarifying information and did not change the initial no significant hazards consideration determination. The Commission's related evaluation of the amendments is contained in a Safety Evaluation dated November 8, 1991.

No significant hazards consideration comments received: No.

Local Public Document Room Location: Wharton County Junior College, J. M. Hodges Learning Center, 911 Boling Highway, Wharton, Texas 77488

Nebraska Public Power District, Docket No. 50-298, Cooper Nuclear Station, Nemaha County, Nebraska

Date of amendment request: April 23, 1991, as supplemented November 4, 1991

Brief description of amendment: The amendment changed the Technical Specifications to: 1) permit the use of certain NRC-approved neutron absorber materials in control rods, 2) require that Monthly Operating Reports be submitted in the manner specified in 10 CFR 50.4 and no later than the 15th day of the following month, and 3) make editorial changes that reflect the change of title of the "Safety Analysis Report" to the "Updated Safety Analysis Report."

Date of issuance: November 6, 1991

Effective date: November 6, 1991

Amendment No.: 149

Facility Operating License No. DPR-46. Amendment revised the Technical Specifications.

Date of initial notice in **Federal Register:** May 29, 1991 (56 FR 24212) The additional information contained in the supplemental letter dated November 4, 1991, was clarifying in nature and thus within the scope of the initial notice and did not affect the NRC staff's proposed no significant hazards consideration determination. The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated November 6, 1991.

No significant hazards consideration comments received: No.

Local Public Document Room location: Auburn Public Library, 118 15th Street, Auburn, Nebraska 68305.

Public Service Electric & Gas Company, Docket No. 50-354, Hope Creek Generating Station, Salem County, New Jersey

Date of application for amendment: September 6, 1991

Brief description of amendment: This amendment changed the channel functional test surveillance intervals for the Reactor Protection System (RPS) Electrical Protective Assemblies (EPAs) and Power Range Neutron Monitoring System EPAs from "at least once per 6 months" to "each time the plant is in cold shutdown for a period of more than 24 hours, unless performed in the previous 6 months." This change to the surveillance intervals is in accordance with the guidance contained in Generic Letter 91-09.

Date of issuance: November 5, 1991

Effective date: As of the date of issuance and shall be implemented within sixty days of the date of issuance.

Amendment No. 44

Facility Operating License No. NPF-57. This amendment revised the Technical Specifications.

Date of initial notice in **Federal Register:** October 2, 1991 (56 FR 49925) The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated November 5, 1991.

No significant hazards consideration comments received: No

Local Public Document Room location: Pennsville Public Library, 190 S. Broadway, Pennsville, New Jersey 08070

Tennessee Valley Authority, Docket Nos. 50-259, 50-260 and 50-296, Browns Ferry Nuclear Plant, Units 1, 2, and 3, Limestone County, Alabama

Date of application for amendment: September 13, 1991 (TS-299)

Brief description of amendment: Technical specifications surveillance frequency requirements for certain logic signal functional tests were extended from six months to 18 months.

Date of issuance: November 4, 1991

Effective date: November 4, 1991

Amendment No.: 186 - Unit 1; 199 - Unit 2; 158 - Unit 3

Facility Operating License Nos. DPR-33, DPR-52 and DPR-68: Amendments revise the technical specifications.

Date of initial notice in **Federal Register:** October 2, 1991 (56 FR 49927) The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated November 4, 1991.

No significant hazards consideration comments received: None

Local Public Document Room location: Athens Public Library, South Street, Athens, Alabama 35611.

TU Electric Company, Docket No. 50-445, Comanche Peak Steam Electric Station, Unit 1, Somervell County, Texas

Date of amendment request: October 1, 1991

Brief description of amendment: The amendment revises Technical Specification Surveillance 4.5.2.h by lowering the minimum centrifugal charging pump and high head safety injection pump flow rate surveillance acceptance criteria. The purpose for the change is to avoid pump operation at flow rates exceeding runout limits for the pumps.

Date of Issuance: November 13, 1991

Effective date: November 13, 1991, to be implemented with 30 days of issuance

Amendment No.: Amendment No. 7

Facility Operating License No. NPF-87. Amendment revised the Technical Specifications.

Date of initial notice in **Federal Register:** October 9, 1991 (56 FR 50956) The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated November 13, 1991.

No significant hazards consideration comments received: No.

Local Public Document Room Location: University of Texas at Arlington Library, Government Publications/Maps, 701 South Cooper, P. O. Box 19497, Arlington, Texas 76019.

Wisconsin Public Service Corporation, Docket No. 50-305, Kewaunee Nuclear Power Plant, Kewaunee County, Wisconsin

Date of application for amendment: June 4, 1991, as supplemented September 4 and September 27, 1991.

Brief description of amendment: The amendment revised Technical Specification (TS) Section 4.13, "Radioactive Materials Sources," and TS Table 3.5-2, "Instrument Operation Conditions for Reactor Trip." The revisions added a new radiation calibrator and fission detectors to the list of sealed sources which are exempt from periodic leak testing, stated that fission detectors shall be leak tested prior to being subjected to core flux, and described the P-6 permissive set point in percent power consistent with the readout of the new fission detectors. Administrative changes are also included.

Date of issuance: November 12, 1991

Effective date: November 12, 1991

Amendment No.: 94

Facility Operating License No. DPR-43. Amendment revised the Technical Specifications.

Date of initial notice in **Federal Register:** August 7, 1991 (56 FR 37594) The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated November 12, 1991. No significant hazards consideration comments received: No.

Local Public Document Room location: University of Wisconsin Library Learning Center, 2420 Nicolet Drive, Green Bay, Wisconsin 54301.

Wolf Creek Nuclear Operating Corporation, Docket No. 50-482, Wolf Creek Generating Station, Coffey County, Kansas

Date of amendment request: June 21, 1991, as supplemented by letter dated September 11, 1991

Brief description of amendment: The amendment revises Technical Specification 4.6.2.3, "Containment Cooling System," and affected Technical Specification Bases to reduce the minimum required cooling water flow to the containment cooling units during accident conditions. The amendment also changes a monthly surveillance from a verification of flow to the coolers to a verification of valve alignment in order to ensure the coolers will perform their safety function.

Date of Issuance: November 4, 1991

Effective date: November 4, 1991

Amendment No.: Amendment No. 50

Facility Operating License No. NPF-42. Amendment revised the Technical Specifications.

Date of initial notice in **Federal Register:** August 7, 1991 (56 FR 37596) The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated November 4, 1991. The September 11, 1991 letter provided clarifying information and an additional surveillance requirement to the proposed Technical Specification that did not change the initial proposed no significant hazards consideration determination.

No significant hazards consideration comments received: No.

Local Public Document Room Locations: Emporia State University, William Allen White Library, 1200 Commercial Street, Emporia, Kansas 66801 and Washburn University School of Law Library, Topeka, Kansas 66621

Wolf Creek Nuclear Operating Corporation, Docket No. 50-482, Wolf Creek Generating Station, Coffey County, Kansas

Date of amendment request: March 5, 1991

Brief description of amendment: The amendment changes the Reactor Coolant System thermal design flow from the current Technical Specification value of 95,700 gpm/loop to a new value of 93,750 gpm/loop. Other Technical Specification changes related to the reduced thermal design flow include an increase in the setpoint of the pressurizer-pressure-low reactor trip system instrumentation, revision of Figure 2.1-1, reactor core safety limits, and various changes to the Bases to reflect the reduction in thermal design flow and utilization of a different critical heat flux correlation.

Date of Issuance: November 6, 1991

Effective date: November 6, 1991

Amendment No.: Amendment No. 51

Facility Operating License No. NPF-42. Amendment revised the Technical Specifications.

Date of initial notice in **Federal Register:** April 3, 1991 (56 FR 13673) The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated November 6, 1991.

No significant hazards consideration comments received: No.

Local Public Document Room Locations: Emporia State University, William Allen White Library, 1200 Commercial Street, Emporia, Kansas 66801 and Washburn University School of Law Library, Topeka, Kansas 66621

Wolf Creek Nuclear Operating Corporation, Docket No. 50-482, Wolf Creek Generating Station, Coffey County, Kansas

Date of amendment request: June 11, 1991 as supplemented by letters dated August 30, 1991, and September 20, 1991.

Brief description of amendment: The amendment revises Technical Specification Tables 2.2.1 and 4.3.1 and associated Bases to reflect the replacement of the existing resistance temperature detector (RTD) bypass system with an RTD thermowell system.

Date of Issuance: November 7, 1991

Effective date: November 7, 1991

Amendment No.: Amendment No. 52

Facility Operating License No. NPF-42. Amendment revised the Technical Specifications.

Date of initial notice in **Federal Register:** August 7, 1991 (56 FR 37395) The August 30, 1991, and September 20, 1991, submittals provided additional clarifying information and did not change the initial no significant hazards consideration determination. The Commission's related evaluation of the amendment is contained in a Safety Evaluation dated November 7, 1991.

No significant hazards consideration comments received: No.

Local Public Document Room Locations: Emporia State University, William Allen White Library, 1200 Commercial Street, Emporia, Kansas 66801 and Washburn University School of Law Library, Topeka, Kansas 66621

BILLING CODE 7590-01-D

[Docket No. 50-54]

Cintichem, Inc., Research Reactor; Order Authorizing Dismantling of Facility and Disposition of Component Parts

By application dated October 19, 1990, as supplemented on January 11, 14, 28, February 19, March 8, April 24, May 21, June 25, July 17, August 6, and October 2, 1991, Cintichem, Incorporated (the licensee) requested authorization to dismantle the research reactor, Facility Operating License No. R-81, located in Tuxedo, New York and to dispose of the component parts, in accordance with the plan submitted as part of the application. A "Proposed Issuance of Orders Authorizing Disposition of Component Parts and Terminating Facility License" was published in the **Federal Register** on January 14, 1991 (56 FR 1422). A petition for leave to intervene was filed by the New York State Department of Environmental Conservation (NYSDEC) on February 14, 1991, but was withdrawn by NYSDEC on March 13, 1991, after a cooperation agreement was entered into between NYSDEC and the staff of the Commission covering NYSDEC's involvement in respect to the decommissioning activities.

The U.S. Nuclear Regulatory Commission (the Commission) has reviewed the application with respect to the provisions of the Commission's rules and regulations and has found that the dismantling and disposal of component parts as stated in the licensee's dismantling plan will be consistent with the regulations in 10 CFR chapter I, and will not be inimical to the common defense and security or to the health and safety of the public. The basis of these findings is set forth in the concurrently issued Safety Evaluation by the Office of Nuclear Reactor Regulation.

The Commission has prepared an Environmental Assessment and Finding of No Significant Impact for the proposed action. Based on that Assessment, the Commission has determined that the proposed action will not result in any significant environmental impact and that an environmental impact statement need not be prepared. (56 FR 58589 November 20, 1991)

Accordingly, it is ordered that the licensee is authorized to dismantle the reactor facility and dispose of the component parts as outlined in appendix A attached to this Order. The Technical and Environmental Specifications that are applicable during the decommissioning period are in appendix B attached to this Order.

After completion of the dismantling and disposal, the licensee will submit a report on the radiation survey it has performed to confirm that radiation and surface contamination levels in the facility area satisfy the values specified in the dismantling plan and in the Commission's guidance. Following an inspection by representatives of the Commission to verify the radiation and contamination levels in the facility, consideration will be given to issuance of a further order terminating Facility Operating License No. R–81.

For further details with respect to this action, see (1) the licensee's application for authorization to dismantle the facility and dispose of component parts, dated October 19, 1990, as supplemented on January 11, 14, 28, February 19, March 8, April 24, May 21, June 25, July 17, August 6, and October 2, 1991; (2) the Commission's related Safety Evaluation; and (3) the Environmental Assessment and Finding of No Significant Impact. These items are available for public inspection at the Commission's Public Document Room, 2120 L Street NW., Washington, DC. Copies of items (2) and (3) may be obtained upon request addressed to the U.S. Nuclear Regulatory Commission, Washington, DC 20555, Attention: Director, Division of Advanced Reactors and Special Projects.

Dated at Rockville, Maryland this 21st day of November 1991.

For the Nuclear Regulatory Commission.

Dennis M. Crutchfield, Director,

Division of Advanced Reactors and Special Projects, Office of Nuclear Reactor Regulation.

[FR Doc. 91–28457 Filed 11–26–91; 8:45 am]

BILLING CODE 7590–01–M

[Docket No. 50–483]

Union Electric Co.; Consideration of Issuance of Amendment to Facility Operating License, Proposed No Significant Hazards Consideration Determination, and Opportunity for Hearing

The U.S. Nuclear Regulatory Commission (the Commission) is considering issuance of an amendment to Facility Operating License No. NPF–30, issued to Union Electric Company (the licensee), for operation of the Callaway Plant, Unit No. 1 located in Callaway County, Missouri.

The amendment would correct the Callaway Technical Specification (TS) Surveillance Requirement 4.8.1.1.2.F.(2) by (deleting the reference to a value "greater than or equal to 1352 kW" as a criterion for an acceptable emergency diesel generator (EDG) load rejection test. That value was derived from sizing design calculations and is not representative of the largest single load on the diesel under design basis conditions. The revised requirement would reflect the criteria that have been used to demonstrate the capability of the EDGs to withstand the rejection of the largest load; namely, that voltage and frequency can be maintained within specified limits.

The proposed amendment is necessary in order to bring the current surveillance test into full, literal compliance with the TSs. The tests as conducted have been consistent with the licensing basis for the facility and have conformed with NRC Regulatory Guides 1.9 and 1.108.

Before issuance of the proposed license amendment, the Commission will have made findings required by the Atomic Energy Act of 1954, as amended (the Act) and the Commission's regulations.

The Commission has made a proposed determination that the amendment request involves no significant hazards consideration. Under the Commission's regulations in 10 CFR 50.92, this means that operation of the facility in accordance with the proposed amendment would not (1) involve a significant increase in the probability or consequences of an accident previously evaluated; or (2) create the possibility of a new or different kind of accident from any accident previously evaluated; or (3) involve a significant reduction in a margin of safety.

The licensee has provided an evaluation indicating that the proposed change does not involve a significant hazards consideration under the Commission's regulations in 10 CFR 50.92 as follows:

The proposed change does not involve a significant hazards consideration because operation of Callaway Plant in accordance with this change would not:

(1) Involve a significant increase in the probability or consequences of an accident previously evaluated.

The load rejection surveillance test in question is taken from Regulatory Guide 1.9, Revision 1, Position C.5 and Regulatory Guide 1.108, Revision 1, Position C.2.a.(4) which call for a test of the loss of the largest single load. This surveillance test is performed at Callaway by disconnecting an ESW pump motor with the ESW and AC power systems aligned in their emergency operation modes. Currently there is no direct way to assure that this rejected load equals the 1352 kW listed in the Technical Specifications. However, the actual kW load associated with the ESW pump motors is less than 1352 kW and can vary slightly depending on plant conditions and motor efficiency. This variance is insignificant as assured by the preventive maintenance program that monitors pump/driver performance. Therefore, there should be no listed value for this load in the Technical Specifications nor is one needed to satisfy the regulatory guide requirements. The intended requirement is to assure that the diesel meets the specified acceptance criteria given the rejection of the ESW pump motor load when the plant is in a lineup representative of emergency conditions at Callaway.

No new design requirements are being imposed on any plant systems or components. There is no change to the 12 second diesel start time assumed in the accident analyses and verified by Technical Specification 4.8.1.1.2.a.(4) nor is there is a change to the acceptance criteria for any of the diesel generator surveillance tests, including the startup, rated load, and load rejection tests. There will be no effect on the capability of the diesel generators to supply the loads assumed in the mitigation of the accidents analyzed in FSAR Chapter 15.

(2) Create the possibility of a new or different kind of accident from any previously evaluated.

The proposed change does not involve any design changes or hardware modifications nor will there be any changes to the intended manner of plant operation or in the method by which any safety-related plant system performs its safety function. No new accident initiators, transient precursors, failure

mechanisms, or limiting single failures are introduced as a result of this change.

(3) Involve a significant reduction in a margin of safety.

The requirement to test for the loss of the single largest load will continue to be satisfied given the approval of this amendment application. The proposed change does not alter the manner in which safety limits or limiting safety system settings are determined. The proposed change will have no effect on those plant systems necessary to assure the accomplishment of protection functions and meet the accident analysis acceptance criteria in FSAR Chapter 15. There will be no impact on DNBR limits, F_Q, F-delta-H, LOCA PCT, or any other defined safety margin.

The NRC staff has reviewed the licensee's analysis and, based on this review, it appears that the three standards of 10 CFR 50.92(c) are satisfied.

Accordingly, the Commission proposes to determine that this change does not involve a significant hazards consideration.

The Commission is seeking public comments on this proposed determination. Any comments received within fifteen (15) days after the date of publication of this notice will be considered in making any final determination. The Commission will not normally make a final determination unless it receives a request for a hearing.

Written comments may be submitted by mail to the Regulatory Publications Branch, Division of Freedom of Information and Publications Services, Office of Administration, U.S. Nuclear Regulatory Commission, Washington, DC 20555, and should cite the publication date and page number of this **Federal Register** notice. Written comments may also be delivered to room P–223, Phillips Building, 7920 Norfolk Avenue, Bethesda, Maryland, from 7:30 a.m. to 4:15 p.m. Copies of written comments received may be examined at the NRC Public Document Room, the Gelman Building, 2120 L Street, NW., Washington, DC. The filing of requests for hearing and petitions for leave to intervene is discussed below.

By December 27, 1991, the licensee may file a request for a hearing with respect to issuance of the amendment to the subject facility operating license and any person whose interest may be affected by this proceeding and who wishes to participate as a party in the proceeding must file a written request for hearing and a petition for leave to intervene. Requests for a hearing and petitions for leave to intervene shall be filed in accordance with the Commission's "Rules of Practice for Domestic Licensing Proceedings" in 10 CFR part 2. Interested persons should consult a current copy of 10 CFR 2.714 which is available at the Commission's Public Document Room, the Gelman Building, 2120 L Street, NW., Washington, DC 20555 and at the Local Public Document Room located at the Callaway County Public Library, 710 Court Street, Fulton, Missouri 65251. If a request for a hearing or petition for leave to intervene is filed by the above date, the Commission or an Atomic Safety and Licensing Board, designated by the Commission or by the Chairman of the Atomic Safety and Licensing Board Panel, will rule on the request and/or petition; and the Secretary or the designated Atomic Safety and Licensing Board will issue a notice of hearing or an appropriate order.

As required by 10 CFR 2.714, a petition for leave to intervene shall set forth with particularity the interest of the petitioner in the proceeding, and how that interest may be affected by the results of the proceeding. The petition should specifically explain the reasons why intervention should be permitted with particular reference to the following factors: (1) The nature of the petitioner's right under the Act to be made a party to the proceeding; (2) the nature and extent of the petitioner's property, financial, or other interest in the proceeding; and (3) the possible effect of any order which may be entered in the proceeding on the petitioner's interest. The petition should also identify the specific aspect(s) of the subject matter of the proceeding as to which petitioner wishes to intervene. Any person who has filed a petition for leave to intervene or who has been admitted as a party may amend the petition without requesting leave of the Board up to fifteen (15) days prior to the first pre-hearing conference scheduled in the proceeding, but such an amended petition must satisfy the specificity requirements described above.

Not later than fifteen (15) days prior to the first prehearing conference scheduled in the proceeding, a petitioner shall file a supplement to the petition to intervene, which must include a list of the contentions that are sought to be litigated in the matter. Each contention must consist of a specific statement of the issue of law or fact to be raised or controverted. In addition, the petitioner shall provide a brief explanation of the bases of the contention and a concise statement of the alleged facts or expert opinion which support the contention and on which the petitioner intends to rely in proving the contention at the hearing. The petitioner must also provide references to those specific sources and documents of which the petitioner is aware and on which the petitioner intends to rely to establish those facts or expert opinion. Petitioner must provide sufficient information to show that a genuine dispute exists with the applicant on a material issue of law or fact. Contentions shall be limited to matters within the scope of the amendment under consideration. The contention must be one which, if proven, would entitle the petitioner to relief. A petitioner who fails to file such a supplement which satisfies these requirements with respect to at least one contention will not be permitted to participate as a party.

Those permitted to intervene become parties to the proceeding, subject to any limitations in the order granting leave to intervene, and have the opportunity to participate fully in the conduct of the hearing, including the opportunity to present evidence and cross-examine witnesses.

If the amendment is issued before the expiration of 30 days, the Commission will make a final determination on the issue of no significant hazards considerations. If a hearing is requested, the final determination will serve to decide when the hearing is held.

If the final determination is that the amendment request involves a no significant hazards consideration, the Commission may issue the amendment and make it immediately effective, notwithstanding the request for a hearing. Any hearing held would take place after issuance of the amendment.

If the final determination is that the amendment request involves a significant hazards consideration, any hearing held would take place before the issuance of any amendment.

Normally, the Commission will not issue the amendment until the expiration of the 15-day notice period. However, should circumstances change during the notice period, such that failure to act in a timely way would result, for example, in derating or shutdown of the facility, the Commission may issue the license amendment before the expiration of the 15-day notice period, provided that its final determination is that the amendment involves no significant hazards considerations. The final determination will consider all public and State comments received. Should the Commission take this action, it will publish in the **Federal Register** a notice of issuance. The Commission expects that the need to take this action will occur very infrequently.

A request for a hearing or a petition for leave to intervene must be filed with the Secretary of the Commission, U.S. Nuclear Regulatory Commission, Washington, DC 20555, Attention: Docketing and Service Branch, or may be delivered to the Commission's Public Document Room, the Gelman Building, 2120 L Street, NW., Washington, DC, by the above date. Where petitions are filed during the last ten (10) days of the notice period, it is requested that the petitioner promptly so inform the Commission by a toll-free telephone call to Western Union at 1 (800) 325-6000 (in Missouri 1 (800) 342-6700). The Western Union operator should be given Datagram Identification Number 3737 and the following message addressed to John N. Hannon: petitioner's name and telephone number; date petition was mailed; plant name; and publication date and page number of this **Federal Register** notice. A copy of the petition should also be sent to the Office of the General Counsel, U.S. Nuclear Regulatory Commission, Washington, DC 20555, and to Gerald Charnoff, Esq. and Thomas A. Baxter, Esq., Shaw, Pittman, Potts and Trowbridge, 2300 N Street, NW., Washington, DC 20037, attorney for the licensee.

Nontimely filings of petitions for leave to intervene, amended petitions, supplemental petitions and/or requests for hearing will not be entertained absent a determination by the Commission, the presiding officer or the presiding Atomic Safety and Licensing Board that the petition and/or request should be granted based upon a balancing of the factors specified in 10 CFR 2.714(a)(1)(i)–(v) and 2.714(d).

For further details with respect to this action, see the application for amendment dated November 15, 1991, which is available for public inspection at the Commission's Public Document Room, the Gelman Building, 2120 L Street, NW., Washington, DC 20555, and at the Local Public Document Room, located at the Callaway County Public Library, 710 Court Street, Fulton, Missouri 65251.

Dated at Rockville, Maryland, this 20th day of November 1991.

For the Nuclear Regulatory Commission.

James R. Hall, Sr.,

Project Manager, Project Directorate III–3; Division of Reactor Projects III/IV/V, Office of Nuclear Reactor Regulation.

[FR Doc. 91–28458 Filed 11–26–91; 8:45 am]

BILLING CODE 7590–01–M

[Docket No. 30–03255, License No. 42–00084–06 EA 91–157]

In the Matter of Department of Veterans Affairs; Houston, TX; Confirmatory Order Modifying License (Effective Immediately)

I

The Department of Veterans Affairs (Licensee) is the holder of NRC License No. 42–00084–06 issued by the Nuclear Regulatory Commission (NRC or Commission) pursuant to 10 CFR parts 30 & 35. The license authorizes the Licensee to possess and use a variety of radioisotopes in medical research, diagnosis and therapy at the Veterans Administration Medical Center (VAMC) in Houston, Texas. The license was most recently amended in its entirety on February 25, 1991, and was due to expire on August 31, 1991. The Licensee has submitted a timely application for the renewal of the license.

II

As indicated in the Notice of Violation and Proposed Imposition of Civil Penalty ($25,000) issued to the Licensee on this same date, a June 10–12 and June 18–20, 1991 inspection of this Licensee's NRC-licensed activities disclosed 22 violations of NRC radiation safety regulations and license commitments. In April 1990, NRC issued a Notice of Violation and Proposed Imposition of Civil Penalty ($7,500) as a result of similar inspection findings. On May 10, 1990, the licensee paid this civil penalty. Inspection findings of this nature in successive inspections reduce NRC's confidence in the VAMC's ability to manage its NRC-license activities in a manner consistent with NRC's expectations of a holder of a broad-scope medical license.

At an enforcement conference conducted at the VAMC on August 9, 1991, the Licensee made a number of commitments to take action to resolve what the NRC perceived as fundamental weaknesses in the management of the Licensee's radiation safety program. Among the Licensee's planned corrective actions was a program of quarterly audits of its NRC-licensed programs to be conducted by representatives of the Department of Veterans Affairs (DVA) National Advisory Committee on Radiation Safety.

III

A. By letters dated August 13 and 28, 1991, the Licensee agreed that DVA's National Advisory Committee on Radiation Safety (Advisory Committee) will:

1. Direct audits of the Licensee's NRC-licensed activities;

2. Establish standards for the audit process and submit such standards, and the credentials of the auditors, to NRC Region IV for its approval;

3. Direct six audits at calendar quarterly intervals within 18 months of the date of this Order;

4. Provide written audit reports, including recommended corrective actions for findings identified during the audits, to the Licensee within two weeks of each audit;

5. Provide written audit reports to NRC Region IV within two weeks of each audit; and

6. Evaluate the Licensee's written responses to the audit findings (see paragraph B.1.).

B. By letter dated August 13, 1991, the Licensee agreed that: The Licensee will provide written responses to the Advisory Committee's audit findings, including corrective actions for deficiencies identified during each audit, and measures to prevent recurrence of similar deficiencies.

The NRC staff has reviewed the Licensee's submittal and agrees that conduct of the audits would contribute to providing additional assurance that licensed activities at the VAMC will be carried out in accordance with NRC regulations and license commitments.

I find that the Licensee's commitments as set forth in its letters of August 13 and 28, 1991, are acceptable and necessary and conclude that with these commitments the public health and safety are reasonably assured. In view of the foregoing, I have determined that the public health, safety, and interest require that the Licensee's commitments in its August 13 and 28, 1991, letters be confirmed by this Order. The licensee has agreed to this action. Pursuant to 10 CFR 2.202, I have also determined that the public health, safety, and interest require that this Order be immediately effective.

IV

Accordingly, pursuant to sections 81, 161b, 161c, 161i, 161o, 182 and 186 of the Atomic Energy Act of 1954, as amended, and the Commission's regulations in 10 CFR 2.202 and 10 CFR parts 30 and 35, *it is hereby ordered,* effective immediately, that license no. 42–00084–06 is modified as follows:

A. The Licensee shall have DVA's National Advisory Committee on Radiation Safety (Advisory Committee):

1. Direct audits of the Licensee's NRC-licensed activities;

2. Establish standards for the audit process and submit such standards, and

the credentials of the auditors, to NRC Region IV for its approval;

3. Direct six audits at calender quarterly intervals (three months) within 18 months of the date of this Order, the first audit shall be completed within three months of this Order;

4. Provide written audit reports, including recommended corrective actions for findings identified during the audits, to the Licensee within two weeks of the completion of the audit;

5. Provide written audit reports to NRC Region IV within two weeks of each audit; and

6. Evaluate the Licensee's written responses to the audit findings (see paragraph B.).

B. The Licensee shall provide written responses to the Advisory Committee's audit findings, including corrective actions for deficiencies identified during each audit, and measures to prevent recurrence of similar deficiencies.

The Regional Administrator, Region IV, may relax or rescind, in writing, any of the above conditions upon a showing by the Licensee of good cause.

V

Any person other than the Licensee adversely affected by this Confirmatory Order may request a hearing within 20 days of its issuance. Any request for a hearing shall be submitted to the Secretary, U.S. Nuclear Regulatory Commission, ATTN: Chief, Docketing and Service Section, Washington, DC 20555. Copies also shall be sent to the Director, Office of Enforcement, U.S. Nuclear Regulatory Commission, Washington, DC 20555, to the Assistant General Counsel for Hearings and Enforcement at the same address, to the Regional Administrator, NRC Region IV, 611 Ryan Plaza Drive, suite 1000, Arlington, Texas 76011, and to the Licensee. If such a person requests a hearing, that person shall set forth with particularity the manner in which his interest is adversely affected by this Order and shall address the criteria set forth in 10 CFR 2.714(d).

If a hearing is requested by a person whose interest is adversely affected, the Commission will issue an Order designating the time and place of any hearing. If a hearing is held, the issue to be considered at such hearing shall be whether this Confirmatory Order should be sustained.

In the absence of any request for hearing, the provisions specified in Section IV above shall be final 20 days from the date of this Order without further order or proceedings. An answer or a request for hearing shall not stay the immediate effectiveness of this order.

Dated at Rockville, Maryland this 15th day of November 1992.

For the Nuclear Regulatory Commission.

Hugh L. Thompson, Jr.,

Deputy Executive Director for Nuclear Materials Safety, Safeguards, and Operations Support.

BILLING CODE 7590-01-M

OFFICE OF THE UNITED STATES TRADE REPRESENTATIVE

[Docket No. 301-80]

Canadian Provincial Practices Affecting Canadian Imports of Beer

AGENCY: Office of the United States Trade Representative.

ACTION: Notice of proposed determinations under section 304 of the Trade Act of 1974, as amended ("Trade Act"); and request for public comments.

SUMMARY: On June 29, 1990, the United States Trade Representative (USTR) initiated an investigation under section 302 of the Trade Act of certain practices of Canadian provincial liquor boards with respect to imported beer. The USTR proposes to determine that rights of the United States under the General Agreement on Tariffs and Trade are being denied as a result of these practices and, in the event that a mutually satisfactory resolution cannot be reached with Canada, to take appropriate action. Among the actions that the USTR would consider taking is the suspension of duty bindings and increase in duties on Canadian beer and other alcoholic beverages. The USTR invites public comments.

DATES: Comments from interested persons must be submitted in writing by 12 p.m. on December 23, 1991. The USTR expects to make final determinations under section 304 no later than December 29, 1991.

ADDRESSES: Comments should be addressed to the Chairman, Section 301 Committee, Office of the United States Trade Representative, room 223, 600 17th Street, NW., Washington, DC 20506.

FOR FURTHER INFORMATION CONTACT: Rick Ruzicka, Director, Canadian Affairs, (202) 395-3412, Joseph Papovich, Senior Trade Advisor for Agricultural Affairs, (202) 395-5006, or Andrew Shoyer, Assistant General Counsel, (202) 395-7203.

SUPPLEMENTARY INFORMATION: In 1985, a panel was established by the Contracting Parties to the General Agreement on Tariffs and Trade (GATT) at the request of the European Community with regard to market access restrictions on imported alcoholic beverages, including beer, maintained by Canadian provincial marketing agencies or "liquor boards." In most of the ten Canadian provinces, these liquor boards not only regulate the marketing of domestic beer in the province, but serve as import monopolies and may also warehouse, distribute, and retail imported beer. The panel found in 1988 that certain practices were inconsistent with the GATT, including: (a) Restrictions on the number of locations at which imported beer may be sold ("points of sale"); (b) discriminatory practices concerning the authorization needed from the liquor board to begin to sell a brand of beer in the province or continue to have it sold ("listing" or "delisting" practices); and (c) discriminatory markups on the price of beer sold by the liquor boards. The GATT Contracting Parties requested that Canada take all reasonable measures available to address these practices.

Canada failed to eliminate the practices found in 1988 to be inconsistent with the GATT. In fact, some provinces have instituted practices since 1988 that have caused competitive conditions to worsen for U.S. brewers. On June 29, 1990, an investigation was initiated pursuant to section 302 of the Trade Act upon the petition of G. Heileman Brewing Company with respect to provincial liquor board practices concerning imported beer. On the same day, the United States requested consultations with Canada under Article XXIII:1 of the GATT, as required under section 303 of the Trade Act. Consultations were held with Canada in July 1990, but no mutually satisfactory resolution was reached at that time. On September 14, 1990, the Stroh Brewery Company submitted a section 301 petition concerning pricing and distribution practices in the province of Ontario. On October 19, 1990, the USTR determined to address these allegations in the existing investigation rather than to initiate a separate investigation.

At the December 1990 session of the Contracting Parties, the United States requested that the Panel that had issued the 1988 report in the case brought by the European Community be reconvened to consider the extent to which Canada was meeting its GATT obligations with respect to provincial liquor board practices concerning markups, points of sale and listing/delisting. In addition, the United States requested that the Panel consider certain practices that had not been addressed in the 1988 report, including: (1) Restrictions on

private delivery; (2) minimum purchase or sale price restrictions; (3) discriminatory imposition of cost-of-service charges; (4) discriminatory pricing methodologies; (5) discriminatory imposition of environmental taxes; and (6) failure to provide sufficient notice of new practices.

The Panel was established on February 6, 1991, and issued its report to the Contracting Parties on October 16, 1991. The Panel concluded, *inter alia*, that Canada had failed to make "serious, persistent and convincing efforts" to ensure observance by the provincial liquor boards of the provisions of the GATT as they relate to the restrictions on points of sale and discriminatory markups that had been found in 1988 to be inconsistent with the GATT, and that this failure constituted *prima facie* nullification and impairment of U.S. rights under the GATT. Moreover, the Panel found that the restrictions on the private delivery of imported beer maintained by 8 of the 10 Canadian provinces were inconsistent with Canada's national treatment obligation under the GATT, and that minimum price requirements set in relation to domestic prices were also inconsistent with the GATT. The Panel recommended that the Contracting Parties request Canada to take reasonable steps to ensure observance of the provisions of the GATT by the provincial liquor boards, and to report to the Contracting Parties on the measures taken with regard to access to points of sale and differential markups before the end of March 1992 and with regard to private delivery and other matters before the end of July 1992. A copy of the Panel report has been placed in the public file in this matter (Docket No. 301–80).

Consultations were commenced with the Government of Canada following receipt of the Panel report, but no mutually satisfactory resolution has been reached.

Proposed Determinations

On the basis of the investigation initiated under section 302 of the Trade Act, the consultations conducted pursuant to section 303 of the Trade Act, and the final report of the GATT dispute settlement panel, the USTR proposes to determine that the rights to which the United States is entitled under a trade agreement are being denied.

The USTR further proposes to continue consultations with the Government of Canada to reach a mutually satisfactory resolution in this matter. If such a resolution is not reached by December 29, 1991, or if one of the other conditions stated in section 301(a)(2) of the Trade Act has not been satisfied, then the USTR proposes to take action within the scope of section 301(c) of the Trade Act. Among the actions that the USTR would consider taking is the suspension of duty bindings and increase in duties on Canadian beer and other alcoholic beverages.

Public Comments

The public is invited to comment on: (1) Whether the Canadian provincial practices at issue are actionable under section 301, including comments on whether they deny benefits under a trade agreement; and if so, (2) the amount of the burden or restriction on U.S. commerce caused by the Canadian provincial practices; and (3) the appropriateness of each of the forms of action provided for in section 301(c). The comments submitted will be considered in determining actionability under section 301 and in recommending any action under section 301 to the USTR.

Comments should be submitted in writing, in 20 copies, by 12 p.m. on December 23, 1991. All written comments must be filed in accordance with 15 CFR 2006.8.

Comments will be placed in a file (Docket 301–80) open to public inspection pursuant to 15 CFR 2006.13, except confidential business information exempt from public inspection in accordance with 15 CFR 2006.15. (Confidential business information submitted in accordance with 15 CFR 2006.15 must be clearly marked "BUSINESS CONFIDENTIAL" in a contrasting color ink at the top of each page on each of 20 copies, and must be accompanied by a nonconfidential summary of the confidential information. The nonconfidential summary shall be placed in the public file.) The docket shall be available for public inspection at the USTR Reading Room, room 101, Office of the United States Trade Representative, 600 17th Street, NW, Washington, DC. An appointment to review the docket may be made by calling Brenda Webb, (202) 395–6186. The USTR Reading Room is open to the public from 10 a.m. to 12 p.m. and from 1 p.m. to 4 p.m., Monday to Friday (except holidays).

A. Jane Bradley,

Chairman, Section 301 Committee.

BILLING CODE 3190–01–M

OVERSIGHT BOARD

National Advisory Board; Meeting

AGENCY: Oversight Board.

ACTION: Meeting notice.

SUMMARY: In accordance with section 10(a)(2) of the Federal Advisory Committee Act (5 U.S.C.(A)), announcement is hereby published for a meeting of the National Advisory Board. The meeting is open to the public.

DATES: The meeting is scheduled for Monday, December 16, 9 a.m. to 12 noon.

ADDRESSES: The meeting will be held in the Office of Thrift Supervision, Amphitheater, Second Floor, 1700 G Street, NW., Washington, DC.

FOR FURTHER INFORMATION CONTACT: Jill Nevius, Committee Management Officer, Oversight Board for RTC, 1777 F Street, NW., Washington, DC 20232, 202/786–9675.

SUPPLEMENTARY INFORMATION: Section 501(a) of the Financial Institutions Reform, Recovery, and Enforcement Act of 1989 (the ACT), Public Law No. 101–73, 103 Stat. 183, 382–383, directed the Oversight Board to establish one national advisory board and six regional advisory boards.

Purpose

The purpose of the National Advisory Board is to provide information and advice to the Oversight Board and the RTC on the disposition of real property assets.

Agenda

A detailed agenda will be available at the meeting. There will be briefings from the chairman of each of the six regional advisory boards on the regional meetings held throughout the country between November 13 and December 13, 1991. Discussion will focus on the key topics from the meetings: seller financing, SAMDA contracting, local real estate conditions, and auctions.

Statements

Interested persons may submit, in writing, data, information, or views on the issues pending before the National Advisory Board prior to or at the meeting. The meeting is open to the public. Seating is available on a first come first served basis.

Dated: November 22, 1991.

Jill Nevius,

Committee Management Officer, Oversight Board, Advisory Board Affairs.

BILLING CODE 2222–01–M

SECURITIES AND EXCHANGE COMMISSION

[Release No. IA-1292]

Intention To Cancel Registrations of Certain Investment Advisers

October 29, 1991.

Notice is given that the Securities and Exchange Commission (the "Commission") intends to issue an order, pursuant to section 203(h) of the Investment Advisers Act of 1940 (the "Act"), cancelling the registrations of those investment advisers whose names appear in the attached appendix.

Section 203(h) provides, in pertinent part, that if the Commission finds that any person registered under section 203, or who has pending an application for registration filed under that section, is no longer in existence, or is not engaged in business as an investment adviser, the Commission shall by order cancel the registration of such person.

Paragraph (b) of rule 204–1, requires an investment adviser to file promptly an amendment to its application for registration (Form ADV) when its address changes or when certain other information becomes inaccurate in a material manner.[1]

The Commission has been sending all registrants a booklet of registration materials annually since 1987. Each booklet contains copies of Forms ADV, ADV–S, ADV–E and ADV–W.[2] These forms, when properly filed, are used to update the Commission's records. Since the 1987 mailing, the Commission has had correspondence for each of the registrants listed in the Appendix returned as "undeliverable" (addressee unknown, forwarding order expired, or no longer at this address) by U.S. Postal Service. The Commission's records indicate that these registrants have not filed amendments to their registration, reflecting their current business and/or mailing addresses, as required by rule 204–1(b). The Commission's records also indicate that many of these registrants have not made annual filings of Form ADV–S, as required by rule 204–1(c). Accordingly, the Division of Investment Management believes that reasonable grounds exist for a finding that these registrants are no longer in existence or are no longer engaged in business as investment advisers.

Notice is also given that any interested person may, by December 20, 1991, at 5:30 p.m., submit to the Commission in writing a request for a hearing on the matter accompanied by a statement as to the nature of his interest, the reason for such request, and the issues, if any, of fact or law proposed to be controverted, and he may request that he be notified in the Commission should order a hearing thereon. Any such communication should be addressed: Secretary, Securities and Exchange Commission, Washington, DC 20549.

At any time after December 20, 1991, the Commission may issue an order cancelling any or all of the investment adviser registrations listed in the appendix, upon the basis of the information stated above, unless an order for hearing on the cancellation shall be issued upon request or upon the Commission's own motion. Persons who request a hearing, or to be advised as to whether a hearing is ordered, will receive any notices and orders issued in this matter, including the date of the hearing (if ordered) and any postponements thereof.

For further information contact: Robert L. Lewis, Financial Analyst at (202) 272–3015 (Division of Investment Management, Office of Financial Analysis).

For the Commission, by the Division of Investment Management, pursuant to delegated authority.

Margaret H. McFarland,

Deputy Secretary.

BILLING CODE 8010-01-M

[Release No. 34-29969; File No. SR-Amex-91-29]

Self-Regulatory Organizations; Notice of Filing of Proposed Rule Change by the American Stock Exchange, Inc., Relating to Percentage Orders

November 20, 1991.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 ("Act"), 15 U.S.C. 78s(b)(1), notice is hereby given that on October 17, 1991, the American Stock Exchange, Inc. ("Amex" or "Exchange") filed with the Securities and Exchange Commission ("Commission") the proposed rule change as described in Items I, II and III below, which Items have been prepared by the self-regulatory organization. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The Amex is proposing to amend its Rules 131 and 154, on a permanent basis, to broaden a specialist's ability to represent percentage orders,[1] and to generally expand the types of percentage orders permissible. The Commission approved the proposed rule change on a one-year pilot basis, ending January 17, 1992.[2]

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the self-regulatory organization included statements concerning the purpose of

[1] Amex Rule 131(n) defines a percentage order as "a limited price order to buy (or sell) 50% of the volume of a specified stock after its entry."

[2] See Securities Exchange Act Release No. 28792 (January 17, 1991), 56 FR 2965 (order temporarily approving File No. SR-Amex-90-11 for a one-year pilot period).

and basis for the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. The self-regulatory organization has prepared summaries, set forth in sections A, B, and C below, of the most significant aspects of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

(1) Purpose

The Exchange is requesting permanent approval of changes to Exchange Rules 131 and 154, as they relate to percentage orders, which changes were approved previously by the Commission for a one-year pilot period ending January 17, 1992.[3] The Exchange believes that the changes made to these rules have contributed to the efficiency of the Exchange's market by providing specialists with the necessary flexibility to handle and service large-size orders.[4]

At the Commission's request, the Exchange is currently compiling information regarding its experience under the pilot. The Exchange expects to file its report with the Commission shortly.[5] The Exchange anticipates that the information contained therein will demonstrate that the new percentage order rules have enhanced the quality of the Exchange's auction market and ensured that the increased opportunities for converting percentage orders into limit orders do not come at the cost of unduly influencing the market.

2. Statutory Basis

As discussed in the Amex's earlier filing (File No. SR–Amex–90–11), the proposed rule change is consistent with section 6(b) of the Act in general and furthers the objective of section 6(b)(5) in particular in that it will promote the quality, depth and liquidity of the Exchange's stock market. By permitting the specialist to add depth and liquidity through his representation of percentage orders in situations where he may not have previously done so, this proposed rule change will have the effect of "facilitating transactions in securities" and will help to "perfect the mechanism of a free and open market" as called for in section 6(b)(5). By creating opportunities for participation of percentage orders in the Exchange's auctions where none previously existed, it will remove impediments to, and otherwise facilitate, a free and open market for stock transactions.

In addition, the proposed rule change will enable the Exchange to better handle large orders, thereby promoting intermarket competition for those orders. This will remove a burden on competition not necessary or appropriate in furtherance of the purposes of the Act as called for in section 6(b)(8), and will promote fair competition among brokers and dealers as called for in section 11A(a)(1)(C)(ii).

This proposed rule change also furthers the Congressional finding enunciated in section 11A(a)(1) in that better market conversions will help assure dissemination to brokers, dealers and investors of quotation information that better reflects the interest on the Floor.

B. Self-Regulatory Organization's Statement on Burden on Competition

The proposed rule change will impose no burden on competition.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received from Members, Participants or Others

No written comments were solicited or received with respect to the proposed rule change.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Within 35 days of the date of publication of this notice in the **Federal Register** or within such other period (i) as the Commission may designate up to 90 days of such date if it finds such longer period to be appropriate and publishes its reasons for so finding or (ii) as to which the self-regulatory organization consents, the Commission will:

(A) By order approve the proposed rule change, or

(B) Institute proceedings to determine whether the proposed rule change should be disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views and arguments concerning the foregoing. Persons making written submissions should file six copies thereof with the Secretary, Securities and Exchange Commission, 450 Fifth Street NW., Washington, DC 20549. Copies of the submission, all subsequent amendments all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for inspection and copying at the Commission's Public Reference Section, 450 Fifth Street NW., Washington, DC 20549. Copies of such filing will also be available for inspection and copying at the principal office of the Amex. All submissions should refer to File No. SR–Amex–91–29 and should be submitted by December 18, 1991.

For the Commission, by the Division of Market Regulation, pursuant to delegated authority.[6]

Margaret H. McFarland,

Deputy Secretary.

[Release No. 34–29959; File No. SR–CBOE–91–39]

Self-Regulatory Organizations; Notice of Filing of Proposed Rule Change by the Chicago Board Options Exchange, Inc., Relating to Offers of Settlement and Scheduling of Hearings

November 19, 1991.

Pursuant to section 19(b)(1) of the Securities Exchange Act of 1934 ("Act"), 15 U.S.C. 78s(b)(1), notice is hereby given that on October 25, 1991, the Chicago Board Options Exchange, Inc. ("CBOE" or "Exchange") filed with the Securities and Exchange Commission ("SEC" or "Commission") the proposed rule change as described in Items I, II and III below, which Items have been prepared by the self-regulatory organization. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The CBOE proposes to amend its rules relating to offers of settlements and the scheduling of hearings by modifying Exchange Rule 17.8. The proposed changes include limiting to 120 the number of days in which a respondent in a CBOE disciplinary proceeding may submit settlement offers after a statement of charges has been served

and limiting the number of settlement offers within that 120-day period to two. In addition, the proposal provides that a hearing will be scheduled following the end of the 120-day period, or earlier, if the Business Conduct Committee ("BCC") has rejected the respondent's second settlement offer. Finally, the proposal provides that respondents must request access to documents in writing within 60 days after being served a statement of charges. The text of the proposal is available at the Office of the Secretary, CBOE and at the Commission.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the self-regulatory organization included statements concerning the purpose of and basis for the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. The self-regulatory organization has prepared summaries, set forth in sections (A), (B), and (C) below, of the most significant aspects of such statements.

(A) Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

(1) Purpose

Currently, the Exchange's disciplinary process allows a respondent to present an unlimited number of settlement offers up to the time the BCC renders a decision. The CBOE's rules do not provide specific time limits in which a disciplinary hearing must be held, nor do they limit the number of settlement offers a respondent may submit. As a result, as noted by the CBOE and by the Commission during an inspection of the Exchange last year, the Exchange's "disciplinary procedures have afforded respondents the opportunity to protract unreasonably the resolution of formal disciplinary matters through requests for dismissal of charges and unrealistic offers of settlement." In response to this problem, the Exchange proposes to limit to 120 days the time period for presenting settlement offers, as well as the number of settlement offers which may be submitted, to limit the time in which a respondent may request written access to documents, and to require the BCC to schedule a hearing at the end of the 120-day period, or earlier, if the BCC has rejected a respondent's second settlement offer.

Specifically, the CBOE proposes to amend Exchange Rule 17.8, "Offers of Settlement," to provide that a respondent will have 120 calendar days from the date of service of a statement of charges in which to present settlement offers. During that time, a respondent will be allowed to submit only two settlement offers, although the BCC, at its discretion, may permit a respondent to submit an additional settlement offer if the pertinent details of the respondent's offer are consistent with the parameters and criteria deemed acceptable by the BCC.

The CBOE's Office of Enforcement has concluded that unless respondents are under a time constraint such as the one proposed by the CBOE, respondents have no sense of urgency to settle matters. In fact, some respondents intentionally seek to delay the resolution of their matter. The CBOE notes that such delay causes evidence to become stale, witnesses to vanish, and justice to be circumscribed. Therefore, to augment and reinforce the proposed limitations on the number of settlement offers which may be submitted and the time constraints in which these offers may be presented, the CBOE also plans to require the BCC to schedule a hearing date at the end of the 120-day period, or earlier, if the BCC has rejected a respondent's second settlement offer. The CBOE believes that these amendments should allow the Exchange's disciplinary process to operate more efficiently and effectively.

Finally, the CBOE proposes to modify the respondent's right to have access to documents by providing that a respondent must make a written request for access to documents within 60 calendar days after being served a statement of charges. The Exchange believes that the 60-day time period should adequately protect a respondent's right to the documents and, at the same time, should prevent respondents from attempting to circumvent the 120-day period by requesting documents on the 119th day and then claiming that the Exchange unreasonably delayed the discovery process and thereby hindered settlement attempts. The Exchange notes that the 120-day period does not include the number of calendar days in excess of seven in which it takes the Exchange staff to provide access to documents after a request for documents is made by a respondent.

(2) Basis

The CBOE believes that the proposed rule change is consistent with Section 6(b) of the Act, in general, and furthers the objectives of Section 6(b)(5), in particular, in that it protects investors and the public interest by promoting an efficient means of disciplining those who violate Exchange Rules and/or the Federal securities laws.

(B) Self-Regulatory Organization's Statement on Burden on Competition

The CBOE does not believe that the proposed rule change will impose any inappropriate burden on competition.

(C) Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants or Others

No written comments were either solicited or received with respect to the proposed rule change.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Within 35 days of the date of publication of this notice in the **Federal Register** or within such longer period (i) as the Commission may designate up to 90 days of such date if it finds such longer period to be appropriate and publishes its reason for so finding or (ii) as to which the self-regulatory organization consents, the Commission will:

(a) By order approve such proposed rule change, or

(b) institute proceedings to determine whether the proposed rule change should be disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views and arguments concerning the foregoing. Persons making written submissions should file six copies thereof with the Secretary, Securities and Exchange Commission, 450 Fifth Street, NW., Washington, DC 20549. Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for inspection and copying at the Commission's Public Reference Section, 450 Fifth Street, NW., Washington, DC. Copies of such filing will also be available for inspection and copying at the principal office of the above-mentioned self-regulatory organization. All submissions should refer to the file number in the caption above and should be submitted by December 18, 1991.

For the Commission, by the Division of Market Regulation, pursuant to delegated authority.

Margaret H. McFarland,

Deputy Secretary.

[FR Doc. 91-28495 Filed 11-26-91; 8:45 am]

BILLING CODE 8010-01-M

(Release No. 34-29977; File No. SR-DGOC-91-03

Self-Regulatory Organizations; Delta Government Options Corp.; Notice of Filing of Proposed Rule Change Relating to the Definition of Exercise Price

November 21, 1991.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 ("Act"), 15 U.S.C. 78s(b)(1), notice is hereby given that on Novmeber 15, 1991, Delta Government Options Corp. ("DGOC") filed with the Securities and Exchange Commission ("Commission") the proposed rule change (SR-DGOC-91-03) as described in Items I, II, and III below, which items have been prepared by DGOC. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The purpose of the proposed rule change is to amend the definition of "Exercise Price" in DGOC's Procedures.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, DGOC included statements concerning the purpose of and statutory basis for the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. DGOC has prepared summaries, set forth in sections (A), (B), and (C) below, of the most significant aspects of such statements.

(A) Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule change

The purpose of the proposed rule change is to amend DGOC's Procedures so that "Exercise Price" is defined as the price stated in whole numbers and quarters for an option contract on a treasury bond or note with a remaining term to maturity of three years or more or the price stated in whole numbers and sixteenths for an option contract on a treasury bill or note with a remaining term to maturity of less than three years. Currently, Exercise Price is stated either in whole numbers and halves or in whole numbers and quarters, respectively. DGOC filed the proposal in order to respond to DGOC participants' requests for finer gradations in options prices especially with respect to options that are for shorter periods of time or are on underlying securities that have a shorter term to maturity. A more precise exercise price will afford DGOC participants greater flexibility and will enable such participants to engage in more trading especially during periods of low volatility where small incremental changes in options pricing become a more and more significant component of the decision to buy or sell an option.

The proposed rule change is consistent with the requirements of section 17A of the Act and the rules and regulations thereunder applicable to DGOC since it will permit more utilization of DGOC's Over-The-Counter Options Trading System by those participants who prefer to trade in options for hedging purposes or speculation. In particular, the tailoring of the option exercise price as proposed by DGOC will afford DGOC participants additional flexibility to choose an option exercise price that more precisely matches their overall treasury security portfolio. The proposal, moreover, will enable DGOC participants to submit for processing at DGOC over-the-counter treasury options trades that prior to this proposal could not be submitted because their stated exercise price was other than that previously available through DGOC.

DGOC's proposal, therefore, will allow for the automated clearance and settlement of securities that otherwise would have been cleared via a decentralized, inefficient, and labor-intensive process.

(B) Self-Regulatory Organization's Statement on Burden on Competition

DGOC does not believe that the proposed rule change will impose any burden on competition not necessary or appropriate in furtherance of the purpose of the Act.

(C) Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

Not applicable.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Within thirty-five days of the date of publication of this notice in the **Federal Register** or within such longer period (i) as the Commission may designate up to ninety days of such date if it finds such longer period to be appropriate and publishes its reasons for so finding or (ii) as to which DGOC consents, the Commission shall:

(A) By order approve such proposed rule change or

(B) Institute proceedings to determine whether the proposed rule change should be disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing. Persons making written submissions should file six copies thereof with the Secretary, Securities and Exchange Commission, 450 Fifth Street, NW., Washington, DC 20549. Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any persons, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for inspection and copying in the Commission's Public Reference Section, 450 Fifth Street, NW., Washington, DC 20549. Copies of such filing will also be available for inspection and copying at the principal office of DGOC. All submissions should refer to File No. SR-DGOC-91-03 and should be submitted by December 18, 1991.

For the Commission, by the Division of Market Regulation, pursuant to delegated authority.

Margaret H. McFarland,

Deputy Secretary.

BILLING CODE 8010-01-M

(Release No. 34-29973; File No. SR-MBSCC-90-08)

November 20, 1991.

Self-Regulatory Organizations; MBS Clearing Corporation; Notice of Proposed Rule Change Relating to Revised Standards for Letter of Credit Issuers

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934, ("Act") 15 U.S.C. 78s(b)(1), notice is hereby

given that on October 30, 1990, MBS Clearing Corporation ("MBSCC") filed with the Securities and Exchange Commission ("Commission") the proposed rule change as described in Items I, II, and III below, which items have been prepared by the self-regulatory organization. On August 19, 1991, MBSCC amended the proposed rule change, which MBSCC corrected on November 15, 1991.[1] The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

MBSCC proposes to revise its eligibility standards for banks issuing letters of credit on behalf of MBSCC participants.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, MBSCC included statements concerning the purpose of, and basis for, the proposed rule change, and discussed any comments it received on the proposed rule change. The test of these statements may be examined at the places specified in Item II below. MBSCC has prepared summaries, set forth in sections (A), (B), and (C) below, of the most significant aspects of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

The purpose of the proposed rule change is to revise and strengthen MBSCC's criteria for issuers of letters of credit. Under its rule, deposits to the MBSCC Participants Fund, in excess o the basic deposit, may be made by delivery to MBSCC of an irrevocable letter of credit issued by an approved bank or trust company. MBSCC may approve as the issuer of the letter of credit any domestic or foreign bank or trust company meeting the requirements set forth in MBSCC's procedures. Under MBSCC's current procedures, both domestic and foreign issuers must demonstrate a Moody's Investor Service ("Moody's") long-term debt rating of at least A–3.[2]

MBSCC has conducted a comprehensive review of its risk management system with the goal of further minimizing related operational and financial risks. MBSCC's management has placed particular emphasis on letters of credit generally and letter of credit issuer eligibility standards in particular. MBSCC requires banks issuing letters of credit to honor drafts in accordance with MBSCC's instructions by 4:30 p.m. (Eastern Time) on the day of presentation, notwithstanding any contrary provision under commercial law.[3]

In the present rule filing, MBSCC is revising its standards for eligible issuers of letters of credit. Issuers will now be required to maintain prescribed Standard & Poor's, as well as Moody's, long term debt ratings. In the absence of available long term debt ratings, MBSCC will also consider as a substitute such issuer's Moody's or Standard & Poor's long term deposit ratings.

The proposed new standards for letter of credit issuers are summarized below:

1. Letter of credit issuers must have and maintain a Moody's long-term debt rating of at least A–3 and a Standard & Poor's long-term debt rating of at least A–.

2. In the event that a current or prospective letter of credit issuer does not have a Moody's or Standard & Poor's long-term debt rating, the long-term deposit rating must be at least A–3 in the case of Moody's and at least an A– in the case of Standard & Poor's.

3. In the event that a prospective letter of credit issuer has neither a Standard & Poor's nor a Moody's long-term debt rating, a determination of the eligibility of a prospective letter of credit issuer will be made by MBSCC's management and/or the Board of Directors, in consultation with the risk management committee. In no event will the aggregate value of the letters of credit issued by such banks exceed 0.5% or ½ of 1% of the total Participants' Fund deposit of all Participants.

The new standards retain the current Moody's A–3 requirement and further require an issuer to also maintain a prescribed Standard & Poor's rating. The standards also provide MBSCC management with the flexibility of reviewing and considering the independent ratings of two, rather than one rating agencies. The new standards would help ensure the continued liquidity and creditworthiness of MBSCC's Clearing Fund, and, thus, are consistent with the requirements of Section 17A of the Act and the rules and regulations thereunder.

B. Self-Regulatory Organization's Statement on Burden on Competition

MBSCC does not believe that the proposed rule will have an impact or impose a burden on competition.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change, Received From Members, Participants, or Others

MBSCC has advised all participants of the proposed rule change. No formal comments have been received, however, informal participant comment responses have been positive. The proposed rule change received the unanimous support of MBSCC's risk management committee.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

With 35 days of the date of publication of this notice in the **Federal Register** or within such longer period (i) as the Commission may designate up to 90 days of such date if its finds such longer period to be appropriate and publishes its reason for so finding, or (ii) as to which the self-regulatory organization consents, the Commission will:

(A) by order approve such proposed rule change, or

(B) institute proceedings to determine whether the proposed rule change should be disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views and arguments concerning the foregoing. Persons making written submissions should file six copies thereof with the Secretary Securities and Exchange Commission, 450 Fifth Street, NW., Washington, DC 20549. Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed

[1] Amendment No. 1 initially clarified and corrected the original proposal to state that MBSCC management and/or the Board of Directors will have the authority to accept letters of credit issued by banks that do not meet the basic standards outlined in this Notice, provided the letters of credit issued by such banks should not exceed 5% of the total Participants' Fund deposits of all Participants. This figure was later changed, pursuant to MBSCC Board approval, to provide that such letters of credit do not exceed 0.5% or ½ of 1% of the total Participants' Fund deposits of all Participants. *See*, letter from Jeffrey E. Lewis, Associate Counsel and Assistant Secretary, MBSCC, to Ester Saverson, Branch Chief, Division of Market Regulation, Commission (November 15, 1991).

[2] A– and A–1, A–2, A–3 are credit ratings issued, respectively, by Standard and Poor's Corporation ("Standard & Poor's") and Moody's, to recommend the creditworthiness of various financial institutions with regard to certain financial obligations. These agencies may look at many factors, including profitability, capital, asset quality, liquidity, and management before assigning a rating to the obligations of a financial institution.

[3] See Securities Exchange Act Release No. 28806 (January 22, 1991), 56 FR 3129.

with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for inspection and copying in the Commission's Public Reference Section, 450 Fifth Street, NW., Washington, DC 20549. Copies of such filing will also be available for inspection and copying at the principle office of MBSCC. All submissions should refer to File No. SR-MBSCC-90-08 and should be submitted by December 18, 1991.

For the Commission, by the Division of Market Regulation, pursuant to delegated authority.

Margaret H. McFarland,

Deputy Secretary.

[FR Doc. 91-28498 Filed 11-26-91; 8:45 am]

BILLING CODE 8010-01-M

Self-Regulatory Organizations; Midwest Stock Exchange, Inc.; Application for Unlisted Trading Privileges in Over-the-Counter Issues and to Withdraw Unlisted Trading Privileges in Over-the-Counter Issues

November 21, 1991.

On November 13, 1991, the Midwest Stock Exchange, Inc. submitted an application for unlisted trading privileges ("UTP") pursuant to section 12(f)(1)(C) of the Securities Exchange Act of 1934 ("Act") in the following over-the-counter ("OTC") securities, *i.e.*, securities not registered under section 12(b) of the Act:

File No.	Symbol	Issuer
7-7529	CMCSA	Comcast Corp., Class A Common Stock, $1.00 par value.
7-7530	CSFN	Corestates Financial Corp., Common Stock, $1.00 par value.
7-7531	IMNX	Immunex Corporation, Common Stock, $.01 par value.
7-7532	SAFC	Safeco Corp., Common Stock, no par value.
7-7533	USBC	U.S. Bancorp, Common Stock, $5.00 par value.
7-7534	CTUS	Cetus Corporation, Common Stock, $.01 par value.
7-7535	QNTM	Quantum Corporation, Common Stock, $.01 par value.

The above-referenced issues are being applied for as an expansion of the exchange's program in which OTC securities are being traded pursuant to a grant of UTP.

The MSE also applied to withdraw UTP pursuant to section 12(f)(4) of the Act on the following issues:

The Exchange requests that Cetus Corporation be removed from the program due to its pending acquisition by Chiron Corporation. The Exchange also requests that Quantum Corporation be removed from the program due to its inactive trading.

Comments

Interested persons are invited to submit, on or before December 12, 1991, written comments, data, views and arguments concerning this application. Persons desiring to make written comments should file three copies with the Secretary, Securities and Exchange Commission, 450 Fifth Street, NW., Washington, DC 20549.

Commentators are asked to address whether they believe the requested grants of UTP would be consistent with section 12(f)(2), which requires that, in considering an application for extension of UTP in an OTC security, the Commission consider, among other matters, the public trading activity in such security, the character of such trading, the impact of such extension on the existing markets for such security and the desirability of removing impediments to and the progress that has been made toward the development of a national market system.

For the Commission, by the Division of Market Regulation, pursuant to delegated authority.

Margaret H. McFarland,

Deputy Secretary.

BILLING CODE 8010-01-M

[Release No. 34-29974; File No. SR-NASD-91-57]

Self-Regulatory Organizations; Proposed Rule Change by National Association of Securities Dealers, Inc., Relating to Improvements in the NASD Code of Arbitration Procedure

November 20, 1991.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 ("Act"), 15 U.S.C. 78s(b)(1), notice is hereby given that on November 4, 1991, the National Association of Securities Dealers, Inc. ("NASD" or "Association") filed with the Securities and Exchange Commission ("Commission" or "SEC") the proposed rule change as described in Items I, II, and III below, which Items have been prepared by the NASD. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The NSAD proposes to amend part III, section 13(d) of the NASD Code of Arbitration Procedure (the "Code")[1] to improve the efficiency of its arbitration process. In general, the proposed rule change is intended to allow for a single arbitrator in simplified cases where a counterclaim exceeds $10,000.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the NASD included statements concerning the purpose of, and basis for, the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. The NASD has prepared summaries, set forth in Sections (A), (B), and (C) below, of the most significant aspects of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

Clarifying Panel Size in Simplified Cases: The proposed rule change to Section 13(d) would permit the appointment of a single arbitrator in simplified cases [2] where a counterclaim or third-party claim exceeds $10,000, unless the parties demand a panel of three arbitrators. This conforms to the provisions of section 19(a) of the Code, which provides that a single arbitrator may be appointed where the amount in controversy does not exceed $30,000. In the event that the amount in controversy exceeds $30,000, section 19(b) of the Code would require the appointment of a panel of three arbitrators. Additionally, minor punctuation changes have been made to conform section 13 to other sections of the Code.

[1] NADS Securities Dealers Manual, CCH ¶3713.

[2] Section 13 provides an arbitration procedure, characterized as Simplified Arbitration, for any dispute, claim or controversy which is subject to arbitration, arising between a public customer and an associated person or a member, involving a dollar amount not exceeding $10,000. Section 13(f) allows for a single arbitrator in Simplified cases, and upon request, Section 13(i) allows for the appointment of two additional arbitrators to decide the matter in controversy.

The NASD believes that the proposed rule change is consistent with the provisions of section 15A(b)(6) of the Act, in that the proposed rule change will facilitate the efficiency of the arbitration process, to the benefit of the public interest and the protection of investors.

B. Self-Regulatory Organization's Statement on Burden on Competition

The NASD does not believe that the proposed rule change imposes any burden on competition not necessary or appropriate in furtherance of the purpose of the Act.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

Comments were neither solicited nor received.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Within 35 days of the date of publication of this notice in the **Federal Register** or within such longer period (i) as the Commission may designate up to 90 days of such date if it finds such longer period to be appropriate and publishes its reasons for so findings or (ii) as to which the self-regulatory organization consents, the Commission will:

A. By order approve such proposed rule change, or

B. Institute proceedings to determine whether the proposed rule change should be disapproved.

IV. Solicitation of Comment

Interested persons are invited to submit written data, views, and arguments concerning the foregoing. Persons making written submissions should file six copies thereof with the Secretary, Securities and Exchange Commission, 450 Fifth Street, NW., Washington DC 20549. Copies of the submission, all subsequent amendments, will written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for inspection and copying in the Commission's Public Reference Room. Copies of the filing will also be available for inspection and copying at the principal office of the NASD. All submissions should refer to the file number in the caption above and should be submitted by December 18, 1991.

For the Commission, by the Division of Market Regulation, pursuant to delegated authority, 17 CFR 200.30-3(a)(12).

Margaret H. McFarland,

Deputy Secretary.

[FR Doc. 91-28499 Filed 11-26-91; 8:45 am]

BILLING CODE 8010-01-M

[Release No. 34-29976; File No. SR-NASD-91-49]

Self-Regulatory Organizations; Proposed Rule Change by National Association of Securities Dealers, Inc., Relating to Improvements in the NASD Code of Arbitration Procedure

November 21, 1991.

Pursuant to section 19(b)(1) of the Securities Exchange Act of 1934 ("Act"), 15 U.S.C. 78s(b)(1), notice is hereby given that on September 24, 1991 the National Association of Securities Dealers, Inc. ("NASD" or "Association") filed with the Securities and Exchange Commission ("SEC" or "Commission") the proposed rule change as described in Items I, II, and III below, which Items have been prepared by the NASD. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The NASD proposes to amend Part III, sections 12, 13(h), 22, 29 and 41(h) of the NASD Code of Arbitration Procedure (the "Code") to improve the efficiency of its arbitration process.

In general, the proposed rule changes are intended to permit the referral of cases to the self-regulatory organization that supervises the market where the transaction occurred, provide pre-hearing procedures for simplified cases, provide a time period within which to raise a peremptory challenge to an arbitrator selected to determine pre-hearing matters, clarify the authority of arbitrators to proceed where a party fails to appear at any hearing session, and provide for the accrual of interest on awards.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the NASD included statements concerning the purpose of, and basis for, the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. The NASD has prepared summaries, set forth in sections (A), (B), and (C) below, of the most significant aspects of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

The proposed rule change is intended to accomplish the following:

1. Referral of Cases to Other Self-Regulatory Organizations

Under the proposed rule change to section 12, the Arbitration Department would review each claim to determine whether all transactions are readily identifiable as arising out of another market. If so, the claimant would be contacted and asked to consent to having the case referred to the appropriate self-regulatory organization for that market. It is intended that the NASD would retain jurisdiction where the claim involved a mix of securities from different markets.

2. Pre-Hearing Procedures in Simplified Arbitrations

The proposed rule change to section 13(h) refers the parties to the general pre-hearing procedures of section 32 when a hearing is to be conducted, and sets shorter time frames for discovery where no hearing is to be conducted, in keeping with the policy of expediting small claims cases.

3. Peremptory Challenge to Selected Arbitrator

The proposed rule change to section 22 clarifies existing practice, wherein a peremptory challenge must be raised within five days of notification of the arbitrator named under either the general selection procedures of section 21 or the pre-hearing procedures of section 32 (d) or (e), whichever comes first in the course of the arbitration. Thus, a party that has not objected to an arbitrator selected to handle a pre-hearing conference or discovery dispute may not later raise a peremptory challenge to the same arbitrator when notification is made of the names of the entire panel.

4. Failure of a Party to Appear

The proposed rule change to section 29 clarifies the authority of the arbitrator(s) to proceed with and dispose of a case if a party fails to appear not only at the initial hearing, but at any continuation hearing session.

5. Interest Accrual on Awards

The proposed rule change to section 41 adds a new paragraph (h), providing that interest will accrue from the date of the award if the award is not paid within 30 days of receipt or if the award is the subject of a motion to vacate that is denied, unless otherwise specified by the arbitrators in the award. The rate of interest will be the legal rate (if any) prevailing in the state where the award was rendered, unless a different rate is set by the arbitrators.

The NASD believes that the proposed rule change is consistent with the provisions of section 15A(b)(6) of the Act, in that the proposed rule change will facilitate the arbitration process in the public interest.

B. Self-Regulatory Organization's Statement on Burden on Competition

The Association does not believe that the proposed rule change will result in any burden on competition that is not necessary or appropriate in furtherance of the purposes of the Act, as amended.

Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

Comments were neither solicited nor received

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Within 35 days of the date of publication of this notice in the **Federal Register** or within such longer period (i) as the Commission may designate up to 90 days of such date if it finds such longer period to be appropriate and publishes its reasons for so finding or (ii) as to which the self-regulatory organization consents, the Commission will:

A. By order approve such proposed rule change, or

B. Institute proceedings to determine whether the proposed rule change should be disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing. Persons making written submissions should file six copies thereof with the Secretary, Securities and Exchange Commission, 450 Fifth Street, NW., Washington, DC 20549. Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for inspection and copying in the Commission's Public Reference Room. Copies of such filing will also be available for inspection and copying at the principal office of the NASD. All submissions should refer to the file number in the caption above and should be submitted by December 18, 1991.

For the Commission, by the Division of Market Regulation, pursuant to delegated authority, 17 CFR 200.30-3(a)(12).

Margaret H. McFarland,

Deputy Secretary.

BILLING CODE 8010-01-M

[Release No. 34-29979; File No. SR-NASD-91-60]

Self-Regulatory Organizations; Filing and Order Granting Accelerated Approval of Proposed Rule Change by the National Association of Securities Dealers, Inc., Relating to an Interim Extension of the OTC Bulletin Board Service through March 31, 1992

November 21, 1991.

Pursuant to section 19(b)(1) of the Securities Exchange Act of 1934 ("Act"),[1] notice is hereby given that on November 18, 1991, the National Association of Securities Dealers, Inc. ("NASD" or "Association") filed with the Securities and Exchange Commission ("Commission") the proposed rule change as described in Items I, II, and III below, which Items have been prepared by the NASD. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons, and to grant accelerated approval of the proposed rule change.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

On June 1, 1990, the NASD initiated operation of the OTC Bulletin Board Service ("Bulletin Board" or "Service") in accordance with the Commission's approval of File No. SR-NASD-88-19, as amended.[2] The Service provides a real-time quotation medium that NASD member firms can elect to use to enter, update, and retrieve quotation information (including unpriced indications of interest) for securities traded over-the-counter that are not included in the Nasdaq System nor listed on a registered national securities exchange (collectively referred to as "unlisted securities"). Essentially, the Bulletin Board is an electronic medium that supports NASD members' market making in unlisted securities through authorized Nasdaq Workstation units. Real-time access to quotation information captured in the Service is available to subscribers of Level 2/3 Nasdaq service as well as subscribers of vendors-sponsored services that now include Bulletin Board data. The Commission's approval of the Service was limited to a pilot term of one year, which expired on May 31, 1991. On May 28, 1991, the Commission granted an interim extension of the pilot through November 30, 1991.[3]

The NASD has filed this proposed rule change to obtain authorization for a further interim extension of the Service through March 31, 1992. During this four-month interval, there will be no changes in the Bulletin Board's operational features nor in the current fee structure.[4]

During the proposed extension, the NASD will also proceed to develop information for another 19b-4 filing that will address permanent status for the Service and the terms for continued inclusion of foreign securities/ADRs in the Service.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the NASD included statements concerning the purpose of and basis for the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. The NASD has prepared summaries, set forth in Section (A), (B), and (C) below, of the most significant aspects of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

The purpose of this filing is to ensure continuity in the operation of the

---

[1] 15 U.S.C. 78s(b)(1) (1990).

[2] See Securities Exchange Act Release No. 27975 (May 1, 1990), 55 FR 19124.

[3] See Securities Exchange Act Release No. 29249 (May 28, 1991), 56 FR 26172.

[4] On August 27, 1991, the Commission approved a monthly charge of $5/security position on NASD member firms displaying quotations or trading interest in the Service and a $.50 increase in the monthly Level 1 subscriber charge for receipt of Bulletin Board information through vendor services. See Securities Exchange Act Release No. 29616 (August 27, 1991), 56 FR 43826.

Service while the NASD gathers information necessary to support another 19b–4 filing that will request permanent approval of the Service. As of October 31, 1991, the Bulletin Board carried broker-dealers' quotations/indications of interest on 4,117 unlisted securities. Moreover, there were 231 NASD member firms registered as market makers in these securities, with a total of 10,480 market making positions.

During the proposed extension, foreign securities/ADRs will remain subject to the twice-daily update limitation that traces back to the Commission's original approval of the Service's operation. As a result, all priced bids/offers for these securities that are displayed in the Service will remain indicative.

In conjunction with the operation of the Service, the NASD has established a filing requirement and review procedures to verify member firms' compliance with Rule 15c2–11 under the Act.[5] During the proposed extension, this review process will continue to be an integral component of the NASD's self-regulatory oversight of the Service. Additionally, the NASD expects to work closely with the Commission staff in developing enhancements to the Service mandated by passage of the Securities Enforcement Remedies and Penny Stock Reform Act of 1990.

The NASD relies on sections 11A(a)(1), 15A(b) (6) and (11), and section 17B of the Act as the statutory basis for the instant rule change proposal. Section 11A(a)(1) sets forth the Congressional findings and policy goals respecting operational enhancements to the securities markets. Basically, the Congress found that new data processing and communications techniques should be applied to improve the efficiency of market operations, broaden the distribution of market information, and foster competition among market participants. Section 15A(b)(6) requires, among other things, that the NASD's rules promote just and equitable principles of trade, facilitate securities transactions, and protect public investors. Additionally, subsection (11) authorizes the NASD to adopt rules governing the form and content of quotations for securities traded over-the-counter for the purposes of producing fair and informative quotations, preventing misleading quotations, and promoting orderly procedures for collecting and disseminating quotations. Finally, section 17B contains the Congressional findings and directives respecting the collection and distribution of quotation information on low-priced unlisted equity securities.

The NASD submits that extension of the Service through March 31, 1992, is consistent with the foregoing provisions of the Act.

B. Self-Regulatory Organization's Statement on Burden on Competition

The NASD does not believes that any burden will be placed on competition as a result of this filing.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

Comments were neither solicited nor received.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

The NASD requests that the Commission find good cause, pursuant to section 19(b)(2) of the Act, for approving the proposed rule change prior to the 30th day after its publication in the **Federal Register** to avoid interruption of the Service. The current authorization for the Service extends through November 30, 1991. Hence, it is imperative that the Commission approve the instant filing on or before that date. Otherwise, the NASD will be required to suspend operation of the Service pending Commission action on the proposed extension.

The NASD believes that accelerated approval is appropriate to ensure continuity in the Service's operation pending a later determination on permanent status for the Service. Continued operation of the Service will ensure the availability of an electronic quotation medium to support member firm's market making in approximately 4,000 unlisted equity securities. The Service's operation also expedites price discovery and facilitates the execution of customer orders at the best available price.

The Commission finds good cause for approving the interim extension prior to the 30th day after the date of publishing notice of this filing. The Commission agrees with the NASD that accelerated approval of the proposal is appropriate to ensure continuity in the Service's operation as an electronic quotation medium that supports NASD's member's market making in these securities and that facilitates price discovery and the execution of customers orders at the best available price. Additionally, continued operation of the Service will materially assist the NASD's surveillance of trading in unlisted securities that are quoted in the Service.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing. Persons making written submissions should file six copies thereof with the Secretary, Securities and Exchange Commission, 450 Fifth Street, NW., Washington, DC 20549. Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for inspection and copying in the Commission's Public Reference Room. Copies of such filing will also be available for inspection and copying at the principal office of the NASD. All submissions should refer to the file number in the caption above and should be submitted by December 18, 1991

It is therefore ordered, pursuant to section 19(b)(2) of the Act, that the interim extension for the OTC Bulletin Board, be, and hereby is, approved for a four month period, ending on March 31, 1992.

For the Commission, by the Division of Market Regulation, pursuant to delegated authority.[6]

Margaret H. McFarland,

Deputy Secretary.

[FR Doc. 91–28501 Filed 11–26–91; 8:45 am]

BILLING CODE 8010–01–M

[Release No. 34–29975; No. SR–NYSE–91–37]

Self-Regulatory Organizations; Proposed Rule Change by New York Stock Exchange, Inc., Relating to Amendments to its Arbitration Rules

November 21, 1991.

Pursuant to section 19(b)(1) of the Securities Exchange Act of 1934 ("Act"), 15 U.S.C. 78s(b)(1), notice is hereby given that on October 24, 1991, the New York Stock Exchange, Inc. ("NYSE" or "Exchange") filed with the Securities and Exchange Commission ("Commission") the proposed rule change as described in Items I, II, and III below, which Items have been prepared by the self-regulatory organization. On

[5] See section 4 of Schedule H to the NASD By-Laws.

[6] 17 CFR 200.30–3(a)(12)(1991).

November 13, 1991, the NYSE submitted to the Commission an amendment to clarify certain language in the proposal.[1] The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The NYSE proposes several amendments to its arbitration rules. The proposed adoption of rule 600(c) seeks to provide for a more efficient allocation of arbitration claims among the various self-regulatory organizations ("SROs"). The proposed amendment to rule 601(a) will codify the practice of the Exchange in applying simplified procedures to claims under $10,000 without the demand or written request of the customer. The proposed adoption of rule 601(h)(ii) codifies the applicability of the Exchange's current discovery procedures to simplified arbitrations when a public customer demands a hearing. The proposed adoption of rule 601(h)(iii) establishes a procedure by which an arbitrator may resolve discovery disputes over the production of documents in simplified arbitrations where no hearing has been demanded. The proposed amendment of rule 616 will clarify the rule regarding the failure of a party to appear at a hearing. The proposed amendment to rule 625 will require parties submitting amended pleadings to provide the Director of Arbitration with sufficient copies for distribution to the appointed arbitrators. It also will require those parties to serve directly all other parties with the amended pleadings. The proposed amendment also will require parties answering amended pleadings to directly serve all other parties and the Director of Arbitration with their responsive pleadings. The proposed amendment to rule 627(e) will require that the names of counsel representing the parties and the type of product or security involved in an arbitration appear in the award. The proposed amendment to rule 627(g), which also will consolidate rules 627 (g) and (h), requires that interest on awards will accrue from the date of the award only if the award is not paid within the required thirty day period or a motion to vacate has been unsuccessful. The rule will expressly permit the arbitrators to set a different date on which interest will begin to accrue.

[1] See letter from James E. Buck, Senior Vice President and Secretary, NYSE to Mary N. Revell, Branch Chief, Division of Market Regulation, Commission, data November 12, 1991.

II. Self-Regulatory Organization's Statement of the Propose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the self-regulatory organization included statements concerning the purpose of, and basis for, the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. The self-regulatory organization has prepared summaries, set forth in Sections (A), (B), and (C) below, of the most significant aspects of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

The proposed rule changes are based for the most part on proposals developed by the Securities Industry Conference on Arbitration. In general, the proposed rule changes are intended to address the allocation of securities claims among SROs, clarify the use of the Simplified Arbitration Procedure and the applicable discovery procedures, clarify the arbitrators' authority to proceed in any arbitration session at which any party has failed to appear, require parties filing amended pleadings to directly serve the pleadings on the other parties to the arbitration, include the name(s) of counsel and the security or product involved in an arbitration in an award, and clarify the accrual of interest on awards.

(a) The purposes of the proposed changes are to:

- Provide for a more efficient allocation of claims among the various SROs [rule 600(a)];
- Apply simplified arbitration procedures to all claims under $10,000 without demand or written request of the customer [rule 601(a)];
- Provide for discovery in simplified arbitrations [rule 601(h)];
- Specify when a party may exercise a peremptory challenge (rule 609);
- Clarify the authority of arbitrators to proceed with an arbitration when a party fails to appear at a hearing (rule 616);
- Conserve arbitral resources and shorten the time required by the pleadings stage by requiring the parties to serve amended pleadings [rule 625(a)];
- Include the name(s) of counsel and the type of security or product in controversy in the arbitration award form [rule 627(e)];
- Clarify when interest is payable on an award [rule 627(g)].

9(b) The proposed changes are consistent with section 7(b)(5) of the Act in that they promote just and equitable principles of trade by insuring that members and member organizations and the public have an impartial forum for the resolution of their disputes.

B. Self-Regulatory Organization's Statement on Burden on Competition

The NYSE does not believe that the proposed rule change will result in any burden on competition that is not necessary or appropriate in furtherance of the purposes of the Act.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From members, Participants, or Others

The Exchange did not solicit comments on the proposed rule change. No letters were received from member organizations.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Within 35 days of the date of publication of this notice in the **Federal Register** or within such longer period (i) as the Commission may designate up to 90 days of such date if it finds such longer period to be appropriate and publishes its reasons for so finding, or (ii) as to which the self-regulatory organization consents, the Commission will:

(A) By order approve the proposed rule change, or

(B) Institute proceedings to determine whether the proposed rule change should be disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views and arguments concerning the foregoing. Persons making written submissions should file six copies thereof with the Secretary, Securities and Exchange Commission, 450 Fifth Street, NW., Washington, DC 20549. Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any persons, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for inspection and copying in the Commission's Public Reference Section, 450 Fifth Street, NW., Washington, DC

20549. Copies of such filing will also be available for inspection and copying at the principal office of the NYSE. All submissions should refer to File No. SR-NYSE-91-37 and should be submitted by December 18, 1991.

For the Commission, by the Division of Market Regulation, pursuant to delegated authority.

Margaret H. McFarland,

Deputy Secretary.

[FR Doc. 91-28502 Filed 11-26-91; 8:45 am]

BILLING CODE 8010-01-M

[Release No. 34-29961 File No. SR-PSE-91-10]

Self-Regulatory Organizations; Pacific Stock Exchange Inc.; Order Approving Proposed Change Relating to the Disclosure of Member Financial Arrangements

November 19, 1991.

On May 7, 1991, the Pacific Stock Exchange, Inc. ("PSE" or "Exchange") submitted to the Securities and Exchange Commission ("Commission"), pursuant to section 19(b)(1) of the Securities Exchange Act of 1934 ("Act") [1] and rule 19b-4 thereunder,[2] a proposed rule change to require PSE market makers, floor brokers, specialists or other PSE member organizations who enter into financial arrangements with any other PSE member to disclose to the Exchange the terms of such arrangements.[3]

The proposed rule change was published for comment in Securities Exchange Act Release No. 29248 (May 29, 1991), 56 FR 26176. No comments were received on the proposed rule change.

The PSE proposes to amend its rules relating to the disclosure of member financial arrangements by adding a new Exchange Rule 4.18 entitled "Disclosure of Financial Arrangements of Members." Specifically, new PSE Rule 4.18 would require each PSE market maker, floor broker, specialist or PSE member organization who enters into a financial arrangement with any other PSE member to disclosure to the PSE the name of such member and the terms of the arrangement.[4] The rule defines a financial arrangement to be: (1) The direct financing of a member's dealings upon the Exchange; (2) any direct equity investment or profit sharing arrangement; and (3) any consideration over the amount of $5,000.00 that constitutes a gift, loan, salary or bonus. In addition, the parties to a financial arrangement must provide a 10-day written notice period prior to the initiation or termination of such ar arrangement.

Existing PSE Rule 6.40 requires the disclosure of market maker financing arrangements to the Exchange.[5] This Rule mandates that market markers with financing arrangements between themselves disclose the arrangements to the Exchange in order to enhance the Exchange's ability to monitor the activity of market makers and their compliance with PSE rules. Because PSE Rule 6.40 only applies to options market makers, the Exchange currently does not have a rule governing the disclosure of financial arrangements between PSE members on its equity floor. Accordingly, the present proposal would expand the types of financial arrangements among PSE members that must be disclosed to the PSE to include all arrangements among PSE members. The Exchange believes that requiring disclosure of all financial arrangements among PSE members, not just options members, will serve to increase the PSE's ability to monitor existing financial arrangements in order to prevent potential collusive trading activity.

Proposed Rule 4.18 also provides the Exchange with the authority to restrict the trading activities of members with financial arrangements pursuant to PSE Rule 6.40. As discussed above, however, PSE Rule 6.40 applies solely to PSE options market makers, and the PSE does not intend to broaden the provisions of this rule to cover all PSE members.[6] Therefore, the language in proposed Rule 4.18 imposing trading restrictions on PSE members by cross-referencing the trading restrictions in rule 6.40 is limited solely to options market makers.[7]

The Commission finds that the proposed rule change is consistent with the requirements of the Act and the rules and regulations thereunder applicable to a national securities exchange, and, in particular, the requirements of section 6 [8] and the rules and regulations thereunder. Specifically, the Commission finds that required full disclosure of financing arrangements among all Exchange members is a reasonable means to prevent fraudulent and manipulative acts and practices and promote just and equitable principles of trade. By requiring all PSE members who enter into a financial arrangement with any other PSE member to disclose the name of such member and the terms of the arrangement, the Commission believes the Exchange will be better able to identify and deter collusive or prearranged trading and other trading abuses among its membership. In addition, the Exchange's ability to monitor the financial condition of its members will be enhanced.

The Commission also finds that the requirement that members give the Exchange 10 days written notice prior to the initiation or termination of a financial arrangement with another PSE member is consistent with section 6(b)(5) and (8) of the Act.[9] In particular, the pre-effective disclosure requirement for the initiation and termination of member financial arrangements does not impose any limitation or restriction on the ability of Exchange members to enter into financial arrangements with other PSE members. Accordingly, this disclosure provision does not place PSE members at a competitive disadvantage and does not permit the Exchange to have any control over member business decisions that are appropriately left to the discretion of the members.[10] In fact,

[1] 15 U.S.C. 78s(b)(1) (1982).

[2] 17 CFR 240.19b-4 (1989).

[3] See, *infra* note 5 and accompanying text for a description of the Exchange's current rules with respect to the disclosure of financial arrangements among PSE members.

[4] The PSE amended its proposed Rule 4.18 by deleting language in the proposal which would have authorized the Exchange to restrict the trading activity of members with financial arrangements "in instances that it deems appropriate, as determined on a case-by-case basis." See letter from Esther M.W. Aw, Regulation Administrator, PSE, to Howard Kramer, Assistant Director, Division of Market Regulation, SEC, dated September 13, 1991.

[5] PSE Rule 6.40 was amended in June, 1990, in order to require PSE market makers to disclose to the Exchange those financial arrangements by which they extend credit or receive credit from other PSE market makers, and to implement trading rules for market makers having financial arrangements between themselves and market makers that are joint account participants. Specifically, an options market maker having an existing financial arrangement with another market maker is not permitted to concurrently bid, offer, purchase, sell, or enter orders in the same options series. See Commentary .01 to PSE Rule 6.40. In addition, a market maker may not bid, offer, purchase, sell, or enter orders in an option series in which a floor broker holds an order on behalf of a market maker with whom he has an existing financial arrangement. Finally, orders of market makers having an existing financial arrangement are also not permitted to be concurrently represented, by one or more floor brokers, in a particular options series. See Commentary .02, PSE Rule 6.40. See also Securities Exchange Act Release No. 28134 (June 19,1990), 55 FR 26320.

[6] See letter from Esther M.W. Aw, Regulation Administrator, PSE, to Jeffrey Burns, Attorney, Options Regulation, Division of Market Regulation, SEC, dated October 23, 1991.

[7] *Id.*

[8] 15 U.S.C. 78f (1982).

[9] 15 U.S.C. 78f(b)(5), (8) (1990).

[10] See also Securities Exchange Act Release No. 29797 (October 8, 1991), 56 FR 51945, in which the Commission found that a similar notice provision involving substantial business transactions of clearing members of the Chicago Board Options Exchange was consistent with the Act.

the Commission believes the disclosure requirement is wholly consistent with the PSE's stated purpose for its proposal, namely, the enhancement of Exchange surveillance and member firm monitoring capabilities.

It is therefore ordered, pursuant to section 19(b)(2) of the Act,[11] that the proposed rule change (SR–PSE–91–10) is approved.

For the Commission, by the Division of Market Regulation, pursuant to delegated authority.[12]

Margaret H. McFarland,

Deputy Secretary.

BILLING CODE 8010–01–M

[Release No. SIPA–157; File No. SIPC 91–1]

Securities Investor Protection Corporation; Order Approving Proposed Bylaw Change Relating to SIPC Fund Assessments on SIPC Members.

November 20, 1991.

On September 27, 1991, the Securities Investor Protection Corporation ("SIPC") filed with the Securities and Exchange Commission ("Commission"), pursuant to Section 3(e)(1) of the Securities Investor Protection Act of 1970 ("SIPA"), 15 U.S.C. 78ccc(e)(1), a proposed bylaw change.

I. Description of Proposed Bylaw Change

The proposed bylaw change would amend Section 1 of Article 6 of SIPC's bylaw regarding SIPC Fund assessments on SIPC's members.[1] The proposed bylaw provides that the amount of each member's assessment for the member's fiscal year beginning in 1991 and subsequent fiscal years shall be the product of the member's net operating revenues from the securities business for such fiscal year and the assessment rate established by SIPC for such fiscal year.[2] The assessment rate shall be that percent of each member's net operating revenue from the securities business required to bring the SIPC Fund [3] to a specified target balance on the next April 1.

The term "net operating revenues from the securities business" means gross revenues from the securities business less interest and dividend expenses. The total deduction of interest and dividend expenses will not be allowed to exceed the total of all interest and dividend income. As an alternative to the proposed net operating revenues assessment base, SIPC will continue its current practice of allowing members to deduct from their gross revenues from the securities business 40 percent of interest earned on customers' securities accounts.[4]

A formula will be used to arrive at the assessment rate. Pursuant to the formula, the projected SIPC Fund will be deducted from the SIPC Fund target balance as of the next April 1 to determine the needed assessment income. The projected SIPC Fund will be determined by taking the SIPC Fund balance as of September 30 with the following adjustments: (i) Deducting SIPC's assessment collections for the period from the prior April 1 to September 30, (ii) adding the amount of SIPC's estimated interest income from September 30 to the end of the next March, and (iii) deducting SIPC's estimated liquidation costs and operating expenses from September 30 to the end of the next March. The assessment rate will equal the amount of needed assessment income divided by the projected assessable revenues of New York Stock Exchange members.[5] However, if the assessment determined under the formula exceeds ½ of 1 percent of a member's gross revenues from the securities business, the assessment shall be ½ of 1 percent of that member's gross revenues from the securities business.[6]

The specified annual target balance for the SIPC Fund will be based on a net annual growth rate of 10 percent selected by the SIPC Board. This growth rate will enable the SIPC Fund to reach $1 billion by April 1, 1997.[7]

SIPC indicated that the SIPC Board's actions described above were based principally on the "Report and Recommendations of the SIPC Task Force on Assessments," and on the data gathered and analyzed by the task force. The task force was composed of representatives of SIPC members, self-regulatory organizations, securities industry associations, U.S. government agencies, and the SIPC staff. The task force's principal recommendations were that (1) the fund grow at an annual rate of 8 percent to reach the $1 billion level targeted by the SIPC Board and (2) the assessment basis be changed from gross revenues from the securities business to net operating revenue from the securities business while, in the alternative, allowing firms to continue deducting 40 percent of margin interest income if this amount were greater than the dividend and interest expense deduction.[8]

II. Request for Public Comment

Section 3(e)(1) of the SIPA provides that SIPC must file with the Commission a copy of proposed bylaw changes. That section further provides that bylaw changes shall take effect 30 days after filing, unless the Commission either (i) disapproves the change as contrary to the public interest or the purposes of SIPA, or (ii) finds that the change involves a matter of such significant public interest that public comment should be obtained, in which case, the Commission may, after notifying SIPC in writing of such finding, require that the proposed bylaw change be considered by the same procedures as a SIPC proposed rule change.

The SIPC Fund, which is built from assessments on its members and the interest earned on the Fund, is used for the protection of customers of members liquidated under SIPA to maintain investor confidence in the securities markets. In light of this fact and because the bylaw change provides for a new assessment basis to reach a targeted annual fund balance, the Commission found, pursuant to section 3(e)(1)(B) of SIPA, that the proposed bylaw change involved a matter of such significant

---

[11] 15 U.S.C. 78s(b)(2) (1982).

[12] 17 CFR 200.30–3(a)(12) (1990).

[1] All broker-dealers registered under section 15(b) of the Securities Exchange Act of 1934, with some minor exceptions, are SIPC members.

[2] The minimum assessment will continue to be $150 per annum.

[3] The SIPC Fund consists of cash and amounts invested in U.S. government or agency securities. As of September 30, 1991, the SIPC Fund totalled $662 million. In addition, SIPC has access to a $500 million line of credit established by SIPC with a consortium of banks. Further, the SIPA authorizes SIPC to borrow, through the Commission, up to $1 billion from the United States Treasury Department.

[4] As to the 40 percent deduction, SIPC indicated that its Board of Directors ("SIPC Board") will consider within the next year whether the alternative deduction should be eliminated. SIPC states that the SIPC Board did not believe that it had sufficient information as to the impact on its members had it chosen to eliminate the deduction. The SIPC Board directed the SIPC staff to gather additional information on this matter.

[5] Currently, each SIPC member is required to pay assessments at the rate of 5/16 of 1 percent of the member's gross revenues from the securities business with certain permitted deductions, with a minimum assessment of $150.

[6] The bylaw change also provides that if SIPC determines that the SIPC Fund totals or is reasonably likely to total less than $150 million, the amount of each member's assessment shall be the amount determined under the formula or ¼ of one percent per annum of such member's gross revenues from the securities business, whichever is greater. If the SIPC Fund totals or is reasonably likely to total less than $100 million, the amount of each member's assessment shall be ½ of 1 percent per annum of such member's gross revenues from the securities business.

[7] The SIPC Board also decided to pursue the possibility of an increase in the size of SIPC's current line of credit.

[8] The task force recommended that assessments continue to be based on revenues rather than any other basis.

public interest that public comment should be obtained, and that the procedures applicable to proposed SIPC rule changes in section 3(e)(2) of SIPA should be followed. As required by section 3(e)(1)(B) of the SIPA, the Commission notified SIPC of the Commission's finding in writing.

Notice of the Commission's action including its request for public comment on the proposed bylaw change and notice of the proposed bylaw change together with the terms of substance thereof were given by the issuance of a Commission release (Securities Investor Protection Act Release No. 156, October 11, 1991) and by publication in the **Federal Register** (56 FR 51952, October 16, 1991).

III. The Comment Letters and Commission Response

The comment period expired on November 6, 1991. Seventeen letters of comment were received strongly supporting SIPC's proposed actions with two caveats.

One commenter strongly supported the proposed bylaw change, but also supported the task force's recommendation that those firms affected by SIPC's 1990 interpretation that only interest expense on matched repurchase and securities lending transactions could be deducted in calculating assessments be given a credit towards future SIPC assessments in order to offset the amounts paid for fiscal year 1990. One other commenter also supported that same recommendation.

Because SIPC's Board rejected the recommendation regarding credit for amounts paid in 1990 based on SIPC's interpretation, the matter is not currently before the Commission.

One commenter noted that the current SIPC assessment allows SIPC members to deduct from revenues net dividends and interest from securities in trading accounts, as well as 40% of interest earned on customers' securities accounts. Under the proposed SIPC bylaw, which will allow for an assessment on net operating revenues, the greater of all interest and dividend expense (not to exceed interest and dividend income) or 40% of interest earned on customers' securities accounts will be the allowable deduction. Thus, well capitalized firms which use little or no debt to finance their inventory will no longer be able to take advantage of both deductions.

This issue was considered by the task force. Recognizing that some firms would be adversely affected by eliminating both the net interest and dividend deduction as well as the 40% deduction, the task force determined that the choice under the proposed bylaw, together with a reduced assessment rate if liquidations costs continue at the present rate, would be equitable to the brokerage community as a whole. The Commission agrees with that determination.

IV. Approval of Proposed Bylaw Changes

The Commission believes that SIPC's proposed actions provide substantial protection for customers of broker-dealers liquidated under SIPA. The Commission is of the view that the proposed bylaw change will not only result in an increase of the SIPC Fund, but also will promote investor confidence in the securities markets. The targeting of an annual balance for the SIPC Fund based on a net annual growth rate, ten percent, selected by the SIPC Board will increase the size of the SIPC Fund in stable planned, increments that will enable the SIPC Fund to reach the $1 billion level on a predetermined date in early 1997. The Commission also believes that it is appropriate to change the assessment base from gross revenues from the securities business to net operating revenues from the securities business in light of the increasing proportion of interest based transactions contributing to industry revenues.

Accordingly, the Commission finds that the proposed SIPC bylaw change is in the public interest and is consistent with the purposes of the SIPA.

It is therefore ordered, pursuant to Section 3(e)(2) of the SIPA, that the above-mentioned proposed bylaw change be, and hereby is, approved.

By the Commission.

Margaret H. McFarland,

Deputy Secretary.

BILLING CODE 8010-01-M

DEPARTMENT OF TRANSPORTATION

Office of the Secretary

Advisory Commission on Conferences in Ocean Shipping; Open Meeting

AGENCY: Department of Transportation (DOT), Office of the Secretary.

ACTION: Notice of open meeting of the Advisory Commission on Conferences in Ocean Shipping.

SUMMARY: The Commission will be holding a meeting in Washington, DC on Monday and Tuesday, December 16–17, 1991; the meeting is open to the public. The Commission plans to examine key issues before the Commission, particularly service contracting and antitrust immunity.

DATES: *Meeting:* Monday and Tuesday, December 16–17, 1991; 9:30 a.m. to 5:30 p.m. e.s.t.

ADDRESSES: The address for the public meeting is Department of Transportation Headquarters Building, 400 Seventh Street, SW., Washington, DC, room 9230.

FOR FURTHER INFORMATION CONTACT: Florizelle B. Liser, Executive Director; telephone (202) 366–9781; FAX (202) 366–7870.

SUPPLEMENTARY INFORMATION: The Commission was created by the Shipping Act of 1984 to conduct an independent and comprehensive study of conferences in ocean shipping, particularly whether the Nation would be best served by prohibiting conferences, or by closed or open conferences. The Commission is to provide its report, including recommendations, to the President and the Congress by April 10, 1992. After holding five field hearings arond the country during the summer, the Commission began the deliberative stage of its work in October. At this meeting, the Commissioners will discuss preliminary background chapters and options for inclusion in the report. In particular, they will focus on service contracting on Monday, December 16, 1991 and on antitrust immunity on Tuesday, December 17, 1991.

Issued in Washington, DC on November 22, 1991.

Florizelle B. Liser,

Executive Director.

Chemical Transportation Advisory Committee (CTAC) Meeting and CTAC Subcommittee on Tank Filling Limits Meeting

AGENCY: Coast Guard, DOT.

ACTION: Notice of meetings.

SUMMARY: A. The Chemical Transportation Advisory Committee (CTAC) will hold a meeting on Friday, February 28, 1992 in room 2415, U.S. Coast Guard Headquarters, 2100 2nd Street, SW., Washington, DC 20593. The meeting is scheduled to begin at 9:30 a.m. and end at 4 p.m.

The agenda for the meeting follows:

1. Opening remarks.
2. U.S. Coast Guard remarks.

3. General interest topics.
4. Issue briefs:
   Benzene regulations.
   Tankerman regulations.
   TSAC work—part 151.
5. Subcommittee reports:
   46 CFR part 151 update.
   Marine vapor recovery.
   Tank filing limits.
   Inert gas systems.
   Coal tar.
   Fire fighting media review/foam.
6. New tasks and initiatives.
7. International activities update.
8. Other business.
9. Closing.

B. The Subcommittee on Tank Filling Limits of the Chemical Transportation Advisory Committee (CTAC) will hold its meeting on Thursday, February 27, 1992 in room 1303, Coast Guard Headquarters, 2100 Second Street, SW., Washington, DC 20593. The meeting is scheduled to begin at 9:30 a.m. and end at 4 p.m. The Tank Filling Limits Subcommittee will continue its review of the proposal to change the filling limit requirements contained in the International Gas Code.

Attendance to both meetings is open to the public. Members of the public may present oral statements at the meetings. Persons wishing to present oral statements should notify the Executive Director of CTAC no later than the day before the meeting. Any member of the public may present a written statement to the Committee at any time.

FOR FURTHER INFORMATION CONTACT: Commander K.J. Eldridge or Mr. F.K. Thompson, U.S. Coast Guard Headquarter (G–MTH–1), 2100 Second Street SW., Washington, DC 20593, (202) 267–1217.

Dated: November 14, 1991.

Navigation Safety Advisory Council

AGENCY: Coast Guard, DOT.

ACTION: Notice of meeting.

As required by the Federal Advisory Committee Act, this notice announces a meeting of the Navigation Safety Advisory Council on Wednesday through Friday, December 11–13, 1991. The meeting will be held at the U.S. Coast Guard Reserve Training Center, Yorktown, VA. The Council will convene for a preliminary plenary session at 4 a.m. on Wednesday, December 11, 1991, in room 309, Hamilton Hall.

Committees will meet on Wednesday, December 11, from 8:30 to 11:30 a.m. and on Thursday, December 12 from 8 to 11 a.m. Committee discussions will include the following topics:

a. *Navigation Rules:*

1. Rule 23—Placement of masthead lights on vessels of 20 to 50 meters.

2. Rule 24—Proper lighting for barges being towed.

3. Rule 26—Lights and shapes displayed by vessels engaged in fishing.

4. Procedures for amending Inland/International Rules.

5. Consistency review of Navigation Rules.

b. *Routing Measures and Vessel Traffic Service (VTS) issues:*

1. National VTS regulations.

2. Review of Inland Rule 10 in relation to VTS, traffic separation schemes (TSS/'s) and International Rule 10.

3. Oil Pollution Act of 1990 mandated tanker movement study.

c. *Human Factors in Navigation Safety:*

1. Fatigue, work hours, and other human factors.

d, *Marine Information and Communications:*

1. Responsibility for maintaining approaches to commercial berths.

2. Metrication of charts.

e. *Ad hoc Committee:*

1. Evaluate the need to establish minimum under-the-keel clearance criteria.

The Council will convene in plenary session on Thursday, December 12 at 2:30 to 6:30 p.m. and reconvene on Friday, December 13 at 8 a.m. to hear Committee status reports and any matters properly brought before the Council.

The meeting is open to the public. Persons wishing to make oral statements should notify the Executive Director at the address below no later than Monday, December 9, 1991. Any person may present a written statement to the Council at any time without advance notice.

For additional information, contact Margie G. Hegy, Executive Director, Navigation Safety Advisory Council, U.S. Coast Guard (G–NSR–3), Washington, DC 20593–0001, Telephone (202) 267–0415.

Dated: November 20, 1991.

W. J. Ecker,

Rear Admiral, U.S. Coast Guard, Chief, Office of Navigation Safety and Waterway Services.

BILLING CODE 4830–01–M

Internal Revenue Service

[Delegation Order No. 155 (Rev. 3)]

Delegation of Authority

AGENCY: Internal Revenue Service, Treasury.

ACTION: Delegation of authority.

SUMMARY: This delegation order extends to all Associate Chief Counsels the authority, the matters under their respective jurisdictions, to sign recommendation letters to the Department of Justice concerning Settlement Offers for years or parties not in suit, but related to pending refund suits for other years or parties. In exercising this authority, the advice of the National Director of Appeals must be considered. The Associate Chief Counsels may redelegate this authority to their Deputies. The previous delegation order limited this authority to the Associate Chief Counsel (Litigation). That position was eliminated, effective October 1, 1991, as part of the reorganization of the Chief Counsel's Office, and the new positions of Associate Chief Counsels (Domestic), (Employee Benefits and Exempt Organizations), and (Enforcement Litigation) were created. The previous delegation order also required consideration of the advice of the Director, Tax Litigation Division (now the Assistant Chief Counsel (Tax Litigation). That requirement has been eliminated.

EFFECTIVE DATE: October 1, 1991.

FOR FURTHER INFORMATION CONTACT: Jody J. Brewster, Special Assistant to the Associate Chief Counsel (Domestic), 1111 Constitution Avenue, NW., room 3508, Washington, DC 20224, Tel. No. (202) 566–5850, (not a toll-free number).

Recommendations Concerning Settlement Offers in Refund Suits

[Order No. 155 (Rev. 3]

Effective date: 10–1–91.

1. Pursuant to the authority vested in the Commissioner of Internal Revenue by 26 CFR 301.7122–1 and 26 CFR 301.7701–9, the Chief Counsel and the Associate Chief Counsels are delegated the authority for matters under their respective jurisdictions to sign recommendation letters to the Department of Justice concerning Settlement Offers for years or parties not in suit, but related to pending refund suits for other years or parties. In exercising this authority, the advice of the National Director of Appeals shall be considered.

2. The authority delegated herein may not be redelegated, except that the Chief Counsel and the Associate Chief Counsels may redelegate the authority herein to their Deputy Associate Chief Counsels.

3. To the extent that the authority previously exercised consistent with this order may require ratification, it is hereby approved and ratified.

4. Delegation Order No. 155 (Rev. 2), issued June 17, 1982, is superseded.

Dated: October 15, 1991.

Michael J. Murphy,

Deputy Commissioner.

[FR Doc. 91-28509 Filed 11-26-91; 8:45 am]

BILLING CODE 4830-01-M

[Delegation Order No. 220 (Rev. 2)]

Delegation of Authority

AGENCY: Internal Revenue Service, DOT.

ACTION: Delegation of authority.

SUMMARY: This delegation order extends to the Assistant Chief Counsel (Disclosure Litigation) the authority to claim executive privilege with respect to Internal Revenue Service records and information in matters before the United States Claims Court, the United States Tax Court, and other Federal Courts. In the absence of or at the request of the Assistant Chief Counsel (Disclosure Litigation), the Deputy Assistant Chief Counsel (Disclosure Litigation) may exercise this authority in the name of the Assistant Chief Counsel (Disclosure Litigation). The previous delegation order extended this authority to the Director, Disclosure Litigation Division. The Director, Disclosure Litigation Division, has been renamed the Assistant Chief Counsel (Disclosure Litigation).

EFFECTIVE DATE: October 1, 1991.

FOR FURTHER INFORMATION CONTACT: Jody J. Brewster, Special Assistant to the Associate Chief Counsel (Domestic), 1111 Constitution Avenue, NW., room 3508, Washington, DC 20224, Tel. No. (202) 566-5850, (not a toll-free number).

Authority To Claim Executive Privilege in Matters Before the Claims Court, the Tax Court and Other Federal Courts

[Order No. 220 (Rev. 2)]

Effective Date: 10-1-91.

1. The authority vested in the Commissioner of Internal Revenue by Treasury Department Order 150-10 to claim executive privilege with respect to Internal Revenue Service records and information in matters before the United States Claims Court, the United States Tax Court, and other Federal Courts is hereby delegated, through the Chief Counsel and the Associate Chief Counsel (Enforcement Litigation), to the Assistant Chief Counsel, (Disclosure Litigation). In the absence of or at the request of the Assistant Chief Counsel (Disclosure Litigation), the Deputy Assistant Chief Counsel, (Disclosure Litigation), may exercise this authority in his/her name for the Assistant Chief Counsel (Disclosure Litigation). This authority may not be redelegated.

2. The Claims Court and certain other federal courts only recognize agency claims of executive privilege as the sole basis for protecting internal or inter-agency records that reflect recommendations, advisory opinions, and deliberations, comprising the process by which governmental decisions and policies are formulated. Executive privilege does not encompass those records whose disclosure would harm our national security or the conduct of international relations. These records fall within the government's states secrets privilege which is not delegated herein. With respect to these records, the Commissioner of Internal Revenue will claim the states secrets privilege.

3. Executive privilege may only be claimed for those Internal Revenue Service records and information that are predecisional and deliberative, the disclosure of which would significantly impede or nullify Internal Revenue Service actions in carrying out a responsibility or function, or would constitute an unwarranted invasion of personal privacy. Prior to asserting the claim of executive privilege with respect to the records described herein, coordination with the interested function(s) (including but not limited to the office of the Commissioner of Internal Revenue) shall be affected.

4. To the extent that the authority previously exercised consistent with this Order may require ratification, it is hereby approved and ratified.

5. Delegation Order No. 220 (Rev. 1), effective December 20, 1987, is superseded.

Dated: October 15, 1991.

Fred T. Goldberg, Jr.,

Commissioner.

[FR Doc. 91-28508 Filed 11-26-91; 8:45 am]

BILLING CODE 4830-01-M

[Delegation Order No. 97 (Rev. 30)]

Delegation of Authority

AGENCY: Internal Revenue Service, Treasury.

ACTION: Delegation of authority.

SUMMARY: This delegation order extends to all Associate Chief Counsels the authority, for matters under their respective jurisdictions, to enter into and approve a written agreement with any person relating to the Internal Revenue tax liability of that person for a taxable period ended prior to the date of agreement and related specific items affecting other taxable periods. The previous delegation order limited this authority to the Associate Chief Counsels (Technical) and (International). The position of Associate Chief Counsel (Technical) was eliminated, effective October 1, 1991, as part of the reorganization of the Chief Counsel's Office, and the new positions of Associate Chief Counsels (Domestic), (Employee Benefits and Exempt Organizations), and (Enforcement Litigation) were created. The revised delegation order also permits the Chief Counsel to redelegate any authority delegated to him under the delegation order to the Associate Chief Counsels and their Deputies and Assistant Chief Counsels for cases under their respective jurisdictions that do not involve precedent issues.

EFFECTIVE DATE: October 1, 1991.

FOR FURTHER INFORMATION CONTACT: Jody J. Brewster, Special Assistant to the Associate Chief Counsel (Domestic) 1111 Constitution Avenue, NW., room 3508, Washington, DC 20224, Tel. No. (202) 566-5850, (not a toll-free number).

DATES: Effective date: November 1, 1991.

Subject: Closing agreements concerning Internal Revenue Tax Liability.

[Amended and Supplemented by Delegation Order No. 225]

Pursuant to authority granted to the Commissioner of Internal Revenue by 26 CFR 301.7121-1(a); Treasury Order No. 150-07; Treasury Order No. 150-09; and Treasury Order No. 150-17, subject to the transfer of authority covered in Treasury Order No. 120-01, as modified by Treasury Order No. 150-27, as revised, this authority is hereinafter delegated.

1. The Chief Counsel is hereby authorized in cases under his/her jurisdiction to enter into and approve a written agreement with any person relating to the Internal Revenue tax liability of such person (or of the person or estate for whom he/she acts) in respect to any prospective transactions or completed transactions if the request to the Chief Counsel for determination or ruling was made before any affected returns have been filed.

2. The Associate Chief Counsels and the Assistant Commissioners (Examination) and (International) are hereby authorized for matters under their respective jurisdictions to enter into and approve a written agreement with any person relating to the Internal Revenue tax liability with any person relating to the Internal Revenue tax liability of such person (or of the person or estate whom he/she acts) for a

taxable period or periods ended prior to the date of agreement and related specific items affecting other taxable periods. The Assistant Commissioner (International) is also authorized to enter into and approve a written agreement with any person relating to the Internal Revenue tax liability of such person (or of the person or estate for whom he/she acts) with respect to the performance of his/her functions as the competent authority under the tax conventions of the United States.

3. The Assistant Commissioner (Employee Plans and Exempt Organizations) is hereby authorized to enter into and approve a written agreement with any person relating to the Internal Revenue tax liability of such person (or of the person or estate for whom he/she acts) in cases under his/her jurisdiction, that is, in respect of any transaction concerning employee plans or exempt organizations.

4. The Assistant Commissioner (International); Regional Commissioners; Regional Counsel; Assistant Regional Commissioners (Examination); Service Center Directors; Director, Austin Compliance Center; District Directors; Chiefs and Associate Chiefs of Appeals Offices and Appeals Team Chiefs with respect to his/her team cases, are hereby authorized in cases under their jurisdiction (but excluding cases docketed before the United States Tax Court) to enter into and approve a written agreement with any person relating to the Internal Revenue tax liability of such person (or of the person or estate for whom he/she acts) for a taxable period or periods ended prior to the date of agreement and related specific items affecting other taxable periods.

5. The Associate Chief Counsels; the Assistant Commissioners (Employee Plans and Exempt Organizations) and (International); Regional Commissioners; Regional Counsel; Chiefs and Associates Chiefs of Appeals Offices; and Appeals Team Chiefs with respect to his/her teams cases, are hereby authorized in cases under their jurisdiction docketed in the United States Tax Court and in other Tax Court cases upon the request of Chief Counsel or his/her delegate to enter into and approve a written agreement with any person relating to the Internal Revenue tax liability of such person (or of the person or estate for whom he/she acts) but only in respect to related specific items affecting other taxable periods.

6. The Assistant Commissioner (International) is hereby authorized to enter into and approve a written agreement with any person relating to the Internal Revenue tax liability of such person (or of the person or estate for whom he/she acts) in cases under his/her jurisdiction, and to provide for the mitigation of economic double taxation under section 3 of Revenue Procedure 64–54, C.B. 1964–2, under Revenue Procedure 72–22, C.B. 1972–1, 747, and under Revenue Procedure 69–13, C.B. 1969–1, 402, and to enter into and approve a written agreement providing the treatment available under Revenue Procedure 65–17, C.B. 1965–1, 833.

7. The authority delegated herein does not include the authority to set aside any closing agreement.

8. Authority delegated in this Order may not be redelegated, except that the Chief Counsel may redelegate the authority contained in paragraph 1 to the Associate Chief Counsels, the Deputy Associate Chief Counsels, and the Assistant Chief Counsels, for cases under their respective jurisdictions that do not involve precedent issues; the Assistant Commissioners (Examination) and (International) may redelegate the authority contained in paragraph 2 of this Order to the Deputy Assistant Commissioners (Examination) and (International); the Deputies Chief Counsel may redelegate the authority in paragraph 2 of this Order but not lower than the Deputy Associate Chief Counsels; and the Assistant Commissioner (Employee Plans and Exempt Organizations) may redelegate the authority contained in paragraph 3 of this Order to the Deputy Assistant Commissioner (Employee Plans and Exempt Organizations) and to the Technical Advisors on the Staff of the Assistant Commissioner (Employee Plans and Exempt Organizations) for cases that do not involve precedent issues; Service Center Directors and Director, Austin Compliance Center may redelegate the authority contained in paragraph 4 of this Order but not below the Chief, Examination Support Unit with respect to agreements concerning the administrative disposition of certain tax shelter cases; and not below the Chief; Windfall Profit Tax Staff, Austin Service Center or Austin Compliance Center with respect to entering into and approving a written agreement with the Tax Matters Partner/Person (TMP) and one or more partners or shareholders with respect to whether the partnership or S corporation, acting through its TMP, is duly authorized to act on behalf of the partners or shareholders in the determination of partnership or S corporation items for purposes of the tax imposed by chapter 45, and for purposes of assessment and collection of the windfall profit tax for such partnership or S corporation taxable year. The Assistant Commissioner (International) and District Directors may redelegate the authority contained in paragraph 4 of this Order but not below the Chief, Quality Review Staff/Section with respect to all matters, and not below the Chief, Examination Support Staff/Section, or Chief, Planning and Special Programs Branch/Section, with respect to agreements concerning the administrative disposition of certain tax shelter cases, or Chief, Special Procedures function, with respect to the waiver of right to claim refunds for those responsible officers who pay the corporate liability in lieu of a 100-percent penalty assessment under IRC 6672.

9. To the extent that the authority previously exercised consistent with this Order may require ratification, it is hereby affirmed and ratified.

10. Delegation Order No. 97 (Rev. 29) effective October 4, 1990, is hereby superseded.

Approved: October 15, 1991.

Michael J. Murphy,

Deputy Commissioner.

BILLING CODE 4830–01–M

[Delegation Order No. 96 (Rev. 11)]

Delegation of Authority

AGENCY: Internal Revenue Service, Treasury.

ACTION: Delegation of authority.

SUMMARY: This delegation order extends to all Associate Chief Counsels and their Deputies the authority, for matters under their respective jurisdictions, to describe the extent, if any, to which any ruling issued by or pursuant to authorization from the Chief Counsel relating to the internal revenue laws is applied without retroactive effect. The previous delegation order limited this authority to the Associate Chief Counsels (Technical) and (International) and the Deputy Associate Chief Counsel (Technical). The positions of Associate Chief Counsel (Technical) and Deputy Associate Chief Counsel (Technical) were eliminated, effective October 1, 1991, as part of the reorganization of the Chief Counsel's Office, and the new positions of Associate Chief Counsels (Domestic), (Employee Benefits and Exempt Organizations), and (Enforcement Litigation) and their Deputies were created.

EFFECTIVE DATE: October 1, 1991.

FOR FURTHER INFORMATION CONTACT: Jody J. Brewster, Special Assistant to the Associate Chief Counsel (Domestic), 1111 Constitution Avenue, NW., room

3508, Washington, DC 20224, Tel. No. (202) 566–5850, (not a toll-free number).

Effective Date: November 1, 1991.

Application of Rulings Without Retroactive Effect

1. Pursuant to authority granted to the Commissioner of Internal Revenue by 26 CFR 301.7805–1(b):

a. The Associate Chief Counsels and the Deputy Associate Chief Counsels are hereby authorized for matters under their respective jurisdictions to prescribe the extent, if any, to which any ruling issued by or pursuant to authorization from the Chief Counsel relating to the internal revenue laws shall be applied without retroactive effect.

b. The Assistant Commissioner (Employee Plans and Exempt Organizations) and the Deputy Assistant Commissioner (Employee Plans and Exempt Organizations) are hereby authorized to prescribe the extent, if any, to which any ruling issued by or pursuant to authorization from the Assistant Commissioner relating to the internal revenue laws shall be applied without retroactive effect.

2. a. Pursuant to authority granted to the Commissioner of Internal Revenue by 26 CFR 301.7805–1(b), there is hereby delegated to the Director, Employee Plans Technical and Actuarial Division of the National Office, and to the Director of each EP/EO Key District, the authority to limit the retroactive effect of the revocation of any determination letter or opinion letter issued with respect to employee plans if the conditions set forth in the Notice 86–3 are met;

b. Partial relief will be granted through section 7805(b) such as described in Notice 86–3.

3. The section 7805(b) authority described in sections 2a and 2b will be exercised except in rare and unusual circumstances. Where rare and unusual circumstances exist, denial of section 7805(b) relief will be applied only if approved by the National Office.

4. The authority delegated in section 1 may not be redelegated.

5. The authority to grant 7805(b) relief in certain employee plan matters herein delegated to the Director, Employee Plans Technical and Actuarial Division and to the Director of Qualifications Branch and Chief, EP/EO Division, respectively.

6. This delegation order expires with respect to the Director of each EP/EO Key District on December 31, 1989.

7. To the extent that the authority previously exercised consistent with this order may require ratification, it is hereby approved and ratified.

8. Delegation Order No. 96 (Rev. 10) effective February 23, 1988, is superseded.

Dated: October 15, 1991.

Michael J. Murphy,

Deputy Commissioner.

BILLING CODE 4830–01–M

[Delegation Order No. 42 (Rev. 25)]

Delegation of Authority

AGENCY: Internal Revenue Service, Treasury.

ACTION: Delegation of authority.

SUMMARY: This delegation order extends to all Associate Chief Counsels the authority, for matters under their respective jurisdictions, to sign all consents fixing the period of limitations on assessment or collection. In the previous delegation order, the only Associate Chief Counsels delegated this authority were the Associate Chief Counsels (Technical) and (International). The position of Associate Chief Counsel (Technical) was eliminated, effective October 1, 1991, as part of the reorganization of the Chief Counsel's Office, and the new positions of Associate Chief Counsels (Domestic), (Employee Benefits and Exempt Organizations), and (Enforcement Litigation) were created.

EFFECTIVE DATE: October 1, 1991.

FOR FURTHER INFORMATION CONTACT: Jody J. Brewster, Special Assistant to the Associate Chief Counsel (Domestic), 1111 Constitution Avenue, NW., room 3508, Washington, DC 20224, Tel. No. (202) 566–5850, (not a toll-free number).

DATES: Effective Date: October 1, 1991.

Authority To Execute Consents Fixing the Period of Limitations on Assessment or Collection Under Provisions of the 1939, 1954, and 1986 Internal Revenue Codes

1. Pursuant to authority vested in the Commissioner of Internal Revenue by Treasury Order 150–10; 26 U.S.C. 6229; 26 CFR 301.6501(c)–1; 26 CFR 301.6502–1; 26 CFR 301.6901–1(d); and 26 CFR 301.7701–9; the authority to sign all consents fixing the period of limitations on assessment or collection is delegated to the following officials:

a. Associate Chief Counsels (for matters under their respective jurisdictions);

b. Assistant Commissioner (International);

c. Assistant Commissioner (Employee Plans and Exempt Organizations) but limited to Form 872–C, Consent Fixing Period of Limitation Upon the Assessment of Tax Under section 4940 of the Internal Revenue Code;

d. Regional Counsel;

e. Regional Directors of Appeals;

f. Service Center Directors;

g. Director, Austin Compliance Center; and

h. District Directors.

2. This authority may be redelegated but not below the following levels for each activity:

a. Service Centers—Chief, Accounting Branch; Chief, Quality Assurance; Chief, Adjustment/Correspondence; Revenue Officers and Collection Branch managers Grade GS–9 or higher; Chief, Classification function; and personnel assigned to the Examination Support Unit, Grade GS–11 or higher;

b. Austin Compliance Center-Underreporter Division-Branch Chiefs; Collection Division-all Branch Chiefs and Chief, Quality Analysis Staff; Examination Division-Chiefs, Examination Branches, Chief, Quality Assurance Staff, Chief, Classification Branch; and personnel assigned to the Windfall Profits Staff, GS–11;

c. Collection-Revenue Officers; Collection Support function managers Grade GS–9 or higher; Automatic Collection Branch managers, Grade GS–9 or higher;

d. Examination-Reviewers, Grade GS–11 or higher; Group managers (including large case managers); Chiefs, Planning and Special Programs and personnel assigned thereto Grade GS–11 or higher; Returns Classification Specialists and Returns Classification Officers Grade GS–11;

e. Criminal Investigation-Chiefs, Criminal Investigation Divisions, except in those districts where the Criminal Investigation Group managers report directly to the District Directors, the authority is limited to the District Director.

f. Appeals—Appeals Officers;

g. Assistant Commissioner (International)—Representatives at foreign posts; Revenue Agents, Tax Auditors, and Special Agents on foreign assignments; and levels indicated in c, d, and e, above;

h. EP/EO—For Form 872–2, Exempt Organizations Technical Division Group Managers Conferee/Reviewers and

i. District Employee Plans and Exempt Organizations—Reviewers, Grade GS–11 or higher; and Group Managers.

3. No authority is delegated under this Order to the District Counsel.

4. To the extent that the authority previously exercised consistent with this order may require ratification, it is hereby approved and ratified.

5. Delegation Order No. 42 (Rev. 24), effective February 8, 1991, is superseded

Dated: October 15, 1991.

BILLING CODE 4830-01-M

[Delegation Order No. 11 (Rev. 21)]

Delegation of Authority

AGENCY: Internal Revenue Service, Treasury.

ACTION: Delegation of authority.

SUMMARY: This delegation order extends to all Associate Chief Counsels the authority, for matters under their respective jurisdictions, to accept offers in compromise and to reject offers in compromise, regardless of the amount of the liability sought to be compromised. In the previous delegation order, the only Associate Chief Counsels delegated this authority were the Associate Chief Counsels (Technical) and (International). The position of Associate Chief Counsel (Technical) was eliminated, effective October 1, 1991, as part of the reorganization of the Chief Counsel's Office, and the new positions of Associate Chief Counsels (Domestic), (Employee Benefits and Exempt Organizations), and (Enforcement Litigation) were created.

EFFECTIVE DATE: October 1, 1991.

FOR FURTHER INFORMATION CONTACT: Jody J. Brewster, Special Assistant to the Associate Chief Counsel (Domestic) 1111 Constitution Avenue NW., room 3508, Washington, DC 20224 Tel. No. (202) 566-5850, (not a toll-free number).

Authority to Accept or Reject Offers in Compromise

The authority vested in the Commissioner of Internal Revenue by Treasury Order Nos. 150-04 and 150-09, 26 CFR 301.7122-1, and 26 CFR 301.7701-9 and Treasury Order No. 150-13 is hereby delegated as follows:

1. The Deputy Assistant Commissioner (International), Associate Chief Counsels, Assistant District Directors, Regional Counsel, Chiefs and Associate Chiefs, Appeals Offices, are delegated authority, under section 7122 of the Internal Revenue Code, to accept offers in compromise and to reject offers in compromise for matters under their respective jurisdictions regardless of the amount of the liability sought to be compromised. This authority does not pertain to offers in compromise of liabilities arising under laws relating to alcohol, tobacco, and firearms taxes. The authority delegated to District Directors may not be redelegated lower than Division Chief; except that the authority with respect to the withdrawal of an offer in compromise based upon doubt as to collectibility may be redelegated to Chief, Special Procedures. The authority delegated to Regional Counsel may not be redelegated, except that the authority to reject offers in compromise may be redelegated, but not lower than to District Counsel. Regional Director of Appeals, Chiefs and Associate Chiefs, Appeals Offices, may not redelegate this authority.

2. Assistant Service Center Directors and Assistant Director, Austin Compliance Center are delegated authority, under section 7122 of the Internal Revenue Code, to accept offers in compromise, limited to penalties based solely on doubt as to liability, and to reject offers in compromise, limited to penalties, regardless of the amount of the liability sought to be compromised, and to summarily rejected without further investigation, offers based solely on doubt as to liability regardless of the amount of the liability sought to be compromised, limited to obvious offers that are frivolous, groundless or dilatory, or where the liability has been finally determined by the Tax Court or other courts, or by a Commissioner's final closing agreement, or where the offer is based upon an agreed liability in which administrative appeal rights have been exercised or waived. This authority does not pertain to offers in compromise of liabilities arising under laws relating to alcohol, tobacco, and firearms taxes. This authority may be redelegated only to the Chief, Compliance Division (Service Centers) and Chief, Collection Division (Austin Compliance Center).

3. To the extent that the authority previously exercised consistent with this Order may require ratification, it is hereby approved and ratified.

4. Delegation Order No. 11 (Rev. 20), effective October 4, 1990, is superseded.

Dated: October 15, 1991.

Brookings Federal Bank, a Federal Savings Bank, Brookings, SD: Final Action; Approval of Conversion Application

Notice is hereby given that on November 12, 1991, the Office of the Chief Counsel, Office of Thrift Supervision, acting pursuant to delegated authority, approved the application of Brookings Federal Bank, a federal savings bank, Brookings, South Dakota for permission to convert to the stock form of organization. Copies of the application are available for inspection at the Information Services Division, Office of Thrift Supervision, 1776 G Street, NW., Washington, DC 20552, and the Des Moines Area Office, Office of Thrift Supervision, Regency West 2, 1401 50th Street, suite 300, West Des Moines, Iowa 50265–5924.

Dated: November 21, 1991.

By the Office of Thrift Supervision.

Nadine Y. Washington,

Corporate Secretary.

Sunshine Act Meetings

Federal Register
Vol. 56, No. 229
Wednesday, November 27, 1991

This section of the FEDERAL REGISTER contains notices of meetings published under the "Government in the Sunshine Act" (Pub L 94-409) 5 U.S.C. 552b(e)(3).

NATIONAL WOMEN'S BUSINESS COUNCIL

ACTION: Notice of Hearing

SUMMARY: In accordance with the Women's Business Ownership Act, Public Law 100–533 as amended, the National Women's Business Council announces a forthcoming hearing. The focus of the hearing will be to hear testimony and gather information regarding women's contributions in high technology. Testimony will be received from public and private sector decisionmakers and entrepreneurs, professional experts, corporate leaders and representatives of key interest groups and organizations.

DATE: December 6, 1991, 9:00 am to 5:00 pm.

ADDRESS: University of Texas at Arlington, Room 100, Engineering Building II, 416 Yates Street.

STATUS: Open to the public.

CONTACT: For further information or to submit written testimony only, contact Wilma Goldstein, Executive Director or Diane Cullo, Legislative Analyst, National Women's Business Council, 2100 Pennsylvania Avenue, NW, # 690, Washington, DC 20037, (202) 254–3850. Deadline date for submission of written testimony is December 9, 1991.

Wilma Goldstein,

Executive Director, National Women's Business Council.

NATIONAL WOMEN'S BUSINESS COUNCIL

AGENCY: National Women's Business Council.

SUMMARY: In accordance with the Women's Business Ownership Act, Public Law 100–533 as amended, the National Women's Business Council announces a forthcoming meeting and roundtable discussion. The roundtable discussion will center on examination of barriers to women in high technology as well as offer recommendations that could overcome these barriers. Meeting issues to be discused are the annual report and various Council office administrative issues.

DATE:

December 7, 1991, 9:00 am–12:00 noon. (Roundtable).

December 7, 1991, 1:00 pm–4:00 pm. (Meeting)

PLACE:

University of Texas at Arlington, Rady Room (6th floor), Engineering II Building, 416 Yates Street. (Roundtable only)

Radisson Suite Hotel-Arlington, 700 Avenue H East, Arlington, TX 76011. (Meeting location only)

STATUS: Both meeting and roundtable are open to the public.

CONTACT: Wilma Goldstein, Executive Director or Diane Cullo, Legislative Analyst, National Women's Business Council 2100 Pennsylvania Avenue, NW, #690, Washington DC, 20037, (202) 254–3850.

Wilma Goldstein,

Executive Director, National Women's Business Council.

Nutrition Labeling of Meat and Poultry Products; Proposed Rule

DEPARTMENT OF AGRICULTURE

Food Safety and Inspection Service

9 CFR Parts 317, 320, and 381

[Docket No. 91-006P]

RIN 0583-AB34

Nutrition Labeling of Meat and Poultry Products

AGENCY: Food Safety and Inspection Service, USDA.

ACTION: Proposed rule.

SUMMARY: The Food Safety and Inspection Service (FSIS) is proposing to amend the Federal meat and poultry products inspection regulations by permitting voluntary nutrition labeling on single-ingredient, raw meat and poultry products, and by establishing mandatory nutrition labeling for all other meat and poultry products, with the exception of products used for further processing. Under the mandatory nutrition labeling program, processors of products in small packages and products packaged in other than consumer-size packages shall have the option of providing nutrition labeling information either on the package or by alternate means. Food and Drug Administration (FDA) is undertaking various regulatory proceedings to comply with the Nutrition Labeling and Education Act of 1990, which requires mandatory nutrition labeling of most foods under FDA's jurisdiction. FSIS is committed to providing consumers with the most informative labeling system possible. FSIS is proposing nutrition labeling regulations for meat and poultry products which will parallel, to the extent possible, as authorized by the FMIA and the PPIA, FDA's nutrition labeling initiatives. However, FSIS is also seeking comments on alternatives to mandatory nutrition labeling and the extent to which FSIS requirements must duplicate or complement new FDA requirements to maximize informative labeling in a cost effective manner.

DATES: Comments must be received on or before February 25, 1992.

ADDRESSES: Written comments to: Policy Office, ATTN: Linda Carey, FSIS Hearing Clerk, Room 3171, South Building, Food Safety and Inspection Service, U.S. Department of Agriculture, Washington, DC 20250. Oral comments as provided by the Poultry Products Inspection Act should be directed to Mr. Charles Edwards at (202) 205-0080. (See also "Comments" under "**SUPPLEMENTARY INFORMATION.**")

FOR FURTHER INFORMATION CONTACT: Mr. Charles Edwards, Director, Food Ingredient Assessment Division, Regulatory Programs, Food Safety and Inspection Service, U.S. Department of Agriculture, Washington, DC 20250, (202) 205-0080.

SUPPLEMENTARY INFORMATION:

Regulatory Impact Analysis

This proposed action has been reviewed under USDA procedures established to implement Executive Order 12291 and has been classified as a major rule pursuant to section 1(b)(1) of that order because it is likely to result in an annual effect on the economy of $100 million or more. The Department's review is reported in its Preliminary Regulatory Impact Analysis (PRIA), which is published in its entirety as an appendix to this proposal. The PRIA also satisfies the analysis requirements of the Regulatory Flexibility Act (Pub. L. 96-354, 5 U.S.C. 601 *et seq.*), which deals with the effect on small entities.

Paperwork Requirements

This proposal would require manufacturers to maintain records supporting the validity of nutrient information on the labels of meat and poultry products, and to make such records available to FSIS upon request. This proposal would require establishments to establish and maintain a partial quality control program for products labeled with nutrient content claims. Furthermore, the proposal would require most currently approved labels for all meat and poultry products, except for single-ingredient, raw products, to be revised and submitted to FSIS for approval, which would impact substantially on all such manufacturers. Manufacturers of single-ingredient, raw meat and poultry products opting to use nutrition labeling would also be required to revise their labels and comply with requirements of the mandatory program. The PRIA, attached as an appendix to this proposal, includes a cost analysis of nutrition labeling. The paperwork requirements contained in this proposal have been submitted to the Office of Management and Budget for approval under the Paperwork Reduction Act (44 U.S.C. 3501 *et seq.*). If you wish to comment on the paperwork burden of this proposed rule, send your comments to: Office of Management and Budget, Desk Officer for FSIS, Office of Information and Regulatory Affairs, room 3208, New Executive Office Building, Washington, DC 20503 and to the Clearance Office, Room 404-W, Administration Building, Washington, DC 20250.

Comments

Interested persons are invited to submit written comments concerning this proposal and the Preliminary Regulatory Impact Analysis (PRIA). FSIS plans to publish a supplement to the PRIA for public comment within 60 days of this proposal. The Agency is particularly interested in receiving early comments on the original PRIA and on the questions raised on alternatives later in this document to facilitate formulation of the supplementary document.

Written comments should be sent to the Policy Office at the address shown above and should refer to Docket Number 91-006P. Any person desiring an opportunity for an oral presentation of views as provided by the Poultry Products Inspection Act should make such request to Mr. Edwards so that arrangements can be made for such views to be presented. A transcript will be made of all views orally presented. All comments submitted in response to this proposal will be available for public inspection in the Policy Office from 9 a.m. to 12:30 p.m., and from 1:30 p.m. to 4 p.m., Monday through Friday.

Background

Introduction

The Federal Meat Inspection Act (FMIA) (21 U.S.C. 601 *et seq.*) and the Poultry Products Inspection Act (PPIA) (21 U.S.C. 451 *et seq.*) authorize the Secretary of Agriculture to establish and maintain inspection programs designed to assure consumers that meat and poultry products distributed in commerce or within designated States are wholesome, not adulterated, and are properly marked, labeled, and packaged.

FSIS regulates the labeling of meat and poultry products while FDA has responsibility over all other food labeling. FSIS conducts a prior label approval program under which labeling to be used on, or in conjunction with, meat and poultry products must be approved by the Agency prior to their use. FDA, on the other hand, relies primarily upon food manufacturers to comply with prescribed labeling regulations and to ensure that information contained on food labels is truthful and not misleading.

FSIS also develops standards of identity or composition for certain meat and poultry products under section 7(c) of the FMIA (21 U.S.C. 607(c)) and section 8(b) of the PPIA (21 U.S.C. 457(b)). Under these authorities, FSIS has promulgated regulations prescribing standards of identity and composition. FSIS also has promulgated regulations

prescribing the content and design of labels.

In 1973, FDA adopted a regulation, recodified in 1977 as 21 CFR 101.9, prescribing a specific labeling format to be included on food product labels when voluntary or mandatory nutrition information is provided. Currently required components that must be addressed include calories, protein, carbohydrates, fat, sodium, two mineral elements (calcium and iron), and five vitamins (vitamin A, vitamin C, thiamin, riboflavin, and niacin). FSIS disseminates its nutrition labeling guidelines for meat and poultry products through the issuance by its Standards and Labeling Division of various policy memoranda.[1] One policy memorandum provides that nutrition information for nutrient content may be presented in the format and style described in 21 CFR 101.9 for the required components. This memorandum also permits an abbreviated labeling format for the nutrient content of meat and poultry products that includes calories, protein, carbohydrates, fat and/or sodium. In addition, FSIS permits other types of nutrition information to be presented, such as percentage fat-free claims. All policies on nutrition information outlined in these memoranda would no longer be in effect upon promulgation of this proposed regulation as a final rule. The policy memoranda that would require rescindment or revision include the following:

1. Policy Memo 46, April 1982, Percent Fat Free Label Declarations
2. Policy Memo 39, January 1982, Caloric Claims/Weight Reduction
3. Policy Memo 49c, June 1984, Sodium Labeling Guidelines
4. Policy Memo 69, March 1984, Labeling for Substitute Products
5. Policy Memo 70B, November 1987, Fat and Lean Claims
6. Policy Memo 71A, March 1986, Lite and Similar Terms
7. Policy Memo 74A, November 1986, Exemptions from NLV or PQC
8. Policy Memo 78, November 1984, Potassium Labeling Guidelines
9. Policy Memo 85B, January 1988, NLV Procedures
10. Policy Memo 86, May 1985, Nutrition Labeling
11. Policy Memo 114, July 1988, Point of Purchase Materials

Marketing Trends

Consumers are becoming increasingly aware of diet, health, and nutrition, and are concerned about the nutrient content of their foods. As a result, food manufacturers are adding nutrient content claims to allow consumers to make more informed food purchases. Claims such as "lean", "low fat", and "low cholesterol" have become common in today's marketplace. The use of such terms is subject to various interpretations and may mislead the consumer when purchasing products so labeled.

Nutrition Labeling Endeavors

The issue of providing consumers with more accurate and informative labeling has prompted a series of undertakings by various segments of the Federal government to provide more nutrition information on the labels of all foods. These endeavors are summarized below, most of which are further addressed in this document under the major issues of nutrition labeling.

1. Congressional Action

On November 8, 1990, the Nutrition Labeling and Education Act of 1990 (NLEA), which amended certain provisions of the Federal Food, Drug, and Cosmetic Act, was enacted (Pub. L. 101–535; 104 Stat. 2353).[2] The NLEA requires mandatory nutrition labeling for most FDA-regulated packaged food products. It also requires FDA to issue voluntary nutrition guidelines to food retailers for providing nutrition information on 20 of each of the most frequently consumed, during a year, varieties of raw vegetables, raw fruits, and raw fish. Should food retailers fail to comply substantially with the guidelines, the NLEA requires FDA to issue mandatory requirements for these commodities.

2. FDA Regulatory Initiatives

In August 1989, FDA issued an advance notice of proposed rulemaking (ANPR) requesting comments on a wide range of labeling issues to determine what changes, if any, should be made on the labeling of foods regulated by FDA (54 FR 32610). In September 1989, FDA issued a notice of an extension of the comment period on the ANPR and announced a series of public hearings to be held throughout the Nation on food labeling (54 FR 38806). FSIS participated in these hearings, which were conducted by FDA in the fall of 1989. Issues discussed at the hearings related to nutrition labeling, ingredient labeling, descriptions of food, health messages, and nutrition label format.

After consideration of various comments received, FDA published a reproposed rule on February 13, 1990, on health messages (55 FR 5176), and three proposed rules on July 19, 1990, that would establish provisions on daily values for use in declaring nutrient content in nutrition labeling (55 FR 29476), require mandatory nutrition labeling on most food products that are meaningful sources of calories or nutrients (55 FR 29487), and define serving and portion sizes (55 FR 29517). FDA also published a tentative final rule on July 19, 1990 (55 FR 29456), prescribing regulations that define and provide for the use of the terms "cholesterol free", "low cholesterol", and "reduced cholesterol" in the labeling of foods.

The NLEA, as previously discussed, was enacted in November 1990, several months after FDA published its proposed rules and tentative final rule on food labeling. As a result, on January 11, 1991, FDA published a notice (56 FR 1151) recognizing the impact of the NLEA on its pending rulemaking proceedings dealing with food labeling. FDA announced its plans to obtain comments in some form, or issue reproposals or supplemental proposals in some form, to ensure that all such regulations are consistent with the NLEA. These reproposals and supplement proposals are discussed in detail in this document.

3. NAS Study

In 1989, FSIS and the Public Health Service, U.S. Department of Health and Human Services (HHS), which includes FDA, jointly sponsored a study by the Institute of Medicine (IOM) of the National Academy of Sciences (NAS), to provide options for improving food labeling. In its 1990 final report, NAS recommended that FSIS and FDA mandate nutrition labeling for all packaged foods under their respective jurisdictions, except for certain exemptions.[3] In addition, NAS presented recommendations on various facets of nutrition labeling including nutrition label content, serving sizes, U.S. Recommended Daily Allowances, adjectival descriptors, and ingredient labeling.

4. Serving Size Meeting

On April 4, 1991, FSIS participated in a FDA public meeting on food labeling

[1] Copies of FSIS policy memoranda on nutrition labeling are available for public review in the FSIS Hearing Clerk's office. Copies may be obtained, without charge, from the FSIS Hearing Clerk.

[2] The NLEA is available for public review in the FSIS Hearing Clerk's office. Copies may be obtained, without charge, from the FSIS Hearing Clerk.

[3] The NAS final report titled "Nutrition Labeling: Issues and Directions for the 1990s" is available for public review in the FSIS Hearing Clerk's office. Copies of the report are available for sale from the National Academy Press, 2101 Constitution Avenue, NW., Washington, DC 20418.

to discuss five major issues relating to serving size: (1) The basis for determining serving size, (2) units of measure to be used, (3) deviation allowed from standard serving sizes, (4) dual nutrition labeling with the second column on the basis of uniform weight, and (5) the definition of single-serving container. One recommendation expressed by all the participants was that USDA and FDA should work in harmony to establish uniform serving sizes for the foods the agencies regulate. In response to this, FSIS participated as a member of an Interagency Committee on Serving Sizes formed by FDA to ensure consistency in serving size requirements for all foods. The committee's recommendations and objectives are further discussed in this document under section V, Serving Sizes.

Advance Notice of Proposed Rulemaking

On April 2, 1991, FSIS published an ANPR to solicit comments and recommendations from consumers, industry, public health officials, and other interested parties to assist the Agency in developing proposed regulations for nutrition labeling of meat and poultry products (56 FR 13564). In the ANPR, the Agency announced its intent to propose mandatory nutrition labeling regulations for most processed meat and poultry products and a voluntary program for fresh meat and poultry products. FSIS identified the following eight major food labeling issues that are of particular concern to the Agency: (1) Mandatory nutrition labeling, (2) nutrition label content, (3) U.S. Recommended Daily Allowances, (4) serving size, (5) descriptors and health messages, (6) food ingredients and standards of identity, (7) compliance and analytical methods, and (8) economic impact.

FSIS received 197 comments in response to the ANPR. The majority of these comments (96) were submitted by food manufacturers and distributors, while 30 comments were received from trade associations; 21 from consumers and consumer groups; 8 from State governments; 7 from health professionals; 6 from Congressional offices on behalf of small businesses; 5 from professional organizations; 5 from academia; 5 from consultants; 3 from retailers; 2 from import/export manufacturers; 2 from foreign governments; 1 from the Federal Government; and 1 from a local government. Five other comments received did not address the scope of the ANPR. The following discussion includes a summary of the comments received and the Agency's proposed regulations on each major issue.

It must be noted that because of the distinct labeling responsibilities of FSIS and FDA and the differences in the products regulated by each, some labeling differences between the two agencies continue to exist; thereby making absolute uniformity impossible. Furthermore, FSIS has attempted to parallel its proposed regulations as closely as possible to FDA's proposed regulations on nutrition labeling. This proposal was based primarily in response to comments from consumers and the industry to provide consistent nutrition labeling for all foods. Nonetheless, FSIS is interested in receiving comments addressing areas where the nutrition labeling of meat and poultry products should differ from other foods. For example, consumers may desire more detailed information on types of fat contained in meat and poultry products, or prefer a different threshold for descriptors such as "low fat" for meat and poultry than for other food products.

I. Alternatives Considered

FSIS considered several major alternatives during the course of its development of this proposed rule. (The Preliminary Regulatory Impact Analysis contains a more indepth discussion of these alternatives.) Each alternative is presented below with the Agency's reasons for selecting the favored alternative.

FSIS is interested in receiving comments on all alternatives discussed below, and on the issues that will be important on its choice among these alternatives. Such comments will be given serious consideration in the Agency's decision on a final rule. The first key issue is whether to make labeling mandatory for all or part of the industry. Mandatory labeling imposes certain costs on manufacturers, but may or may not confer benefits on consumers. For example, full mandatory labeling will ensure that all foods are labeled, but the increase in labeling may be of little value given that only a fraction of consumers currently read labels. Requiring labeling may force manufacturers to upgrade the quality of their foods rather than to reveal their poor nutrition content. On the other hand, the existence of a label may serve as a convenient and efficient signal that nutritional quality is higher for labeled foods than for unlabeled foods.

Another major issue is the extent to which special circumstances in the markets for meat and poultry relative to foods regulated by FDA might suffice to justify a difference between the regulatory approach pursued by FSIS and that pursued by FDA. The absence of a statutory mandate for this rule gives FSIS an opportunity to craft rules which serve the special needs of consumers and producers in meat and poultry markets. To exploit such an opportunity, FSIS would like to know whether special circumstances might suggest an independent approach on a variety of issues such as definitions for descriptors, relative claims, and comparative claims.

A third issue is the extent to which the issue of labeling reform is complicated by the USDA's system of prior label approval. The costs of labeling reform for the Department of Agriculture may be different than those for FDA, even correcting for the number of labels and the value of the potential dietary changes, because of the prior label approval. Could the cost effectiveness of this proposed rule be improved by abandoning the requirement of prior label approval?

1. Maintain Existing Policy

Approximately 35 to 50 percent of the meat and poultry firms voluntarily provide nutrition labeling on their products. FSIS currently approves labels that contain nutrition labeling in the format and style provided by FDA regulations or in an abbreviated format that includes calories, protein, carbohydrates, and fat in a specified serving of the product.

This alternative would result in the presence of two labeling schemes, three counting the abbreviated format. This alternative is provided to serve as a baseline for considering the other alternatives.

2. Establish a Voluntary Program Parallel to FDA

The second alternative was to establish a voluntary nutrition labeling program that parallels FDA regulations. Under such a program, meat and poultry firms would have the continued option of providing nutrition labeling, but would be required to follow FDA regulations on all elements of nutrition labeling. This alternative would require those firms opting to provide nutrition labeling to revise their labels according to FDA's proposed regulations on nutrition labeling.

3. Establish Voluntary Program With Incentives

This alternative involved the establishment of a voluntary nutrition labeling program for all meat and poultry products with incentives to offer those firms that choose to participate.

FSIS considered incentives such as use of an abbreviated nutrition label format, free or subsidized product analyses to small businesses, and centrally printed standardized materials.

FSIS seeks input as to other incentives that may be considered under a voluntary program.

4. Establish Mandatory/Voluntary Programs Parallel to FDA

The fourth alternative was the tentative position presented in FSIS's April 2, 1991, advance notice of proposed rulemaking on nutrition labeling. The alternative would require nutrition labeling for all meat and poultry products, except single-ingredient, raw products, which could contain nutrition labels at the firm's discretion. All nutrition labeling, whether mandatory or voluntary, would be required to follow FSIS's and FDA's proposed regulations on nutrition labeling.

This is the alternative selected by the Agency in this proposed rulemaking. FSIS has tentatively concluded that consumers should be provided nutrition labeled products to the extent possible for all foods. Because the nutrient values of single-ingredient, raw meat and poultry products are not modified through various stages of preparation, such as cooking and heat processing, FSIS believes that consumers have reasonable expectations as to the nutritional qualities of such products. However, the nutrient content of other products vary significantly depending upon the method of preparation and the addition of ingredients, such as preservatives and spices.

5. Establish a Mandatory Program For All Products

The final alternative considered was to establish a mandatory program for all meat and poultry products consistent with FDA's regulations. This alternative would provide consistent nutrition labeling for all foods. FSIS believes that a mandatory program for single-ingredient, raw meat and poultry products would not be necessary for the reasons set forth in the preceding section.

II. Mandatory Nutrition Labeling

A. Background

FSIS requires food manufacturers to obtain prior approval for the content and design of labeling for meat and poultry products before the products may be marketed. FSIS permits and encourages voluntary nutrition labeling using formats set forth in Agency policy memoranda. Approximately 35 to 50 percent of processed, packaged meat and poultry products currently bear nutrition labeling. FSIS requires manufacturers to provide nutrition data to substantiate nutrition claims. Additional information, when necessary to facilitate consumer understanding of these claims, is required.

NAS recommended that FSIS promulgate regulations that require nutrition labeling for most packaged foods under USDA's jurisdiction, including institutional-size packages and commodities distributed through USDA food programs, and the 20 to 30 top items of fresh/frozen meat and poultry products. NAS suggested that values for the latter be provided by using point-of-purchase information developed from data base values. Among exemptions from mandatory nutrition labeling specified in the NLEA are persons who offer food for sale and have annual gross sales to consumers which are not more than $500,000 or have annual gross sales made or business done in sales of food to consumers of not more than $50,000, with respect to food offered by such person to consumers.

The NLEA further exempts manufacturers from providing nutrition information on the label of certain small packages and food which is sold by a food distributor if the food distributor principally sells food to restaurants or other establishments in which food is served for immediate food consumption and does not manufacture, process, or repackage the food it sells. NAS suggests excluding only small packages, and foods that have no nutritional significance and that do not make a claim with respect to nutritional value.

B. Discussion of Comments and Proposal

FSIS proposes to establish nutrition labeling regulations for meat, poultry, and products therefor to be as similar as possible to those established by FDA, which regulates all other foods. As previously discussed, FDA is undertaking various regulatory proceedings to comply with the NLEA, which requires mandatory nutrition labeling of most foods under FDA's jurisdiction. FSIS is proposing to: (1) Establish mandatory nutrition labeling on an "as packaged" basis for meat and poultry products, except single-ingredient, raw products; (2) permit voluntary nutrition labeling on single-ingredient, raw meat and poultry products on an "as packaged" or "as consumed" basis; (3) permit nutrition labeling information on the package or by alternate means for products, except single-ingredient, raw products, packaged in small packages and in other than consumer-size packages; (4) exempt meat and poultry products intended for further processing from nutrition labeling requirements; (5) incorporate point-of-purchase materials in the voluntary program; and (6) evaluate significant participation by food retailers in the voluntary nutrition labeling program.

1. Mandatory Nutrition Labeling

FSIS has determined that it has statutory authority to require nutrition labeling based on the Secretary of Agriculture's determination that meat and poultry products, other than single-ingredient, raw products, would be misbranded in the absence of such information on the label, under section 1(n) of the Federal Meat Inspection Act (21 U.S.C. 601(n)(1)) and section 4(h) of the Poultry Products Inspection Act (21 U.S.C. 453(h)(4)).

In the ANPR, the Agency announced its intention to establish mandatory nutrition labeling for most processed meat and poultry products, and to permit voluntary nutrition labeling for major cuts of fresh meat and poultry products. FSIS considered processed meat and poultry products and fresh meat and poultry products separately because of differences in the production and marketing practices of the two types of products.

A majority of the commenters supported the Agency's position. Commenters that did not support the Agency's position were equally divided in supporting either a total mandatory program or a total voluntary program. Manufacturers and distributors tended to support a total voluntary program while consumer advocate groups tended to support a total mandatory program. Small manufacturers expressed opposition to nutrition labeling because of concern regarding the expenditures for analysis and relabeling.

After reviewing the various comments received, FSIS is proposing to permit voluntary nutrition labeling on single-ingredient, raw meat and poultry products, including those that have been previously frozen, and to establish mandatory nutrition labeling on all other meat and poultry products, except products intended for further processing. Products such as ground beef, chicken breasts, and whole turkey would be in the voluntary program. Other products such as pumped turkey, chicken franks, corned beef, and meat burritos would be in the mandatory program.

2. Exemptions

In the ANPR, the Agency's tentative position was to exempt small

businesses, very small packages, and foods that are to be used in further processing. Commenters strongly supported the Agency's position on providing exemptions for all of these situations.

The NLEA exempts a food from nutrition labeling if it is offered for sale by a person who has annual gross sales to consumers which are not more than $500,000, or annual gross sales made or business done in sales of food to consumers of not more than $50,000. However, FSIS believes that the principal issue involves costs associated with compliance of nutrition labeling, and, in lieu of a small business exemption, is considering various mechanisms to minimize compliance costs for all businesses. This may include provisions for the combined use of data base and theoretical calculations of nutrient content for lines of products with minor formulation differences. FSIS seeks comments on any other mechanisms which could minimize the cost of providing nutrition labeling, especially for small businesses.

Several commenters recommended using net weight as the standard to define small packages. FSIS currently allows certain exemptions for individually wrapped packages of less than 1/2 ounce net weight. Therefore, FSIS believes it is appropriate to define small packages as individually wrapped packages of less than 1/2 ounce net weight.

The NLEA provides an exemption from nutrition labeling on the labels of foods that are in packages so small that it is impractical to comply with the statutory requirements, and that do not contain any nutrition information. The NLEA says nothing about the labeling. FDA proposes to require that nutrition information for food in very small packages be provided through alternative means, such as on placards or through display of the label for the container in which small packages are shipped.

FSIS believes it is desirable to provide consumers with nutrition information on all meat and poultry products, except for single-ingredient, raw products. Provided that no nutrition claim is made on the label, FSIS is proposing to allow nutrition information for small packages and for other than consumer-size packages to be provided by labeling means other than a nutrition panel on the package. A nutrition claim is any word or phrase, in a location on the label other than in the nutrition panel, that expressly or by implication characterizes the level of a nutrient contained in a product. If a nutrition claim is made on the label of small packages or other than consumer-size packages, all nutrition labeling requirements must be satisfied by printing the information on the label.

FSIS is proposing to exempt from nutrition labeling requirements those meat and poultry products intended for further processing, such as bulk sliced pepperoni to be used on pizza. The rationale for this exemption is that household consumers will not see nutrition information appearing on these products because such products are not sold directly to household consumers.

3. Voluntary Nutrition Labeling

FSIS is proposing to permit voluntary nutrition labeling on single-ingredient, raw meat and poultry products, including those that have been previously frozen. When manufacturers elect to provide nutrition information on the label of these products, such products and their labels would be subject to all requirements prescribed for the mandatory nutrition labeling program, except that nutrition labeling for the voluntary program may be declared on the basis of "as consumed" or "as packaged." FSIS believes that a voluntary nutrition labeling program for single-ingredient, raw meat and poultry products may be the best approach. Single-ingredient, raw products undergo minimal preparation, such as cut up, and contain no added ingredients. In addition, nutrition information on such products is available to consumers through other means such as the Extension Service, grocery stores, and trade associations.

In the ANPR, FSIS requested comments on whether it should incorporate point-of-purchase materials in its voluntary program. Commenters supported incorporating point-of-purchase materials. Therefore, FSIS is proposing to include point-of-purchase materials in the evaluation of significant participation in the voluntary program. Examples of the use of point-of-purchase materials to display nutrition information may include large placards (e.g., wall posters, signs, aisle hangings), pamphlets, brochures, and notebooks. The nutrition information may be supplemented by videos, live demonstrations or other media. For point-of-purchase materials, FSIS urges retailers to provide nutrition information in accordance with the mandatory requirements in this proposal. FSIS believes that point-of-purchase materials offer an acceptable method of presenting nutrition information to consumers.

The NLEA requires FDA to issue a report by May 8, 1993, on actions taken to comply with its voluntary guidelines. If FDA finds substantial compliance, FDA will reevaluate for substantial compliance every 2 years from the issuance of its May 1993 report; i.e., May 1995, May 1997, and so forth. If substantial compliance is not found during its initial evaluation or subsequent reevaluations, the NLEA requires FDA to mandate nutrition labeling for those products under the voluntary program.

FSIS proposes to survey food retailers on actions taken to provide consumers with nutrition information on products described in the voluntary program. As required by the NLEA, FDA will implement (1) the voluntary part of its nutrition labeling program in November of 1991 and (2) the mandatory part of its nutrition labeling program in May 1993. FSIS proposes to implement both the voluntary and mandatory nutrition labeling programs in May 1993. Should the regulation be finalized as proposed, FSIS would not begin surveying for significant participation in its voluntary program until after May 1993. FSIS would be surveying for "significant participation" rather than follow FDA's review for "substantial compliance". FSIS does not have a statutory mandate, as provided to FDA under the NLEA, to review for "substantial compliance" of the voluntary guidelines. Because of the lack of such a mandate, FSIS is proposing different terminology to refer to its review of the voluntary program.

However, FSIS proposes to follow FDA's planned 2-year evaluation cycle of the voluntary program. Thus, FSIS would issue its first report of survey findings on the voluntary program by May 1995. FSIS would reevaluate for significant participation every 2 years thereafter. If FSIS determines, during any evaluation of its voluntary guidelines, that significant participation does not exist, FSIS would initiate proposed rulemaking to determine whether it would be beneficial to require nutrition labeling on single-ingredient, raw meat and poultry products. The guidelines would remain in effect, however, as long as significant participation exists.

FSIS is proposing that individual stores that are selected for evaluation of the guidelines will be found to be participating at a significant level if (1) the store provides nutrition labeling information for at least 90 percent of the major cuts of single-ingredient, raw meat and poultry products, including those that have been previously frozen, listed in Table I, that it sells; and (2) nutrition labeling information is in accordance with the guidelines described in the regulations.

FSIS proposes to use a representative sample of stores to obtain the information necessary to assess participation. The distribution of the sample of stores would cover all chain companies and a representative sample of independent companies. FSIS further proposes that significant participation by food retailers exists if at least 60 percent of the companies that are evaluated are participating in accordance with the guidelines. The 60 percent cut-off value for measuring participation is consistent with FDA. The FDA proposal published July 2, 1991, sets forth its rationale for determining that substantial compliance would occur when at least 60 percent of the companies evaluated provide nutrition information for at least 90 percent of the major products identified as participating in the study.

FSIS has identified major cuts of meat and poultry, as listed in Table 1 below. These 45 major cuts would be used to measure significant participation of the voluntary program. Identification of these cuts is based on USDA nutritional studies, Poultry Nutri-Facts and Meat Nutri-Facts programs.[4] FSIS believes these cuts are representative of the market and that industry can provide data for these products. FSIS requests comments on these popular cuts and any suggestions on revising this list.

TABLE 1.—MAJOR CUTS OF MEAT AND POULTRY

1. Whole Chicken
2. Chicken Breast
3. Chicken Wing
4. Chicken Drumstick
5. Chicken Thigh
6. Whole Turkey
7. Turkey Breast
8. Turkey Wing
9. Turkey Drumstick
10. Turkey Thigh
11. Beef Chuck Blade Roast
12. Beef Loin Top Loin Steak
13. Beef Rib Roast Large End
14. Beef Round Eye Round Steak
15. Beef Round Top Round Steak
16. Beef Round Tip Roast
17. Beef Chuck Arm Pot Roast
18. Beef Loin Sirloin Steak
19. Beef Round Bottom Round Steak
20. Beef Brisket (Whole, Flat Half, or Point Half)
21. Beef Rib Steak Small End
22. Beef Loin Tenderloin Steak
23. Ground Beef Regular, w/o added seasoning
24. Ground Beef Extra Lean, w/o added seasoning
25. Pork Loin Chop
26. Pork Loin Country Style Ribs
27. Pork Loin Top Loin Chop Boneless
28. Pork Loin Rib Chop
29. Pork Spareribs
30. Pork Loin Tenderloin
31. Pork Loin Sirloin Roast
32. Pork Shoulder Blade Steak
33. Pork Loin Top Roast Boneless
34. Ground Pork
35. Lamb Shank
36. Lamb Shoulder Arm Chop
37. Lamb Shoulder Blade Chop
38. Lamb Rib Roast
39. Lamb Loin Chop
40. Lamb Leg (Whole, Sirloin Half, or Shank Half)
41. Veal Shoulder Arm Steak
42. Veal Shoulder Blade Steak
43. Veal Rib Roast
44. Veal Loin Chop
45. Veal Cutlets

[4] *Poultry Nutri-Facts* is prepared jointly by and available from the Food Marketing Institute, the National Broiler Council, and the National Turkey Federation. Meat Nutri-Facts is prepared jointly by and available from the Food Marketing Institute, the National Live Stock and Meat Board, and the American Meat Institute.

III. Nutrition Label Content

A. Background

The NLEA mandates that the amount of the following food constituents be included on the labeling of non-exempted food products: Calories derived from any source, calories derived from the total fat, total fat, saturated fat, cholesterol, total carbohydrates, complex carbohydrates, sugars, dietary fiber, protein, and sodium. Also required to be included is any mineral, vitamin, or other nutrient required to be placed on the label or labeling before October 1, 1990, if the Secretary of HHS determines that such information will assist consumers in maintaining healthy dietary practices. The NLEA allows FDA, by regulation, to add other nutrients to the list of nutrients that should be included on the labeling of foods subject to the NLEA, if this will help consumers to maintain healthy dietary practices. It allows FDA, by regulation, to remove nutrients required to be listed, if the Secretary of HHS determines that the information relating to the nutrient is not necessary to assist consumers in maintaining healthy dietary practices. The NLEA specifies that a simplified nutrition label format is to be used when a food contains insignificant amounts of more than one-half of the nutrients required to be listed.

During consideration of the NLEA, Congress had received testimony that certain saturated fatty acids, such as stearic acid, do not increase blood cholesterol and, thus, should not be counted as saturated fat on the nutrition label (H. Rep. No. 101–538, 101st Cong. 2nd Sess. 14). In the House Report on the NLEA, H. Rep. No. 101–538, 101st Cong, 2nd Sess. 14, Congress confirmed FDA's authority under the Act to provide definitions for nutrients, such as saturated fat, to be included on the label. Congress indicated that these definitions would give manufacturers a precise definition of the nutrients so that they would know the type of analysis to conduct on the food. Congress further stated that FDA "has the discretion to define saturated fat in a way that excludes specified fatty acids, such as stearic acid, if the Secretary determines that such an exclusion is consistent with the public health and is based on sound scientific principles" (H. Rep. No. 101–538, 101st Cong. 2nd Sess. 14).

In its July 19, 1990, proposal on mandatory nutrition labeling, FDA proposed to add calories from total fat, amounts of saturated fatty acid, cholesterol, and total dietary fiber, except if a serving (portion) contains less than a specified amount, to the list of nutrients it currently requires to be listed, and to remove the requirement that thiamin, riboflavin, and niacin be declared except in certain circumstances, because public health concerns for deficient intakes of these B vitamins has lessened considerably in the last 20 years. It proposed to permit voluntary disclosure of complex carbohydrates and sugars, unless a claim is made with respect to sugar, because dietary guidance recommendations for these food components are not quantified by consumption goals. FDA also recognized that there is a general consensus that the cholesterol-raising fatty acids are primarily lauric, myristic, and palmitic, and that current evidence indicates that stearic acid does not raise serum cholesterol. FDA requested comments as to which fatty acids should be classified as saturated.

NAS recommended optional disclosure of complex carbohydrates and sugars stating that "foods containing high proportions of complex carbohydrates are highly desirable for overall good health, not necessarily because of their specific contribution to chronic disease prevention but because these foods are usually low in fat and calories and are high in fiber." It argued that legitimate concerns about simple sugars center on dental caries, nutrient dilution, and excess calories, as opposed to their contribution to disease conditions. NAS also noted that many industry groups have raised questions

about whether current analytical methods are adequate to support mandatory disclosure of complex carbohydrates and sugars. Besides recommending compulsory disclosure of the other food constituents listed by name in the NLEA, NAS favored required disclosure of unsaturated fat, calcium, and iron. It proposed that listing of vitamins, including vitamins A and C, be allowed as an option. In regard to saturated fat, NAS noted that a substantial body of scientific evidence has confirmed that the serum cholesterol-raising fatty acids are primarily lauric, myristic, and palmitic acids and that, unlike these saturated fatty acids, stearic acid does not elevate serum cholesterol levels. However, it now is currently classified as saturated for purposes of nutrition labeling.

B. Discussion of Comments and Proposal

In the ANPR, FSIS anticipated it would adopt FDA's July 1990 proposed list of required nutrients, which includes calories, calories from total fat, total fat, saturated fat, cholesterol, total carbohydrate, dietary fiber, protein, sodium, vitamin A, vitamin C, calcium, and iron, and incorporate complex carbohydrate and sugars as required by the NLEA. Commenters were generally in support of this list of required nutrients; however, there was strong opposition to requiring complex carbohydrate and sugars on the label. Various food manufacturers and distributors and trade associations opposed to the mandatory listing of complex carbohydrates and sugars on the label. Opposition was also expressed by consultants, a consumer, a professional organization, an import/export manufacturer, a State government, a consumer advocate organization, and a foreign government. These commenters stated that in most of the FSIS-regulated products, complex carbohydrates and sugars are present in small amounts or not at all. The commenters expressed the view that inclusion of these components on the label would be of little use to the consumer. There was also strong opposition to requiring dietary fiber. Those against the mandatory listing of dietary fiber were food manufacturers and distributors, trade associations, and a consultant. Because meat and poultry products are not generally meaningful sources of dietary fiber, the commenters contend that disclosure would be of limited value to the consumer. While some meat and poultry products, such as whole muscle cuts, may contain little or no dietary fiber, breaded and meal-type products may contain substantial amounts of dietary fiber.

FSIS requested comments on the inclusion of stearic acid in the definition of saturated fat. Comments indicated greater support for excluding stearic acid than including it in the definition. Several commenters recommended that FSIS and FDA harmonize on whatever decision is made. FDA's proposal defines saturated fat as the sum of lauric, myristic, palmitic, and stearic acids. This definition is consistent with the current definition of saturated fat for the purposes of nutrition labeling. Retention of this definition would avoid confusion and analytical costs that would result if the definition were changed. FDA and USDA also recognized that there is a general consensus that cholesterol-raising fatty acids are primarily lauric, myristic, and palmitic, and that stearic acid does not raise serum cholesterol. FSIS, like FDA, requested comments as to which fatty acids should be classified as saturated.

In the ANPR, the FSIS tentative position was to require that, at a minimum, the label include calories, total fat, saturated fat, cholesterol, total carbohydrate, protein, and sodium when the abbreviated format is used. Commenters supported allowing an abbreviated format. However, there was not a general consensus on what core nutrients should be required.

FSIS is proposing to: (1) Establish a list of 15 required nutrients, definition of nutrients, increments for declaring values, methods of calculation, and definition of insignificant amounts; (2) require an abbreviated format when more than one-half of the required nutrients are present in insignificant amounts; and (3) require, at a minimum, the declaration of calories, total fat, total carbohydrate, protein, and sodium when the abbreviated format is used.

1. List of Required Nutrients and Components. FSIS proposes to adopt FDA's current proposed list of nutrients as mandatory or voluntary components of nutrition labeling, definition of nutrients, and increments for declaring nutrients, in the interest of harmonizing with FDA. A more extensive discussion of FDA's proposed list of nutrients can be found in the preamble of FDA's proposed rule "Food Labeling: Mandatory Status of Nutrition Labeling and Nutrient Content Revision" dated July 19, 1990, and the Supplementary to that proposal published elsewhere in this issue of the Federal Register (see docket 90N-0134 and 90N-0135, Section III, Content of Nutrition Labeling). Based on the Agency's review of FDA's analysis and the recommendations from "The Surgeon General Report on Nutrition and Health", issued in 1988,[5] the Agency is proposing the following rules for the listing of nutrients and food components.

a. Calories. FSIS proposes to require the declaration of the caloric content of a food, and to use the term "calories" rather than the more precise terms "kilocalories" or "energy." The use of the term calories is more readily understood by consumers. FSIS is proposing to allow, on a voluntary basis, declaration of the number of kilojoules (kJ) in addition to calories and to allow the use of the term "energy" parenthetically as a synonym for calories.

b. Calories from total fat, saturated and unsaturated fat, carbohydrate, and protein. FSIS is proposing to require that when the caloric contributions of the energy nutrients, fat, saturated fat, unsaturated fat, carbohydrate, and protein are declared, they be expressed as calories from the nutrient rather than as a percent of total calories.

(1) Calories from total fat. FSIS is proposing to require the declaration of calories contributed by total fat. The most common and consistent dietary recommendation for the general population is for calories from total fat to be reduced to less than or equal to 30 percent of calories. To enable consumers to follow this recommendation that applies to the total diet, FSIS is proposing that the number of calories from total fat be listed on the nutrition label.

(2) Calories from saturated and unsaturated fat. Information on the contribution from the content of saturated and unsaturated fat declared in the nutrition label may be of interest to consumers. Accordingly, FSIS is proposing to permit the voluntary declaration of the calories from saturated and unsaturated fat. The Agency will not allow declaration of calories from polyunsaturated and monounsaturated fat because the definition of these two types of fat is limited to the *cis* form, with the *trans* form being excluded, so that declaration of calories would underrepresent total caloric value and therefore could be misleading to consumers.

(3) Calories from total carbohydrate. FSIS is proposing to permit the voluntary declaration of calories from carbohydrate. FSIS believes that information about the caloric

[5] The referenced portion of this report is available for public review in the FSIS Hearing Clerk's Office. Copies of that portion are available, without charge, from the FSIS Hearing Clerk.

contribution of carbohydrate in foods can be useful to consumers trying to replace fat in their diet with carbohydrate and therefore should be permitted in nutrition labeling.

(4) Calories from complex carbohydrate and sugars. FSIS is proposing that calories from complex carbohydrate and sugars not be declared on the label. The Agency believes this information would be of no value to consumers because there is currently no general consensus statements from the medical and scientific community concerning the caloric contributions of these components of total carbohydrates.

(5) Calories from protein. Because information on calories from protein may be useful to consumers in planning dietary changes, FSIS is proposing to permit voluntary declaration of calories from protein.

c. Amount of total fat, fatty acids, and cholesterol—(1) Amount of total fat. FSIS proposes to require the declaration of total fat in grams, to the nearest half gram. High dietary intakes of total fat are associated with an increased risk of atherosclerotic cardiovascular disease. High fat intake may also be associated with an increased risk of some types of cancer, gall bladder disease, and obesity.

(2) Amount of saturated fat. FSIS proposes to require the declaration of saturated fat in grams, to the nearest half gram. As previously discussed, FSIS proposes to adopt FDA's definition of saturated fat as the sum of lauric, myristic, palmitic, and stearic acids.

(3) Amount of unsaturated fat. Information on levels of unsaturated fat in a food could assist consumers in monitoring their intakes of various types of fat throughout the day. FSIS is proposing to permit the voluntary declaration of the amount of unsaturated fat in grams, to the nearest half gram. FSIS is proposing to make declaration of unsaturated fat mandatory if claims are made on the label about fatty acid or cholesterol content, or if the manufacturer chooses to declare calories from unsaturated fat.

FSIS is also proposing the use of the collective term "unsaturated fat" to present content information for the two types of unsaturated fat, polyunsaturated and monounsaturated fat, instead of requiring separate declarations of each of these two types of unsaturated fat. The use of this collective term will simplify the presentation of information and allow manufacturers to conserve space. Because the definition of unsaturated fat will include all unsaturated fatty acid isomers (i.e., *cis* and *trans* isomers) rather than specific isomers of the unsaturated fatty acids, it provides an appropriate basis for voluntary declaration of calories from unsaturated fat.

(4) Amounts of polyunsaturated and monounsaturated fat. As an alternative to using the collective term "unsaturated fat", FSIS is proposing to permit the voluntary declaration of the amounts of polyunsaturated or monounsaturated fat, in grams to the nearest half gram. However, if label claims are made about polyunsaturated or monounsaturated fat, amounts of these fatty acids would be required to be listed. If a manufacturer chooses to list polyunsaturated or monounsaturated fat, or if the declaration is required because of a label claim, under this proposal, both polyunsaturated and monounsaturated fat will have to be declared so that complete information will be provided.

When polyunsaturated and monounsaturated fat are declared, FSIS is proposing to limit these fatty acids to *cis*, *cis*-methylene-interrupted polyunsaturated fatty acids and *cis*-monounsaturated fatty acids. The Agency is proposing to exclude the *trans* isomers. Thus, the definition for polyunsaturated and monounsaturated fat is less inclusive than the definition of unsaturated fat which includes both *cis* and *trans* isomers.

(5) Amount of *trans* isomers of fatty acids. FDA received comments suggesting that *trans* isomers of fatty acids behave similarly in the diet to saturated fat in that they are associated with increased serum cholesterol levels, and therefore FDA should require that levels of *trans* fatty acids be declared as a separate entity on the nutrition label. However, FDA tentatively concluded that there was no basis for declaring *trans* isomers. In its supplemental to its proposal entitled "Food Labeling; Mandatory Status of Nutrition Labeling and Content Revision" (July 19, 1990), FDA acknowledged that new research and commentary had been published concerning the effect of *trans* isomers of fatty acids on serum cholesterol levels. FDA is requesting comments on the significance of the new findings. Therefore, FSIS will address the issue of *trans* isomers of fatty acids once FDA has made a determination in this area.

(6) Amount of cholesterol. FSIS is proposing to require the declaration of cholesterol and that it be declared in milligrams. Given the scientific consensus on the benefits of reducing dietary cholesterol as well as the availability of quantitative intake recommendations, the Agency concludes that mandatory declaration of cholesterol content of foods is warranted.

d. Amount of total carbohydrate, complex carbohydrate, dietary fiber, sugars, and sugar alcohols—(1) Amount of total carbohydrate. FSIS is proposing to require the declaration of total carbohydrate and that it be declared in grams. FSIS is proposing to define total carbohydrate to exclude dietary fiber. Because dietary fiber includes components of carbohydrate that cannot be digested by humans, the proposed definition of total carbohydrate does not include the components of carbohydrate that generally do not contribute calories to the diet. Thus, the proposed definition encompasses only the metabolizable energy of carbohydrate.

(2) Amount of complex carbohydrate. FSIS is proposing to require the declaration of complex carbohydrate and that it be declared in grams in the interest of harmonizing with FDA. FSIS proposes that complex carbohydrate be defined as the sum of dextrins and starches. Thus, complex carbohydrate, as defined, includes those carbohydrate components that contain 10 or more saccharide units (exclusive of dietary fiber). The Agency recognizes that many consumers are interested in these components but it also believes required nutrients should be those with demonstrated health implications and those that can be accurately determined.

(3) Amounts of sugars and sugar alcohols. FSIS is proposing to require the declaration of sugars content and continues to seek comments on this issue in the interest of harmonization with FDA. FSIS proposes to define sugars as the sum of all free mono- and oligosaccharides (and their derivatives) that contain four or fewer saccharide units. This definition includes tri- and tetrasaccharides. Considering that sugar alcohols behave metabolically like sugars and are used as nutritive sweeteners in foods, FSIS is proposing to include sugar alcohols in the definition of "sugars" for labeling purposes. Although sugar alcohols are included in the definition of sugars, FSIS is proposing to allow, on a voluntary basis, separate declaration of sugar alcohols. Under the proposal, declaration would become mandatory if claims are made relative to sugar alcohols or to sugar when sugar alcohols are present.

(4) Amount of dietary fiber. FSIS is proposing to require the declaration of total dietary fiber content in the interest of harmonization with FDA. Different physiological effects are associated with soluble and insoluble dietary fibers, and consumers have expressed interest in

knowing the amounts of these types of fiber in foods. However, no quantitative guidelines for daily intakes of soluble and insoluble fiber components have been provided. Thus, FSIS is proposing to permit the voluntary declaration of insoluble and soluble fiber components, unless a claim for either fiber content is made, in which case declaration would be required. If one fiber component is declared, FSIS is proposing that for completeness, both must be declared.

e. Protein. (1) Quantitative protein content. FSIS proposes to require the declaration of protein content as the number of grams of protein per serving. In addition, the Agency is proposing to require that the label for any food contain the statement "not a significant source of protein" immediately adjacent to the protein content regardless of the actual amount of protein present if the food (1) intended for adults and children 4 or more years of age, has a protein quality value that is a protein digestibility-corrected amino acid score of less than 20 percent of casein, (2) intended for children greater than 1 but less than 4 years of age, has a protein quality value that is a protein digestibility-corrected amino acid score of less than 40 percent of casein, or (3) intended for infants, has a protein quality, as measured by protein efficiency ratio, of less than 40 percent of casein.

(2) Protein content as a percentage of the Reference Daily Intakes (RDI). FSIS is proposing that declaration of protein content calculated as a percent of the RDI be voluntary for foods intended for consumption by adults and children 4 or more years of age unless a protein claim is made for the food. However, the Agency is also proposing that nutrition labeling on foods intended for infants and children less than 4 years of age contain a mandatory statement of protein content expressed as a percent of the RDI. The Agency considers this action to be warranted because of the importance of the quality of protein in diets derived from a limited number of foods, as is the case for infants and young children.

When the percent RDI for protein is declared, FSIS is proposing that this information be placed adjacent to the declaration of the quantitative amount of protein and expressed as "Percent of Daily Value." Use of the terminology "Percent of Daily Value" is discussed below under "Amounts of vitamins and minerals."

f. Amount of sodium. The Agency is proposing to require the declaration of sodium content in milligrams. FSIS believes it is prudent to recommend caution concerning sodium intake for the general population.

g. Amount of potassium. FSIS is proposing to permit the voluntary declaration of the amount of potassium in milligrams.

h. Amounts of vitamins and minerals. FSIS is proposing to require that vitamin A, vitamin C, calcium, and iron be declared in the nutrition label and that they be declared as a percent of the RDI. This proposal is based on the continuing public health concerns relative to inadequate dietary intakes of these nutrients by specific portions of the population, as well as possible association between several of these nutrients and risk of chronic disease. FSIS is also proposing to require the presentation of this information as a percentage of the reference standard (i.e., RDI) rather than as a quantitative amount, such as grams or milligrams. FSIS is proposing to use the terminology, "Percent of Daily Value," to head the list of vitamins and minerals.

FSIS believes it is beneficial to have a general term such as "Daily Value" that can apply to both types of reference standards, RDI's and Daily Reference Values (DRV's), so that consumers are not confused by the list of two different sets of values. While amounts of vitamins and minerals are to be expressed as a percent of the RDI, the Agency believes that declaration on food labels does not require exact specificity.

(1) Vitamin A. FSIS is proposing to require the declaration of vitamin A. Information about the vitamin A content of foods is important to consumers because the limited number of foods rich in vitamin A requires selective choices by consumers.

(2) Vitamin C. FSIS is proposing to require the declaration of vitamin C based on its well established role in non-heme iron absorption.

(3) Calcium. FSIS is proposing to require the declaration of the calcium content of foods. The Agency is proposing to do so based on (1) the limited number of calcium-rich foods in the U.S. food supply, (2) current concerns that calcium intakes are generally marginal, and (3) evidence that adequate calcium intakes are needed to allow for optimal bone mass development during childhood and young adulthood which in turn may reduce the risk for osteoporosis.

(4) Iron. Iron deficiency remains a risk for certain segments of the U.S. population, notable among young children, adolescents, and women of childbearing age. Pregnant women, especially those with low incomes, are also a group at risk. Therefore, FSIS is proposing to require the mandatory declaration of the iron content of foods.

(5) Thiamin, riboflavin, and niacin. FSIS is proposing to make the declaration of thiamin, riboflavin, and niacin voluntary.

(6) Other vitamins and minerals. FSIS is also proposing that declarations concerning the content of the remaining vitamins and minerals for which RDI's have been proposed may continue to be listed in nutrition labeling on a voluntary basis, unless claims are made about them. The complete list of vitamins and minerals for which RDI's have been proposed can be found in FDA's proposed rule "Food Labeling: Reference Daily Intakes and Daily Reference Values" (July 19, 1990, 55 FR 29485).

(7) Synonyms. The terms "folacin" and "folate" are currently used interchangeably, and the term "ascorbic acid" is the commonly used chemical name for vitamin C. Therefore, the Agency is proposing to permit the use of the term "ascorbic acid" parenthetically as a synonym for vitamin C and the term "folacin" parenthetically for "folate."

2. *Abbreviated format.* The use of an abbreviated format helps to keep space requirements to a minimum. The NLEA requires the use of an abbreviated format if a food contains insignificant amounts of more than one-half of the required nutrients. FDA considered all 15 nutrients in its supplementary proposal as "required nutrients". The 15 nutrients to be included are: Calories, calories from total fat, total fat, saturated fat, cholesterol, total carbohydrate, complex carbohydrate, sugars, dietary fiber, protein, sodium, vitamin A, vitamin C, calcium, and iron.

FSIS recognizes that many meat and poultry products will likely contain more than one-half of the required nutrients. However, in the interest of nutrition labeling harmonization, FSIS believes it should apply FDA's threshold criteria for an abbreviated format for meat and poultry products. Therefore, FSIS is proposing that if a meat and poultry product contains eight or more required nutrients in insignificant amounts, it is subject to an abbreviated format.

a. Minimum nutrients declared on label. In the ANPR, FSIS's tentative position was to require that the label include, at a minimum, calories, total fat, saturated fat, cholesterol, total carbohydrate, protein and sodium. Although the commenters supported allowing an abbreviated format, there was no consensus on what core nutrients should be required. The current abbreviated format includes the

number of calories, protein, carbohydrates, and fat and or sodium. Consumers are familiar with this format and are interested in the continued listing of these nutrients. FSIS is proposing to require that, at a minimum, calories, total fat, total carbohydrate, protein, and sodium be declared, in the interest of harmonizing with FDA's proposed core nutrients. In addition, FSIS is proposing that all nutrients or food components that are required components of the full nutrition label be declared if less than one-half of them are present in insignificant amounts. As long as no additional nutrients (e.g., potassium) are declared, the nutrients or food components (other than the core requirements) that are required parts of the full nutrition label but that are present in insignificant amounts would not be identified on the simplified label. However, if manufacturers voluntarily choose to declare additional nutrients or food components that are not among the 15 required nutrients (e.g., potassium), they will then be required to use the statement "Not a significant source of ," with the blank filled in with the name of any required nutrients or food components that are missing or present in insignificant amounts.

b. Products voluntarily enriched or fortified. The Agency is also proposing that if the product is voluntarily enriched or fortified with added vitamins or minerals, any such nutrients must be declared within the abbreviated format and followed by the above statement. However, as an exception, standardized enriched foods that qualify for the use of the abbreviated format may use this format without the added statement, even though they include nutrients that are required by the standard to be added but are not among the 15 required nutrients.

c. Definition of "insignificant amount". FSIS is proposing to define "insignificant amount" as that amount which may be rounded to zero in nutrition labeling. For consistency, FSIS is proposing to use the same definition as FDA for insignificant amounts as described below. Very low levels of nutrients or food components may be rounded to zero, the Agency is proposing to indicate precisely what analytical amounts may be rounded down to zero: Calories; calories from total fat; calories from saturated fat, unsaturated fat, total carbohydrate, and protein; total fat; saturated fat; unsaturated fat; polyunsaturated fat; monounsaturated fat; total carbohydrate; complex carbohydrate; sugars; sugar alcohols; dietary fiber; soluble fiber; insoluble fiber; and protein. In the case of calories, which are proposed to be declared to the nearest 5-calorie increment in nutrition labeling (up to 50 calories), the amount specified that would be expressed as zero is "less than 5 calories." For total fat, total carbohydrate, sugars, sugar alcohols, dietary fiber, soluble fiber, insoluble fiber, and protein, FSIS is proposing less than 0.5 grams as the amount that can be expressed as zero. For saturated fat, unsaturated fat, polyunsaturated fat, and monounsaturated fat, FSIS is proposing less than 0.25 grams as the amount that can be expressed as zero. For sodium, FSIS is proposing that sodium content may be expressed as zero when less than 5 mg are present per serving (portion). For cholesterol, FSIS is proposing that a zero declaration be allowed when the cholesterol content of a food is less than 2 mg per serving (portion). FSIS is proposing that for vitamins and minerals, a value of less than 2 percent of the RDI be considered insignificant.

3. Packages with variable contents. In its July 19, 1990, proposal on mandatory nutrition labeling (55 FR 29505), FDA proposed that where assortments of food are packaged, firms would be required to express nutrient content based on the package as a whole (e.g., the entire product contents may be combined for a nutrient analysis). However, many meat and poultry manufacturers currently provide nutrition information in their "variety packs" (e.g., a package containing sliced ham, bologna, and pickle loaf) on the individual foods. In order to provide greater flexibility, FSIS is proposing to allow packages with variable contents to declare the nutrient content on the entire package contents or on each individual food.

IV. U.S. Recommended Daily Allowances

A. Background

FSIS proposes to follow current FDA requirements, set forth in 21 CFR 101.9, concerning use of the U.S. Recommended Daily Allowances (U.S. RDA's) in nutrition labeling. FDA established this single set of values in 1973 for regulatory use in declaring contents of vitamins and minerals (38 FR 2125).

On July 19, 1990, FDA published a proposed rule on Reference Daily Intakes (RDI's) and Daily Reference Values (DRV's) (55 FR 29476). The proposal discusses various issues such as the need for change in reference values for nutrition labeling, development of the RDI, DRV values, and the units of measures.

FDA proposed to update and expand the current U.S. RDA's with RDI's to provide a basis for consumers to compare the protein, vitamin, and mineral contents of foods. FDA proposed to establish RDI's for protein and 26 vitamins and minerals, and to focus on five specific consumer groups: Adults and children 4 or more years of age, children less than 4 years of age (13 through 47 months), infants, pregnant women, and lactating women. FDA noted that its proposal to revise the U.S. RDA's was based primarily on the 1989 Recommended Dietary Allowances and Estimated Safe and Adequate Daily Dietary Intakes (ESADDI's) of the National Research Council of NAS (except for chloride) (55 FR 29478).

In addition, FDA proposed DRV's for adults and children 4 or more years of age for eight other food components including total fat, saturated fatty acids, unsaturated fatty acids, cholesterol, carbohydrate, fiber, sodium, and potassium for which RDA's and ESADDI's have not been established but that are important in diet and health interrelationships (55 FR 29478). The RDI's and DRV's are meant to serve as reference values for labeling purposes only, as opposed to dietary intake recommendations. They are intended to help consumers compare how nutrient levels in various foods contribute toward general recommendations for a total diet and to facilitate graphical presentations of nutrient information.

In an effort to clarify the manner of declaring amounts of DRV's, FDA published a proposed supplemental rule in this issue of the Federal Register (see dockets 90N-0134 and 90N-0135, Section VI, Other Nutrition Labeling Provisions). This proposal would require that, when a nutrition profile is given, the percent DRV's be expressed in 2-percent increments up to and including the 10-percent level, 5-percent increments above 10 percent and up to and including the 50-percent level, and 10-percent increments above the 50-percent level.

It is necessary to differentiate between RDI's and DRV's for regulatory purposes. The term "daily value" will be used for food labeling. The term distinguishes the reference value as a daily intake level and will enable the consumer to understand the relative significance of the information presented in the context of a total daily diet.

B. Discussion of Comments and Proposal

In its April 2, 1991, ANPR, FSIS requested comments on its tentative

position to adopt FDA's reference values. The majority of the commenters concurred that FSIS should adopt the values being proposed by FDA to provide consumers with a basis to compare the protein, vitamin, and mineral content of all foods.

Some concerns were expressed that FDA's RDI values had not been completed. A few others wrote that a consumer education program was not in place. After giving all comments careful consideration, it remains the interest of FSIS to be consistent with past practice, and, in the interest of nutrition label harmonization, to adopt FDA's RDI values.

The majority of the comments received on the DRV's agree that FSIS should adopt the values being proposed by FDA to provide a basis for consumers to compare nutrients and food components (fat, fatty acids, cholesterol, carbohydrate, fiber, sodium, and potassium) that have been identified as important to diet and health interrelationships.

FSIS is proposing to parallel FDA by requiring that DRV's become a part of nutrition labeling. FSIS also proposes to adopt FDA's proposed format for the "daily value", as presented in the proposed 21 CFR 101.9(c)(12)(i).

V. Serving Sizes

A. Background

The definition of a product's serving size is an essential element of a uniform nutrition labeling system. A product's serving size is used as the basis for reporting that product's nutrient values and serves as the reference point for using descriptors. FSIS is aware of public concern that the serving sizes on many products are misleading. In many cases, serving sizes currently in use are neither reasonably consumed amounts of a product nor are they consistent for similar food products. This makes it very difficult to compare products and to select the one that fits an individual consumer's needs. FDA regulations stipulate that a "serving" is a reasonable quantity of food suited for consumption as part of a meal, and "portion" as the amount of food customarily used only as an ingredient in the preparation of other foods (21 CFR 101.9(b)(1)). FSIS permits nutrient values to be listed per serving with the size of the serving expressed in common household measures. Alternatively, FSIS allows use of portion sizes for foods that are not used only as ingredients in the preparation of other foods, but also for foods in which the manufacturer's serving size is less than that commonly accepted for a serving of the particular food. Industry generally determines the serving or portion sizes stated for their products. FSIS exercises control over the use of the terms "serving" versus "portion" during the prior label approval process. FSIS's "Standards and Labeling Policy Book" currently defines a "dinner" as a product with a minimum serving size of 10 ounces, a minimum of three components, and a minimum meat or poultry content requirement depending on the product name.[6]

To make nutrition information on food labels meaningful, the NLEA requires FDA to establish standards to ensure that nutrition labeling provide the serving size which is an amount customarily consumed and is expressed in a common household measure appropriate to the food. NAS recommended that FDA and USDA jointly establish sizes for limited, broad categories of foods to help consumers make product comparisons. NAS suggested basing them on standard serving sizes as specified by dietary guidance recommendations to make their use in educational programs less difficult and to permit consistency among serving sizes shown in dietary guidance material and on the food label. NAS also advocated a petition process for desired deviations from the serving size set by FDA and USDA or for creation of different food subcategories with other serving sizes.

B. Discussion of Comments and Proposal

In order to establish standards for nutrition labeling of meat and poultry products which are in harmony with the NLEA and with regulations and guidelines being established by the FDA to administer the Act, and in response to comments on the ANPR issued on April 2, 1991, the FSIS is proposing to: (1) Create Reference Amounts for serving sizes for 23 food Product Categories; (2) establish guidelines for converting Reference Amounts to serving sizes; (3) define serving sizes for meal-type products and food products in pieces or units; (4) require presentation of nutrition information based on serving size "as packaged" for the mandatory labeling program and allow nutrition information for single-ingredient, raw meat and poultry to be declared "as packaged" or "as consumed" under a voluntary nutrition labeling program; (5) require the use of both common household and metric measures to declare serving size; (6) define serving size and single-serving container; (7) establish guidelines for declaring the number of servings per container; (8) require the use of serving size and Reference Amounts to evaluate nutrition claims; and (9) allow for petitions for changes in Product Categories and Reference Amounts.

In the ANPR issued by FSIS on April 2, 1991, four major areas of concern related to serving sizes were discussed and tentative positions were presented. These areas addressed (1) standardized size unit for presenting nutrition information, (2) serving sizes for meal-type products and food products in pieces or units, (3) product state for presenting nutrition information, e.g., "as packaged" or "as consumed," and (4) unit of measure most readily understandable to the public.

On April 4, 1991, FSIS participated in a public meeting conducted by FDA to discuss issues on serving sizes. This open meeting provided an additional opportunity for interested parties to submit both oral and written comments. A copy of the transcript of the meeting is on file with the FSIS Hearing Clerk, Room 3171, South Building, USDA, Washington, DC 20250. Oral presentations were made at the public meeting on serving sizes by representatives of food industries and trade organizations, professional nutrition organizations, and consumer organizations.

1. *Reference Amounts for serving sizes for 23 food Product Categories.* In the ANPR, FSIS discussed three options for establishing standardized reference serving sizes: (1) 1 ounce or 100 grams, (2) a single, uniform Reference Standard serving size using food consumption data, and (3) a Reference Standard serving size based on dietary recommendations.

Option 1 would establish a single, uniform standard size unit such as 1 ounce or 100 grams. Fresh meat and poultry products and some processed products are packaged in an infinite variety of sizes, and are packaged and then weighed, rather than weighed and then packaged. It is difficult for such products to have an integral number of standardized servings.

A 1-ounce serving size would provide the easiest method for conversion to multiples, and allow consumers to make comparisons between meat and poultry products easily and readily. A possible problem with this option is that consumers may not realize that the information has to be converted to be meaningful in terms of the amounts they eat.

[6] The referenced portion of the "Standards and Labeling Policy Book" is available for public review in the FSIS Hearing Clerk's Office. Copies of that portion may be obtained, without charge, from the FSIS Hearing Clerk.

There was some support for a uniform standardized size unit of 1 ounce because it is easily multiplied and can be used for most meat and poultry products. Those opposed expressed concern that the consumer may not easily be able to make the conversions to larger serving sizes and that one ounce is not a "commonly consumed amount" for meat and poultry products.

Some commenters preferred presenting nutrition information per 100 grams, but also preferred that metric units be required either in addition to or instead of the U.S. measure of the ounce. They cited international harmonization, trade concerns, and the need to respond to requirements of the Omnibus Trade and Competitiveness Act which requires use of the metric system in doing business by 1992.

Option 2 considered establishing a standard serving size for meat and poultry products using food consumption data. This would be more consistent with FDA's July 19, 1990, proposal and the NLEA. FDA proposed to establish standard serving sizes for 159 categories of foods, whereas FSIS would establish a single one standard serving size for the general category of meat and poultry products. FDA considered establishing 159 food product category serving sizes because they regulate a wide diversity of food and food products (55 FR 29530).

There was virtually no support for establishing a single uniform serving size based on food consumption data. FSIS decided not to adopt this approach because of lack of support from commenters. There was, however, support for using food consumption data as the basis for establishing serving size categories similar to those proposed by FDA in the July 19, 1990, proposal.

Option 3 would establish a standard serving size for meat and poultry products using dietary recommendations. This would provide nutrition information on the recommended portions of foods. However, it would not provide information on what is actually being consumed.

There was limited support from nutrition educators and health professionals to provide nutrition information using dietary recommendations. Although the advantages presented by the supporters of this concept have merit for nutrition education purposes, FSIS believes the problems with this approach outweigh the advantages. FSIS has the following concerns: (1) The NLEA defines serving size as an "amount customarily consumed"; that is, the Act links serving size to the amount consumed and not to an amount recommended by the dietary guidance recommendations or any other system; (2) many serving sizes in dietary guidance recommendations are for very narrow food categories, e.g., the recommendation is for lean cooked meat, whereas many meat products such as beef patties may contain ingredients other than meat; and (3) there are no dietary guidance recommendations for many product categories, particularly further processed packaged products for which nutrition labeling is mandatory (e.g., frozen entrees and dinners; snack foods; infant and toddler foods).

There was no strong support for any of the three options proposed. The comments in favor of any of the three options proposed for establishing serving sizes were split approximately evenly. However, virtually all comments supported harmonization with FDA. Comments stated that harmonization with FDA should be an overriding factor when resolving issues between the two agencies. The vast majority of comments echoed the contention that without a single, uniform set of nutrition labeling regulations for all foods, confusion will continue to exist. In addition, the NAS report recommended that USDA and FDA jointly establish serving sizes for a limited number of different food categories to allow ready product comparison.

In an effort to harmonize the serving sizes for all foods, FDA established the Interagency Committee on Serving Sizes. The committee consisted of representatives from FDA and USDA's Food Safety and Inspection Service and Human Nutrition Information Service. FSIS and FDA will continue to cooperate throughout the rulemaking process to assure the best possible uniform food labeling system.

The committee's major goal was to establish standards that could be used by manufacturers to determine: (1) Label serving sizes in household measures most appropriate to their specific products, and (2) whether a claim such as "low sodium" meets criteria for the claim.

Using the principles set forth in the preamble of FDA's proposed rule on serving sizes (see docket 90N–0165, published elsewhere in this issue of the **Federal Register**), the Interagency Committee established 131 Product Categories and Reference Amounts for each category. These 131 Product Categories were representative of all food products regulated by both USDA and FDA. A detailed discussion of the Interagency Committee's work and the principles, methodology, and procedures used to develop the Reference Amounts is contained in the preamble of FDA's reproposal on serving sizes (see docket 90N–0165, Section IV, The Proposed Regulation, D. Proposed Reference Amounts for Serving Sizes, Sections 2 and 3).

Of the 131 Product Categories and Reference Amounts set up by the committee, 23 apply to meat products and 22 apply to poultry products which are regulated by USDA. Therefore, FSIS is proposing to establish 23 Product Categories and Reference Amounts for meat products and 22 Product Categories and Reference Amounts for poultry products which will provide a uniform food labeling system for the consumer so that similar foods such as vegetarian vegetable soup and beef vegetable soup will have the same reference standard. A discussion of the formation of the Product Categories and Reference Amounts and the guidelines for converting Reference Amounts to serving sizes follows.

FSIS is also proposing, along with FDA, that petitions may be submitted to amend the Reference Amounts and the Product Categories through the rulemaking process. Any such petitions for changes to the Reference Amounts and Product Categories for meat and poultry products would be submitted to the Administrator, FSIS. FSIS solicits public comments on the proposed Reference Amounts and any product or Product Category that should be added to the Reference Amounts, with supporting documentation. FSIS is also requesting comments on additional product examples that should be listed in the proposed Product Categories. Examples listed under Product Category are not all inclusive, and are provided to assist manufacturers in identifying the appropriate Reference Amount to use for their products.

2. *Procedures for converting Reference Amounts to Serving Sizes.* Procedures are needed by manufacturers so they can convert the Reference Amounts to serving sizes in common household measures that are most appropriate for their products. FDA is proposing guidelines for converting Reference Amounts to serving sizes for (1) products in discrete individual units, e.g., hot dogs and slices of meat; (2) products in large discrete units that are usually divided for consumption, e.g., pizza (when not marketed as a serving for one); and (3) non-discrete bulk products, e.g., beef stew and meat chili (see docket 90N–0165, Section IV, E. Procedures for Converting the Reference Amount to Serving Size, published elsewhere in this issue of the **Federal Register**).

These procedures would help to assure uniformity in the declared serving size within a Product Category and allow flexibility in the serving size to account for differing characteristics of diverse food products. As a member of the Interagency Committee, FSIS participated fully in establishing the criteria as published in the preamble of FDA's rationale. Therefore, FSIS is proposing to adopt the procedures as published in the proposed 21 CFR 101.9(b)(2).

3. *Serving Sizes for Meal-type Products and Food Products in Pieces or Units.* In the ANPR, FSIS discussed its plan to propose nutrition labeling for meal-type products, and for piece or unit products. A meal-type product is any product that is intended for consumption by one person. Under the ANPR, FSIS proposed that meal-type products would be labeled on the basis of the entire contents of the package, and pieces and units would be labeled based on each piece or unit.

There was strong support for nutrition labeling for meal-type products in their entirety. Several commenters suggested criteria for establishing serving sizes for meal-type products.

Because meal-type products are typically consumed by one person and make up the major portion of a meal, it is more meaningful to provide consumers with nutrition information on these products in terms of the entire product. A consumer would have nutrition information on exactly what he or she purchases and typically consumes. Therefore, the consumer would be able to evaluate how the product fits into his or her total diet. FSIS plans to propose nutrition labeling for meal-type products, based on the contents of the entire package. Comments supported nutrition information on products in discrete individual units (e.g., hot dogs). They contend that these products should be labeled per unit because that is how these foods are customarily eaten and the measure consumers most prefer for nutrition information on these products. Other products that belong in this category include sliced or individually shaped mini pizzas and individually wrapped or packaged products in multi-serving containers such as individually wrapped sausage, egg and biscuit breakfast buns packaged eight to a box.

A number of comments on bite-sized products suggested that the serving size should be the number that would make a "logical serving" or a "customarily consumed amount." One comment suggested a dual nutrition label format that would show both the amount customarily consumed as well as pieces or units. FSIS does not believe that dual listing would be useful to consumers. Rather, it believes that presenting the number of bite-size or very small pieces that make up a customarily consumed amount, as discussed further in this document, appears to be more useful to consumers for making product comparison.

FSIS believes that the common household unit most meaningful for products in discrete units would be the unit itself (e.g., piece). However, these products come in many different sizes. For example, the size of hot dogs ranges from .5 ounce cocktail franks to 4 ounce dinner franks. If nutrition information for these products is expressed on a single unit basis, there would be no uniformity in serving sizes declared on these products and consumers would have to compare, for example, the nutritional value of a .5 ounce cocktail frank with a 4 ounce dinner frank.

To assure uniformity in the serving size used for different sizes of similar products, FSIS is proposing that serving sizes for products in discrete units be the number of units most closely approximating the Reference Amount for the Product Category, which was established by the Interagency Committee. Provisions for converting Reference Amounts to serving sizes are set forth in FDA's proposed 21 CFR 101.9(b)(2) (see docket 90N–0165 published elsewhere in this issue of the Federal Register).

4. *Nutrition Information Based on Serving Size "as packaged" or "as consumed."* FSIS's tentative position in the ANPR was to require nutrition labeling on products "as consumed." The Agency recognized that preparation and cooking methods can significantly alter the nutrient composition of a food and that it might be necessary to provide nutrition information on foods as cooked using recommended methods without the use of salt, flour, cooking oil, or other such added ingredients.

Many comments addressed the issue of presenting nutrition information "as consumed" or "as packaged." There were slightly more comments favoring nutrition information being presented on products "as packaged."

Comments that advocated providing nutrition information on the "as consumed" basis stated that meat and poultry products are rarely eaten raw. Nutritional information based on the raw product, therefore, would be of little advantage to consumers. Some commenters felt the nutritional information should be educational and relevant to the diet as consumed, therefore supporting that "as consumed" labeling information would be most useful to consumers.

Those urging FSIS to require nutrition labeling on foods "as packaged" rather than "as consumed" thought the accounting for nutrient content changes which occur during the cooking process would be impossible. Factors such as time, temperature, humidity, altitude, microwave wattages, and cooking surfaces influence nutrient content changes during cooking. Some commenters stated that the chemical analysis requirements for these products would require substantial investment as well.

FSIS, consistent with FDA's mandatory and voluntary nutrition labeling scheme, is proposing to require nutrient values "as packaged" for products, except that products under the voluntary program may list nutrient values on an "as consumed" basis rather than an "as purchased" basis. Products covered by the mandatory program, required to list the "as purchased" nutrient values, have the option of also presenting "as consumed" values. The preparation method upon which the "as consumed" values are determined must be clearly indicated on the package.

5. *Units of Measure for Declaring the Serving Size.* In the ANPR, FSIS discussed the importance of establishing a standard unit of measure that would be readily understandable by consumers. FSIS's tentative position was that the use of weight as expressed in ounce(s) for meat and poultry products would be useful to consumers. In fact, the common household unit of measure for most meat and poultry products is ounces. FSIS believes that the use of the ounce as the unit measure on the nutrition label will be meaningful to consumers. However, in the interest of promoting free trade and international harmonization of nutrition labeling, FSIS's tentative position was that the use of grams should be optional.

The majority of the commenters agreed with the Agency's tentative position that the use of the ounce as the unit measure in nutrition labeling will be meaningful to consumers and that grams should be optional. However, there were a significant number of comments pointing out the importance of promoting free trade and international harmonization of nutrition labeling. Several comments cited the Omnibus Trade and Competitiveness Act of 1988 which requires use of the metric system in doing business after 1992.

To provide a uniform labeling system, FSIS is proposing to require the use of common household and metric measures

to declare serving sizes. In addition, FSIS will adopt FDA definitions and rules for declaring household measures. FDA is proposing that, whenever possible, cups, tablespoons or teaspoons should be used. Cups should be expressed in ¼ cup increments, tablespoons in whole number of tablespoons for quantities less than ¼ cup but greater than or equal to 1 tablespoon, teaspoons in whole number of teaspoons for quantities less than 1 tablespoon but greater than or equal to 1 teaspoon, and in ¼ teaspoon increments for quantities less than one teaspoon.

If cups, tablespoons or teaspoons are not applicable, units such as piece, slice, tray, jar, and fraction of the whole piece or package should be used.

If neither of the above is applicable, ounces may be used. Ounce measurements should be expressed in 0.5 ounce increments most closely approximating the Reference Amount.

FSIS is also proposing to allow an additional column of figures to be declared on the nutrition label based on 100 grams or 100 milliliters of the food as packaged or purchased. For products that are in units or pieces, the label may optionally declare the number of units or pieces in the serving size.

6. *Definition of Serving Size and Single-Serving Container.* FSIS is proposing to define a serving or serving size in the same manner as FDA (docket 90N–0165, section IV). A serving or serving size will mean an amount of food customarily consumed per eating occasion by persons 4 years of age or older, which is expressed in a common household measure that is appropriate to the food. When the article is represented to be for infants or for toddlers, a serving or serving size means an amount of food customarily consumed per eating occasion by infants through 12 months of age or by children 1 through 3 years of age. The term "portion" means an amount of food that is not typically expressed in a serving size, i.e., a food customarily used only as an ingredient in the preparation of other foods.

FSIS is proposing to define a single-serving container as a container or package containing less than 200 percent of the Reference Amount. The nutrition profile on the single-serving container will be declared on the total content of the container.

7. *Declaration of Number of Servings Per Container.* FSIS, like FDA, is proposing that the number of servings per package or container be declared to the nearest whole or approximate whole number. Manufacturers would be allowed to either declare the approximate serving size in household measure that results in a whole number of servings per package (e.g., serving size: approximately 3 oz.; number of servings per container: 10) or to declare the exact serving size in household measures and the approximate number of servings per container (e.g., serving size: 3 oz.; number of servings per container; approximately 10) (see FDA's docket 90N–0165, proposed 21 CFR 101.9 (b)(8)(i) and (ii)).

Regulations for the number of servings per package must be flexible enough to accommodate products in random weight packages. For random weight products such as kielbasa, manufacturers would have problems in declaring the number of servings per package. As a means of addressing this problem, FSIS is proposing to accommodate random weight packages by allowing manufacturers to declare the number of servings per container as "varied" provided the nutrition information is based on the Reference Amount expressed in ounces. The Agency is soliciting comments on whether this exception is a reasonable provision for this type of package.

8. *Use of Serving Size to Evaluate Nutrition Claims.* This issue is discussed in detail in Part VI, Descriptors.

VI. Descriptors

A. Background

The Standards and Labeling Division of FSIS has issued several policy memoranda, in connection with its label approval system, outlining quantitative criteria for permitting the use of selected descriptors such as "low calorie", "low sodium", "low fat", and "lean".[7] For many years, the Agency's definition for "lean", except as applied to ground beef, hamburger, and products containing added substances, such as water or extenders, has been no more than 10 percent fat content. The memoranda currently require at least a 25 percent reduction from specific reference points for comparative expressions such as "lower." FSIS also uses informal working policies for descriptors for some food constituents, such as cholesterol in meals and fiber. FSIS has no regulatory definitions for any descriptive terms.

To alleviate widespread public confusion associated with descriptors, the NLEA contains requirements regarding nutrient content claims. It precludes, except for specified limited exceptions, the use of any nutrient content term that characterizes the level of any nutrient that has not been defined by FDA by regulation, and requires FDA to define "free", "low", "light" or "lite", "reduced", "less", and "high". The NLEA places limitations on cholesterol, saturated fat, and dietary fiber claims for a food by requiring these claims to be accompanied by prominent disclosure of the food's level of fat or saturated fat, cholesterol, and total fat, respectively, on the label. The NLEA does not address the use of cholesterol claims based on threshold criteria for fat or saturated fat content.

Currently, FDA has regulatory definitions for descriptors about calories and sodium (21 CFR 101.13 and 105.66, respectively). On July 19, 1990, FDA published a tentative final rule, "Food Labeling; Definitions of the Terms Cholesterol Free, Low Cholesterol, and Reduced Cholesterol," to amend its food labeling regulations in order to define and provide for the proper use of these cholesterol descriptors (55 FR 29456). In the document, FDA tentatively proposed threshold levels for fat that establish conditions for the use of cholesterol content claims. FDA has developed informal policy for trial shelf-labeling programs covering descriptors for fat, fiber, calcium, and for defining "* * * source of," such as "good source of."

"The Surgeon General's Report of Nutrition and Health," issued in 1988, states that descriptive terms such as "low calorie," in compliance with FDA's regulations, may be helpful in informing people about the nutrient content of foods and encouraging their expanded use.[8]

B. Discussion of Comments and Proposal

In the ANPR, FSIS stated that uniform descriptors, when coupled with nutrition education efforts, could facilitate dietary improvement. FSIS anticipated adopting FDA developed descriptors. In addition, the ANPR proceeded to state that the definitions established by FDA were likely to be so restrictive that many meat and poultry products would be unable to use these descriptors. Therefore, FSIS suggested establishing some unique terms such as "lower" and "extra lean" that would be used only for meat and poultry products and to consider the use of other descriptors on a case-by-case basis under the prior label approval system.

There was overwhelming support for FSIS to adopt the same terminology and

[7] Copies of these policy memoranda are available for public review in the FSIS Hearing Clerk's office. Copies may be obtained, without charge, from the FSIS Hearing Clerk.

[8] The referenced portion of this report is available for public review in the FSIS Hearing Clerk's Office. Copies are available, without charge, from the FSIS Hearing Clerk.

definitions as FDA for descriptors for meat and poultry products. The majority of commenters believed that inconsistencies in nutrient content claims between meat and poultry products and all other foods would contribute to consumer confusion, and could create barriers to informed dietary choices.

Many manufacturers contended that it was important for product lines containing both FDA and USDA regulated products to be labeled in a similar or identical manner with descriptive terms that meet the same criteria. They further stated that differing descriptor definitions between the two agencies would not only confound their efforts in labeling conformity, but cause unnecessary confusion for the consumer and hinder any consumer education efforts.

FSIS agrees that inconsistent use of the same descriptive terms on USDA and FDA regulated products could lead to consumer confusion and nonuniformity in the marketplace. FSIS also acknowledges that different definitions would defeat the purpose of providing an effective nutrition education tool.

Based upon the review of the comments, FSIS is proposing the adoption of most of FDA's proposals, published elsewhere in this issue of the **Federal Register**, for 21 CFR 101.13, Nutrient Content Claims—General Principles; 21 CFR 101.54, Nutrient Content Claims for "Source" and "High"; 21 CFR 101.56, Nutrient Content Claims for "Light" or "Lite"; 21 CFR 101.60, Nutrient Content Claims for the Calorie Content; 21 CFR 101.61, Nutrient Content Claims for the Sodium Content of Foods; 21 CFR 101.62; Nutrient Content Claims for the Fat, Fatty Acids, and Cholesterol Content of Foods; and 21 CFR 101.69, Petitions for Nutrient Content Claims. In these documents, FDA has set forth proposals required by legislation in the NLEA.

FSIS has reviewed the rationale used by FDA for establishing the criteria for the regulations mentioned above and agrees with its approach, as discussed in the preamble to the nutrient content claims general principals, petitions, definition of terms proposal (91N–0384) and the definitions of nutrient content claims for the fat, fatty acids and cholesterol content of food proposal (84N–0153).

Since many products regulated by FSIS contain descriptive terms in the brand name ("brand name" is a generic term FSIS will use to define a fanciful name, trademark, etc.), FSIS believes a brief discussion to call attention to the use of descriptors in brand names is warranted. If a brand name includes a descriptive term which has been defined by FSIS, the product must meet the definition set for that term, and will have to bear an appropriate referral statement. The referral statement instructs the consumer to see the appropriate panel for more nutrition information; e.g., "See back panel for nutrition information."

Nutrient content claims not defined by regulation that appear as part of the brand name may be used on the label or in labeling if they are not false or misleading and only if the brand name was in use prior to November 27, 1991. The Agency specifically solicits comments on how best to determine when a term incorporated into a brand name should be regulated as a nutrient content claim.

FSIS is providing a petition process, consistent with FDA's, to permit certain types of claims, without requiring approval by regulation. Such claims would include terms that are consistent with a defined term (synonym) or implied claims made as part of the brand name. The approved synonyms would appear in a list and would be updated in the annual issuance of the CFR.

FDA is also proposing a separate document on health claims. In that document FDA states that it believes that the term "healthy" would be an inappropriate implied health claim for an individual food commodity. FDA is considering the possibility that the term "healthy" may be useful to the consumer in selecting meals that are helpful in achieving a total diet that conforms to the dietary guidelines. FDA is requesting comments and specific information on circumstances under which the term "healthy" on the label of a meal-type product would assist consumers in maintaining healthy dietary practices. If comments persuade FDA that the term "healthy" is an appropriate nutrient content claim for meal-type products, and provide criteria for the use of the term, they may provide for the term in a final regulation.

Likewise, FSIS is soliciting comments on the appropriateness and usefulness of the term "healthy" on the label of a meal-type product, and requests specific information on the criteria for the use of the term.

FSIS has compiled the following list of brand names from labels on file with the Standards and Labeling Division that include descriptive terms. Although the list is not all inclusive, the Agency believes it is useful to provide specific examples of some of the products that may be affected:

FDA is also proposing to address terms used for purposes other than making nutrient content claims, namely "fresh", "natural", and "organic." FSIS will accept any comments offered for the use and criteria for these terms; however, the Agency is concentrating its efforts on terms that characterize the level of a nutrient.

In the proposed 21 CFR 101.62, FDA defines terms that describe the fat, fatty acid, and cholesterol content of food, provides for the proper use of these terms, and provides for the use of comparative claims. FDA is proposing to require that fat, fatty acid, and

cholesterol content claims comply with the provisions of 21 CFR 101.13 as well as the provisions of 21 CFR 101.62. FSIS has examined the scientific background, the provisions of FDA's proposed regulation, the use of defined terms and comparative statements, and the conditions of use of defined terms as outlined in the document and supports its approach and justification (see docket 84N–0153 published elsewhere in this issue of the Federal Register).

FSIS realizes that by adopting FDA's proposed regulations, a few defined terms, such as "Cholesterol Free" and "Fat Free", may not be applicable at the present time to meat and poultry products. However, the Agency believes the best approach is to adopt FDA's proposed regulations in their entirety to minimize confusion and to provide for possible technological advances in the future.

Numerous comments from consumers, health professional trade organizations, trade associations, and the food industry urged FSIS to develop unique descriptors for meat and poultry products since they play a special role in the diet. There was overall support for the development of descriptors unique to meat and poultry products to help consumers differentiate products with lower levels of fat and cholesterol.

A few comments specifically addressed the adoption of the FDA "low fat" definition as excluding many FSIS regulated products and not allowing consumers to distinguish between products of varying fat content. Many comments supported the use of the terms "lean" and "extra lean" as unique descriptors since they are already in use, are readily identified as characterizing meat and poultry products, and are distinctly different from the terms defined by FDA.

There was opposition to establishing a definition for the term "lower" as a possible unique descriptor for meat and poultry products, as was suggested in the ANPR. Comments indicated that the descriptor "lower" is too close to the descriptor "low" and could be confusing.

The American Heart Association (AHA) submitted a letter to FSIS in response to the ANPR in which they propose fat, saturated fatty acids, and cholesterol thresholds for the term "lean" and "extra lean":

The term "lean" should be used to describe fresh and processed cooked meat and poultry (cut or ground) that meets the following thresholds (representing approximately 7% fat in raw and 10% fat in cooked meat by weight):

	Fat	Saturated fatty acids	Cholesterol
1 oz. cooked	<3 g	<1 g	<27 mg
3 oz. cooked	<8 g	<3 g	<80 mg

* * * the term "extra lean" should be used to describe fresh and processed cooked meat (cut or ground) that meet the following thresholds (representing approximately 5% fat by weight):

	Fat	Saturated fatty acids	Cholesterol
1 oz. cooked	<1.4 g	<0.5 g	<27 mg
3 oz. cooked	<4.3 g	<1.4 g	<80 mg

FSIS has considered these suggested values and has determined that the values have merit. As a criteria for establishing nutrient content claims, FDA based their calculations on the proposed Dietary Reference Values (DRV's) for that nutrient, average food consumption servings per day (16–20), and dietary guidance recommendations.

For meat and poultry products, Dietary Guidelines published by the Department of Agriculture and dietary recommendations published by the National Cholesterol Education Program suggest 6 ounces of these products per day, or two 3-ounce servings.

For purposes of nutrition labeling, the value of 75 g has been proposed as the DRV for fat, as discussed in the FDA's proposed supplemental rule 90N–0134 and 90N–0135. This value was derived from current dietary guidelines that recommend a person consume a maximum of 30 percent of calories from fat, which in a diet of 2,350 calories per day would allow for consumption of a maximum of 75 g of fat per day.

The proposed fat criteria for "lean" is <8 g per 3 ounces of cooked product. Two meat and poultry servings of the average 16–20 servings of food per day would account for <16 g of fat, or less than one-fourth of the DRV for fat. The remaining 14–18 servings of food, to meet the recommendation of no more than 75 g DRV for fat, could contain at least 59 g of fat.

The proposed fat criteria for "extra lean" is <4.3 g per 3 ounces of cooked product. Two meat and poultry servings of the average 16–20 servings of food per day would account for <8.6 g of fat, or less than one-seventh of the DRV for fat. The remaining 14–18 servings of food, to meet the recommendation of no more than 75 g DRV for fat, could contain at least 66.4 g of fat.

For purposes of nutrition labeling, the value of 25 g has been proposed as the DRV for saturated fat, as discussed in the FDA's proposed supplemental rule 90N–0134 and 90N–0135. This value was derived from current dietary guidelines that recommend a person consume less than 10 percent of calories from saturated fat, which in a diet of 2,350 calories per day would allow for consumption of about 25 g of saturated fat per day.

The proposed saturated fat criteria for "lean" is <3 g per 3 ounces of cooked product. Two meat and poultry servings of the average 16–20 servings of food per day would account for <6 g of saturated fat, or less than one-fourth of the DRV for saturated fat. The remaining 14–18 servings of food, to meet the recommendation of no more than 25 g DRV for saturated fat, could contain 19 g of saturated fat.

The proposed saturated fat criteria for "extra lean" is <1.4 g per 3 ounces of cooked product. Two meat and poultry servings of the average 16–20 servings of food per day would account for <2.8 g of saturated fat, or less than one-seventh of the DRV for saturated fat. The remaining 14–18 servings of food, to meet the recommendation of no more than 25 g DRV for saturated fat, could contain 22.2 g of saturated fat.

The value of 300 mg has been proposed as the DRV for cholesterol, as discussed in the FDA's proposed supplemental rule. This value was derived from recommendations from a wide variety of public health groups and organizations.

The proposed cholesterol criteria for "lean" and "extra lean" is <80 mg per 3 ounces of cooked product. Since cholesterol is only found in foods of animal origin, FSIS believes that the same value for both terms, with differing criteria for the fat and saturated fat, is required. Two meat and poultry servings of the average 16–20 servings of food per day would account for <160 mg of cholesterol slightly more than one-half of the DRV for cholesterol. The remaining 14–18 servings of food, to meet the recommendation of no more than 300 mg DRV for cholesterol, could contain 140 mg of cholesterol.

Fat, saturated fat, and cholesterol are not ubiquitous in the food supply. As mentioned previously, cholesterol is only found in foods of animal origin, and very little fat and saturated fat is found in most fruits, vegetables, and grains. Meat and poultry provide more of the fat, saturated fat, and cholesterol in the adult American diet than any other food group.

Therefore, FSIS finds merit in these suggested values, and believes these numbers recognize the practice of

dietary planning in which a person consumes servings of a variety of foods that contain different levels of fat, saturated fat, and cholesterol, and allow for a diet that will meet the dietary guidelines. FSIS believes, however, that the quantitative values should be proposed per 100 grams of product. Extrapolating the 1 ounce values which AHA suggested to 100 grams would yield the following values:

	Fat	Saturated fatty acids	Cholesterol
Lean	<10.5 g	<3.5 g	<94.5 mg
Extra Lean	<4.9 g	<1.8 g	<94.5 mg

The values for the fat content of 10.5 and 4.9 grams approximate the Agency's current definitions for the terms "lean" and "extra lean". Therefore, FSIS is proposing the above-listed values as the definitions for the terms "lean" and "extra lean" per 100 grams of product. FSIS is soliciting comments specifically on the appropriateness of these values and criteria for the definitions of the terms "lean" and "extra lean".

The Agency believes that, since FDA's proposed definitions for the descriptive terms "low fat" and "low cholesterol" are so restrictive, the unique descriptors should be applied to all meat and poultry products. Accordingly, the terms "lean" and "extra lean" could be used as descriptive terms on multi-ingredient meal-type products as well as muscle cuts of meat. Ground beef and hamburger would also be subject to the proposed definitions for the terms "lean" and "extra lean". Currently, FSIS extends special exception to ground beef and hamburger for the purposes of "lean" and "extra lean" labeling. "Lean" and "extra lean" ground beef and hamburger can contain up to 22.5 percent fat, a 25 percent reduction from the regulatory standard of 30 percent fat for these products. The Agency believes, however, that there is a need for definitions to be standardized and that these terms should be applied equally across all meat and poultry foods, with no exceptions granted.

Many comments recommended that FSIS not approve other descriptors on a case-by-case basis under the prior label approval process but establish definitions through a petition and rulemaking process that would provide full opportunity for public comment and would place the definitions in regulations. FSIS finds merit in these comments and is proposing a petition process to issue regulatory definitions for descriptors, approve the use of synonyms, and approve the use of implied nutrition content claims in fanciful names, brand names, and trademarks.

Descriptors relating to nutrition, other than those identified in this proposal, would require approval through the Agency's petition process as set forth in this proposal. The rulemaking process would furnish the Agency with the opportunity to carefully evaluate each petition, and allow a sufficient time for assessment and comment periods.

Several comments addressed the issue of "_____ percent fat free" claims. Comments were varied on this issue. A few comments suggested that the labeling of percentage of fat by weight is very deceptive and is of no use or value to the consumer in evaluating a product. A few comments suggested that "_____ percent fat free" labeling is a useful tool to consumers in appraising the fat content at a glance.

The Agency believes that "_____ percent fat free" claims can be useful and appropriate if used in the proper manner. The "_____ percent fat free" claims are generally used to indicate a relatively small amount of fat in a product. The impression that a product contains a small amount of fat is not necessarily reflected by a percent fat by weight statement. In FDA's proposed definitions of nutrient content claims for the fat, fatty acid, and cholesterol content of food (proposed 21 CFR 101.62), the issue of "_____ percent fat free" claims is discussed. FDA is proposing to prohibit the claim in those circumstances in which it would be misleading. To ensure that the consumer is not deceived, FDA is proposing that "_____ percent fat free" claims meet several criteria, discussed in FDA's docket 84N-0153, Section III, B(1), Amount and Percentage of Nutrient Claims. The FDA criteria is that the product has to meet the definition for "low fat" and the label or labeling discloses the amount of total fat per serving of the product. FSIS has reviewed the discussion and basis for the criteria and fully agrees with FDA's rationale, and is therefore proposing to adopt FDA's definition for "_____ percent fat free" claims.

VII. Compliance and Analytical Methods

A. Background

As part of its prior label approval process, FSIS requires manufacturers to submit analytical data to support nutrient values and content claims on food labels. The Agency processed approximately 180,000 requests for label approvals in 1990, of which 35 to 50 percent contained nutrition information. FSIS conducts a nutrition labeling verification program to ensure the continued accuracy of label information after initial approval. Under the program, manufacturers periodically submit analytical data on their products for Agency review. FSIS nutrition labeling guidelines for meat and poultry products, which address requirements for initial label approval and continuing accuracy of labels, are contained in Policy Memoranda 85B and 86.

FDA does not conduct prior label approval but places the responsibility for truthful labeling on industry. It set forth procedures for determining labeling compliance in its mandatory labeling proposal of July 19, 1990 (55 FR 29487). These procedures do not encompass determinations of substantial compliance with the voluntary labeling program for fresh produce and raw fish as described in FDA's proposed rule on nutrition labeling of raw fruit, vegetables, and fish (56 FR 30468). However, FDA proposed to exempt raw fruit, vegetables, and fish from its compliance procedures as described in the FDA booklet, "Compliance Procedures for Nutrition Labeling," [9] when the nutrition information is in accordance with an FDA-accepted data base, the nutrient values have been computed following FDA guidelines, and the food has been handled in accordance with current good manufacturing practices to prevent nutrient loss. Label nutrient values based on the FDA procedures give 95 percent assurance that for each nutrient contained in the labeled packages of a production lot from which samples were taken, nutrient values are at least equal to, and no less than, 80 percent of the label nutrient value for protein, vitamins, and most minerals and at least equal to, and no more than, 120 percent of the label nutrient value for calories, cholesterol, fat, and sodium. FDA has accepted a number of data bases for use in nutrition labeling of raw fruit and vegetables.

NAS generally addressed compliance issues in terms of the adequacy of analytical methods for nutrient analyses. It recognized that current methods of food analysis do not permit precise measurement of nutrient values for many food components and that the limitations of certain methods hinder the analytical process due to the volume of analyses that would be required under a mandatory nutrition labeling scheme. NAS recommended flexibility in selection of analytical methods for label

[9] This booklet, is available for public review in the FSIS Hearing Clerk's office.

verification and stated that "[a]lthough there are clear merits of the USDA system of label verification in terms of ensuring accuracy, management of the FDA system seems much less costly." It favored FDA and USDA certification of data bases containing representative values for use in labeling fresh food products. The NAS argued that, if compliance procedures applied to the labeling of fresh foods required adherence to 20 percent tolerances as are currently applied to the labeling of packaged foods, the labeling, in order to be in regulatory compliance, might grossly distort the average composition of the products.

In the ANPR, FSIS stated that it concurred with FDA's approach to labeling of fresh fruits and vegetables when such labeling is performed under voluntary guidelines, and that it supported the NAS recommendations on use of representative data base values for labeling of fresh products. The Agency also stated its belief that manufacturers of processed products, when such products are subject to mandatory nutrition labeling requirements, should certify that information submitted on requests for nutrition label approval complies with FSIS requirements. FSIS indicated that it assigns each manufacturer the responsibility for assuring the validity of a product's stated nutrient content by stating that "compliance with nutrition labeling requirements rightfully should be ensured by each establishment" through its quality control system, taking into account nutrient variability and adequacy of testing methods. FSIS specifically sought comments on reasonable tolerance levels which can reduce costs and frequency of testing.

B. Discussion of Comments and Proposal

The majority of the comments received in response to the ANPR regarding compliance and analytical method issues addressed the following areas: (1) The label approval requirements and nutrition labeling verification program, (2) use of data bases in labeling, and (3) the tolerance level compliance parameters.

1. *Label Approval and Nutrition Labeling Verification.* Most commenters expressed the opinion that FSIS should adopt a compliance program similar to that of FDA. There was almost no support for either the submission at the time of initial label approval of a specified number of analytical results that establish the initial nutrient data base for a product or for the nutrition labeling verification program. The most frequently cited reasons for these positions were the high cost of testing and the burden the requirements imposed.

FSIS maintains that the manufacturer is responsible for insuring the validity of nutrient content expressed on the food label in conformance with the requirements set forth in these regulations. The Agency believes that its approach to inspection, which calls for an inspector in every federally inspected establishment and prior approval of labels before use, allows FSIS employees the opportunity to observe plant controls over product formulation and processing and to review the nutrition panel and claims while having a product's quantitative ingredient listing on hand. Therefore, the Agency concludes that the requirements for submission of laboratory data with requests for initial label approvals, the submission of periodic data to support the continuing accuracy of food labels, and maintenance of FSIS-approved nutrition labeling verification procedures are unnecessary. Instead, FSIS will require manufacturers to maintain records to support the nutritional values on the nutrition panel of food labels and to make this information available for review by Agency personnel upon request. The frequency of testing for nutrient content to support nutritional values may vary with the identity of the nutrients to be tested, sample size and number of samples, nature of the product, and the like.

The Agency is especially concerned about the accuracy of nutrient content claims, such as "low sodium" and "low fat", and percentage labeling on food labels. These claims are very visible types of information that are often used for marketing purposes, may readily affect consumers' purchasing decisions, and carry potential for public harm should they be false. Consequently, the Agency concludes that, when labeling material containing nutrient content claims is submitted for approval, FSIS would require that a plant operated partial quality control (PQC) program (9 CFR 318.4 (d) and (e) and 381.145 (d) and (e)) be established for the nutrients which are the subject of such claims, as well as any other nutrients conditioning the use of such claims, as a necessary source of information in determining label compliance. The PQC program will provide the controls and information necessary to give a high degree of assurance that the products will meet the labeling claims and that the variability of the products will remain within the limits defined in these regulations. Monitoring of these inplant PQC programs by inspection personnel will serve as a tool to help to ensure labeling compliance.

2. *Use of Data Bases.* Respondents to the ANPR voiced almost unanimous support for use of representative data base values for labeling of fresh meat and poultry products. Many expressed the opinion that use of data base values, either FSIS-approved or private, be extended to processed products as well as to reduce analytical costs. FSIS considers use of data base values for single-ingredient, raw products (fresh) and their use for all other products as two distinct issues.

a. Single Ingredient Products. NAS recommended that USDA promulgate regulations that mandate nutrition labeling for the 20 to 30 top items of fresh/frozen meat and poultry products and suggested that values be provided using point-of-purchase information developed from data base values. It recognized that USDA's National Nutrient Data Bank (NNDB), whose published form is the AH–8 series, is the authoritative source of data on the nutrient composition of foods in the United States. NAS stated that USDA food composition data are relatively complete for a variety of cuts and grades of beef, and fairly complete for poultry products, pork products, lamb, and veal. Some of these data on beef, fresh pork, and lamb were used in developing Meat Nutri-Facts. FSIS is aware that information on beef and lamb products has been updated in the AH–8 series since Meat Nutri-Facts was published; that pork products are currently being updated using results from a nationwide survey on retail cuts of pork; and that information on poultry products is being updated to include new data developed for use with Poultry Nutri-Facts and other research. Many of the studies conducted to generate these food composition values were large in scope and involved the collaborative efforts of USDA, industry, and academia. The Agency accepts the results of the research efforts as adequately characterizing the nutrient profiles of retail cuts of beef (including ground beef), fresh pork, lamb, veal, chicken, and turkey. FSIS concludes that the representative values for these foods as contained in the NNDB or its published form, the AH–8 series, are appropriate for generic labeling of single-ingredient, raw meat and poultry products under the voluntary guidelines set forth in these regulations.

FSIS believes that use of nationally representative, year-round nutritional values for single-ingredient, raw meat and poultry products will be of most use

in assisting consumers in maintaining healthy dietary practices. Use of representative mean values averages out the nutrient variability of these products and more accurately represents their nutrient content over time. Composite labeling takes into consideration the factors responsible for nutrient variation, examples of which include quality grades for beef and classes for turkey. The Agency's position on the labeling of single-ingredient, raw meat and poultry products is supported by NAS which recommended flexibility in the nutrition information required for labeling fresh foods. NAS stated that "[r]egulatory compliance could be accomplished through less stringent regulations that permit the use of representative data (e.g., the mean or the mean ± one standard deviation) instead of the tolerances currently applied to nutrition labeling of packaged food."

As discussed under the Guidelines for Voluntary Nutrition Labeling elsewhere in this preamble, representative data base values may be used for generic labeling of single-ingredient, raw meat and poultry products either on the label of the product or through use of point-of-purchase materials. FSIS considers appropriate generic labeling values to be those from the NNDB or AH–8 for the six species discussed above. A list of 45 cuts which the Agency considers as the most popular cuts that fairly represent different anatomical locations of poultry and primal cuts of meat is included under the Guidelines. Data for additional cuts of the six species also may be used in labeling. Considering industry's past efforts in developing and providing nutritional information on cooked meat and poultry products through the Nutri-Facts programs, FSIS believes it is appropriate that nutritional information be presented on either a cooked basis or a raw basis for single-ingredient, raw products under the voluntary program. If information is presented on a cooked basis, the cooking methods should be recommended methods commonly used for the product by consumers and should not add fat, flour, salt, or other ingredients which could alter nutritional profiles.

FSIS believes that use of composite data is appropriate because their use reduces the burden for retailers and provides uniform and consistent data for consumers. FDA presents a detailed discussion, with which FSIS concurs, of the advantages and disadvantages of the use of composite nutrient values in its proposal on nutritional labeling of raw fruits, vegetables, and fish (56 FR 30475). FSIS believes that when representative data base values are used on a label applied to a product which is also labeled as a component food of a composite value as shown in AH–8, the representative values for the component food should be used instead of composite values. Thus, if a nutrition label is applied to a cut of beef labeled Choice grade, representative values from AH–8 for the appropriate Choice grade cut as opposed to values for the same cut designated as "all-grades" should be used. Values for "all-grades" are composite values derived by weighting representative values for Select, Choice, and Prime grades for each grade's market share. FSIS invites comments on the aptness of this approach.

The Agency received several comments to the ANPR regarding the use of data for separable lean of red meat and skinless poultry meat, which was the approach used in the Nutri-Facts programs. The Agency has no evidence to support the appropriateness of using values for separable lean tissue instead of total edible tissue for red meat or values for skinless poultry meat instead of poultry meat with skin. Therefore, FSIS concludes that appropriate nutritional values for single-ingredient, raw meat and poultry products are those for meat cuts with external cover fat at trim levels reflecting current market practices and for poultry cuts with skin. The additional, optional listing of nutrients for the separable lean cuts of meat and skinless poultry also would be appropriate because it gives consumers comparative information for use in deciding to trim fat from meat and take skin off poultry before eating, as is recommended in the Dietary Guidelines for Americans. If nutrition labels bearing representative data base values are applied to packages of cuts of meat or poultry, FSIS believes the values selected must be those that represent the meat or poultry tissues in the package, i.e., values for a skinless cut of poultry must only be used on labels of packages containing poultry cuts from which the skin has been removed.

When representative data base values from the NNDB or AH–8 are used on the labeling or labels of single-ingredient, raw products, FSIS is proposing that such products will not be subject to Agency compliance review as established for the mandatory program. If a nutrient content claim is made on the basis of representative data base values, products must meet the criteria for such claims as set forth in FSIS regulations and be produced under a PQC program. These products will be sampled to measure compliance with the regulations and such claims will not be allowed on the labels of products which fail to meet the criteria. If industry practices change or FSIS monitoring suggests that the representative nutrient values have changed, the Agency will object to the use of claims based on these values and will work with USDA's Human Nutrition Information Service and affected parties to update the representative data base values used for generic labeling of fresh products. FSIS does not discourage the use of private data base values for single-ingredient, raw meat and poultry products. These are especially relevant when producers want to point out unique nutritional characteristics of their products. However, products so labeled would be subject to all of the requirements of the mandatory labeling program as set forth in these regulations and Agency compliance procedures, except that data may be presented on either a raw or cooked basis. FSIS believes this exception is necessary to provide flexibility and to reduce the economic impact on the affected industry.

b. All Other Products. As indicated before, a number of commenters expressed the opinion that use of data base values be extended to processed products to reduce testing costs. The issue is whether FSIS should continue to require that food labels reflect the nutrient composition of the specific products as determined by analysis of individual lots of products or whether use of representative data base values could be substituted for actual analyses. Likewise, an issue is whether nutrition profiles should be developed for multicomponent products using calculations or recipe programs based on data base values as a substitute for actual analyses.

The Agency is not convinced that blanket approval of the use of data base values for processed products with elimination of compliance requirements and review is warranted. The use of data base values and calculations is likely useful in predicting nutrient profiles, especially when products are reformulated, but such use as the sole basis for nutrition profiles of individual food items may present a risk to manufacturers. Generally, data base values reflect a diverse food supply and, in many instances, can only approximate the nutrient content of specific product samples. Their use, however, might result in decreased testing costs because a smaller number of analyses might serve to assure

applicability of data base values to specific products or to corroborate the accuracy of calculated values than would need to be performed to establish an initial data base in the absence of such information.

3. Compliance Parameters. The adequacy of the 80/120 tolerance levels for naturally occurring nutrients was supported by most commenters who addressed this issue. The overall theme of the responses was that FSIS compliance requirements should track those of FDA. The Agency proposes to retain the 80/120 tolerance levels, which it currently uses, for naturally occurring nutrients and to define these as Class II nutrients in determining compliance with the regulations. FSIS has little experience with nutrients added in fortified or fabricated foods unless specific regulations permit their addition, as in the case of adding vitamin A to margarine (9 CFR 319.700). FDA defines such added nutrients for purposes of compliance as Class I nutrients under 21 CFR 101.9(e)(3). FSIS proposes to define added nutrients as Class I nutrients and establish tolerance levels for purposes of compliance which are identical to those of FDA.

FSIS leaves it to the company to determine label declarations. FSIS will take random samples for checking compliance, and the composite values must fall within 80/120 percent of the stated nutrient value in each case.

FSIS current nutrition labeling guidelines state that ideally analyses should be performed on a composite of 12 units, one from each of 12 consecutive production lots. FDA currently determines compliance on 12 units taken one from each of 12 randomly chosen shipping cases, to be representative of a lot. In describing how it will determine compliance with its nutrition labeling requirements, FSIS is proposing that analyses be conducted on a composite consisting of a minimum of six units selected within or across lots. FSIS will monitor a minimum of six units for compliance. In most cases, the number of samples taken will be 12, whenever it is feasible and not too costly. However, for various products, such as large samples of ham, FSIS believes a composite of six units will contribute to cost and logistical efficiency. The Agency believes that within lot sampling within an establishment and across lot sampling outside an establishment are both valuable options. FSIS personnel will not be limited to collection of samples during production of products at an establishment. They will have the added flexibility to draw samples at the wholesale and retail levels.

The USDA methodology and procedures used to determine compliance with the regulations are those approved by the Administrator in accordance with the "Chemistry Laboratory Guidebook." If the Department does not have an analytical method approved by the Administrator in each case, it shall determine compliance using methods prescribed in the current edition of the Official Methods of Analysis of the Association of Official Analytical Chemists (AOAC), or those specified under 21 CFR 101.9(c) when neither USDA nor AOAC methods are available. If the use of a method will result in a significant (10 percent or greater) under representation of caloric value or misrepresentation of an available nutrient (e.g., mono- and diglycerides are not detected with the AOAC methods for fat), such that the nutrients whose intakes should be limited appear to be present at lower levels than is actually the case, then a more appropriate method of analysis should be used. This concern raised about the applicability of methods in certain circumstances is discussed further in FDA's mandatory labeling proposal of July 19, 1990. USDA is also concerned about the analytical methodologies for sugars and concurs with FDA's discussion of the problems as presented in the same proposal. Both the FDA and FSIS proposed definitions for sugars include tri- and tetrasaccharides; however, the widely used laboratory methods employing high performance liquid chromatography measure mono- and disaccharides. This poses a compliance problem because there is no AOAC laboratory method to measure tri- and tetrasaccharides. FSIS seeks comments on appropriate methods for the analysis of sugars as they are defined in these proposed regulations.

In the event that FSIS employees, through FSIS monitoring of samples, determine that products do not meet the compliance parameters set forth in these proposed regulations, the establishments would be notified to take whatever corrective actions are necessary for the nutrient content of a subsequent production to be in accordance with labeling declarations. Failure to provide a response within 30 days may cause approval to use the labeling material in official establishments to be withdrawn. Before approval to use a labeling material is finally withdrawn by the Administrator, the affected establishment would be given notice and the opportunity to present its views to the Administrator in accordance with the applicable rules of practice as established in 9 CFR 335.12.

VIII. Health Messages

FSIS does not permit health claims, i.e., those explicitly linking food attributes to disease or health-related conditions. However, FSIS does permit the inclusion on labels of health recommendations from authoritative sources such as the National Cholesterol Education Program and references on how a food can fit into general recommendations for a total diet.

The NLEA requires FDA to adopt health-claim regulations prohibiting health claims for foods which FDA determines to contain any nutrient in an amount that increases the risk of persons in the general population to a diet-related disease, taking into account the contribution of the food in the daily diet.

On February 13, 1990, FDA published a reproposal on health messages and label statements to protect consumers from false or misleading health claims and to ensure provisions of accurate information (55 FR 5176). The health claims issue is still under study by FDA and FSIS. Upon completion of these studies, FSIS will publish a separate proposed regulation on health claims in line with FDA's proposal.

IX. Format

The format in which nutrition labeling is presented is an important topic being

investigated by FDA and the industry. FDA has initiated a pilot program to test alternative nutrition label formats. FDA experts will use the results of this program to propose changes to the format of the nutrition label. FSIS is working closely with FDA to ensure that the same format will be used by both agencies.

FDA's preliminary review of comments received on the mandatory nutrition labeling and RDI/DRV proposal indicate a great consumer interest in having reference values become a part of nutrition labeling. FDA believes that the use of the DRV's will help meet the 1990 amendments and is therefore proposing to make them mandatory in some form. In the interest of harmonization, FSIS is also proposing to make the DRV's mandatory. How they will be expressed within nutrition labeling and in what form is the subject of further format research. FSIS will propose a nutrition label format in a separate document after the results of current studies are received.

X. Food Ingredients and Standards of Identity

In the ANPR, FSIS addressed its belief that concerns relating to ingredients and standards, which currently attract the most attention, include possibly incomplete ingredient statements on packaged products, including standardized foods; the impact of "and/or" labeling of fats and oils on consumers' ability to judge the amount of saturated fat in a product; and the concern that existing food standards may impede development of substitute products that are lower in calories, fat, cholesterol, and sodium. Since FSIS requires full ingredient labeling on all meat and poultry products, including standardized products, this issue may not present a problem for the labeling of meat and poultry products.

The Agency believes that concerns about disjunctive labeling of fats and oils can be resolved by proper labeling of saturated fat. Because USDA standards of identity and composition do not require minimum fat contents, development of products with desirable characteristics is not hampered by minimum fat criteria. However, levels for minimum amounts of meat and poultry are a part of most standards. These criteria protect consumers against economic fraud and dilution of beneficial micronutrients and protein expected in certain products. Due to the shift of concern from problems connected to underconsumption to those associated with overconsumption of certain food components such as fat, FSIS plans to reassess this matter after completing its rulemaking on nutrition labeling.

XI. Prior Label Approval

FSIS requires that all labels proposed for use on meat and poultry products be approved under the Agency's prior label approval process before their use on such products. Conversely, FDA does not administer a prior label approval system, but monitors labeling of other foods primarily through periodic surveillance at the marketplace.

Concerns have been expressed by various affected parties as to the divergence between FSIS and FDA regarding the monitoring of labeling compliance. As a result, efforts are underway to assess the Agency's prior label approval process in terms of internal management, organizational structure, and program effectiveness. The Department has commissioned an evaluation of all aspects of FSIS's organization and management systems, including prior label approval, and their ability to assure a safe, wholesome supply of meat and poultry to consumers. The evaluation will include alternatives which could increase the Agency's effectiveness and efficiency. Results of this evaluation will provide FSIS the information necessary to consider possible changes in the prior label approval process.

FSIS has also initiated a plan to modernize internal systems and procedures for the prior label approval process. Every aspect of prior label approval is being assessed to identify those areas where modifications may be made to facilitate a more efficient label process while responding to consumers' demand for more informative labels.

If adopted, this nutrition labeling rulemaking would require the labels for meat and poultry products, except single ingredient, raw products and products used for further processing, to be revised and submitted for review by the Agency. FSIS acknowledges the significant economic impact that would be imposed upon the affected meat and poultry industry, as well as the need for substantive resources from the Agency to review all such revised labels.

FSIS is interested in receiving comments through this rulemaking proceeding as to whether modifications should be made to the Agency's label approval process and, if so, how such changes should be accomplished. FSIS is also seeking comments on whether the prior approval process should be eliminated. Such comments would assist FSIS in its assessment of label procedures.

XII. Implementation

The NLEA mandates deadlines for FDA's publication and implementation of mandatory nutrition labeling regulations. The implementation date, except for a few exceptions, set by the NLEA for mandatory nutrition labeling and health claims is May 1993. In order to provide consumers with a complete nutrition labeling program, FSIS plans to follow FDA's mandated timeframe.

FSIS also examined several alternative implementation timeframes for companies complying with the nutrition labeling regulations and the costs associated with each. The compliance periods examined were 6, 12, and 24 months with single- and multi-analytical tests per product. The results indicate that the longer the compliance period, the lower the per-company compliance costs. (Refer to the Preliminary Regulatory Impact Analysis for further discussion on compliance costs.) FSIS is interested in receiving comments from industry concerning the implementation period for the nutrition labeling regulation.

FSIS also seeks comments on whether companies should be permitted to use existing labels, especially those labels containing nutrition information, for some period of time beyond the implementation date in order to exhaust existing label inventory.

Within 6 months of the publication of this document, FSIS intends to publish a notice in the **Federal Register** announcing the intended implementation date.

Proposal

For the reasons discussed in the preamble, FSIS is proposing to amend 9 CFR parts 317, 320, and 381 of the Federal meat and poultry products inspection regulations to read as follows:

List of Subjects

19 CFR Part 317

Food labeling, Meat inspection.

9 CFR Part 320

Reporting and recordkeeping.

9 CFR Part 381

Food labeling, Poultry and poultry products, Reporting and recordkeeping.

PART 317—LABELING, MARKING DEVICES, AND CONTAINERS

1. The authority citation for part 317 would continue to read as follows:

Authority: 21 U.S.C. 601–695; 7 CFR 2.17, 2.55.

2. Part 317 would be amended by redesignating the current § § 317.1 through 317.24 as subpart A—General, and by adding a new subpart B—Nutrition Labeling to read as follows:

Subpart A—General

Sec.
317.1–317.24
* * * * *

Subpart B—Nutrition Labeling

317.300 Nutrition labeling of meat products.
317.301 [Reserved]
317.302 Location of nutrition information.
317.303–317.307 [Reserved]
317.308 Labeling of meat products with number of servings.
317.309 Nutrition label content.
317.310 [Reserved]
317.311 [Reserved]
317.312 Reference amounts customarily consumed per eating occasion.
317.313 Nutrient content claims; general principles.
317.314–317.342 [Reserved]
317.343 Significant participation for voluntary nutrition labeling.
317.344 Identification of major cuts of meat products.
317.345 Guidelines for voluntary nutrition labeling of single-ingredient, raw products.
317.346–317.353 [Reserved]
317.354 Nutrient content claims for "source" and "high".
317.355 [Reserved]
317.356 Nutrient content claims for "light" or "lite".
317.357–317.359 [Reserved]
317.360 Nutrient content claims for calorie content.
317.361 Nutrient content claims for sodium content.
317.362 Nutrient content claims for fat, fatty acids, and cholesterol content of meat products.
317.363–317.368 [Reserved]
317.369 Petitions for nutrient content claims.
317.370–317.379 [Reserved]
317.380 Label statements relating to usefulness in reducing or maintaining body weight.
317.381–317.399 [Reserved]
317.400 Exemption from nutrition labeling.

Subpart B—Nutrition Labeling

§ 317.300 Nutrition labeling of meat products.

(a) Nutrition labeling shall be provided for all meat products, except single-ingredient, raw products, in accordance with the requirements of § 317.309, unless the product is used for further processing as provided in § 317.400 of this subpart.

(b) Nutrition labeling may be provided for single-ingredient, raw meat products in accordance with the requirements of § 317.309 and § 317.345. Significant participation in voluntary nutrition labeling shall be measured by the Agency in accordance with §§ 317.343 and 317.344 of this subpart.

§ 317.301 [Reserved]

§ 317.302 Location of nutrition information.

(a) Nutrition information on a label of packaged meat products shall appear on the label's principal display panel or on the information panel, except as provided in paragraph (b) of this section.

(b) Nutrition labeling information for individually wrapped packages of meat products of less than ½ ounce net weight and products packaged in other than consumer-size packages may be shown at a location other than on the product label, provided that the labels for these products bear no nutrition claims. In lieu of on the product label, nutrition information may be displayed as follows:

(1) Product label inserts, as provided in § 317.4(c), and

(2) Point of purchase information supplied by the manufacturer.

§§ 317.303–317.307 [Reserved]

§ 317.308 Labeling of meat products with number of servings.

The label of any package of a meat product that bears a representation as to the number of servings contained in such package shall meet the requirements of § 317.2(h)(10).

§ 317.309 Nutrition label content.

(a)(1) All nutrient and product component quantities shall be declared in relation to a serving or, where the product is customarily not consumed directly, to a portion, as defined in 21 CFR 101.9(b) (1) through (3) and 21 CFR 101.9(b) (5) through (8).

(2) The declaration of nutrient and product component content shall be on the basis of the product "as packaged" for all products, except that single-ingredient, raw products may be declared on the basis of the product "as consumed" as set forth in § 317.345(a)(1). In addition to the required declaration on the basis of "as packaged" for products other than single-ingredient, raw products, the declaration may also be made on the basis of "as consumed."

(3) Another column of figures may be used to declare the nutrient and product component information on the basis of 100 grams or 100 milliliters of the product. This information shall be shown as required in paragraph (a)(2) of this section.

(b) The declaration of nutrition information on the label shall contain the following information, except for that which is identified as "VOLUNTARY" or for those meat products where an abbreviated format must be used as provided for in paragraph (e) of this section. Information shall be presented in the following order, using the headings, specified and displayed with equal type size under the overall heading of "NUTRITION INFORMATION PER SERVING (PORTION)." Alternatively, the terms "PER SERVING (PORTION)" may be placed directly below the terms "NUTRITION INFORMATION." Definitions, units of measure, increments for declaring values, and methods of calculation shall be in accordance with 21 CFR 101.9(c) (1) through (10).

(1) "Serving (portion) size",

(2) "Servings (portions) per container",

(3) "Caloric content" or "Calories",

(i) "Calories from total fat",

(ii) "Calories from saturated fat", "Calories from unsaturated fat", "Calories from total carbohydrate", and "Calories from protein" (VOLUNTARY),

(A) "Calories from saturated fat" or "Calories from saturated",

(B) "Calories from unsaturated fat" or "Calories from unsaturated",

(C) "Calories from total carbohydrate",

(D) "Calories from protein",

(4) "Total fat content" or "Total fat",

(i) "Saturated fat content", "Saturated fat", or "Saturated",

(ii) "Unsaturated fat content", "Unsaturated fat", or "Unsaturated" (VOLUNTARY),

(A) "Polyunsaturated fat" or "Polyunsaturated",

(B) "Monounsaturated fat" or "Monounsaturated",

(5) "Cholesterol content" or "Cholesterol",

(6) "Total carbohydrate content" or "Total carbohydrate",

(i) "Complex carbohydrate content" or "Complex carbohydrate",

(ii)(A) "Sugars content" or "Sugars",

(B) "Sugar alcohol content" or "Sugar alcohol" (VOLUNTARY),

(7) "Dietary fiber content" or "Dietary fiber",

(i) "Soluble and insoluble fiber" (VOLUNTARY),

(A) "Soluble fiber",

(B) "Insoluble fiber",

(ii) "Total dietary fiber," "soluble dietary fiber", and "insoluble dietary fiber content",

(8) "Protein content" or "Protein",

(i) A statement of the corrected amount of protein per serving calculated as a percentage of the Reference Daily Intake (RDI) for protein and expressed as "Percent of Daily Value",

(ii) The "Corrected amount of protein (gram) per serving (portion)", and

(iii) For the purpose of labeling with a percent of the RDI, a value of 50 grams of protein shall be the RDI for adults and children 4 or more years of age, 16 grams of protein for children less than 4 years of age, and 14 grams of protein for infants.

(9) "Sodium content" or "Sodium",

(10) "Potassium content" or "Potassium" (VOLUNTARY),

(11) Under the heading "Percent of Daily Value": A statement of the amount per serving (portion) of the vitamins and minerals expressed as a percent of the RDI, in accordance with 21 CFR 101.9(c)(11), and

(12) "Nutrition Profile" in accordance with 21 CFR 101.9(c)(12).

(c) [Reserved]

(d)(1) If a product consists of assortments of meat products (e.g., variety packs) in the same package, nutrient content shall be expressed on the entire package contents or on each individual product.

(2) If a product is commonly combined with other ingredients or is cooked or otherwise prepared before eating, and directions for such combination or preparations are provided, another column of figures may be used to declare the nutrient contents on the basis of the product as consumed for the product alone (e.g., a cream soup mix may be labeled with one set of Daily Values for the dry mix (per serving), and another set for the serving of the final soup when prepared (e.g., per serving of cream soup mix and 1 cup of vitamin D fortified whole milk)): *Provided*, That, the type and quantity of the other ingredients to be added to the product by the user and the specific method of cooking and other preparation shall be specified prominently on the label.

(e) The abbreviated format shall be in accordance with 21 CFR 101.9(f) (1) through (4).

(f) The Reference Daily Intakes and Daily Reference Values used shall be in accordance with 21 CFR 101.9(c)(8) (i) and (iii), 11(iv), and (12)(i).

(g) Compliance with this section shall be determined as follows:

(1) A production lot is that product from one production shift. Alternatively, a collection of primary containers or units of the same size, type, and style produced under conditions as nearly uniform as possible, designated by a common container code or marking, constitutes a lot.

(2) The sample for nutrient analysis shall consist of a composite of a minimum of six finished production units, one from each of six production lots. Alternatively, the sample for nutrient analysis shall consist of a composite of a minimum of six subsamples (consumer units), each taken from a randomly chosen shipping case, to be representative of a lot. Composites shall be analyzed by appropriate methods and procedures used by the Department for each nutrient in accordance with the "Chemistry Laboratory Guidebook," or, if no USDA method is available or appropriate in each case, by appropriate methods for each nutrient in accordance with the 1990 edition of the "Official Methods of Analysis of the Association of Official Analytical Chemists" (AOAC), 15th ed., which is incorporated by reference, unless a particular method of analysis is specified in 21 CFR 101.9(c), or, if no USDA, AOAC, or specified method is available and appropriate, by other reliable and appropriate analytical procedures. Copies of the AOAC Methods are available from the Association of Official Analytical Chemists, 2200 Wilson Blvd., Suite 400, Arlington, VA 22201.

(3) Two classes of nutrients are defined for purposes of compliance:

(i) Class I. Added nutrients in fortified or fabricated foods; and

(ii) Class II. Naturally occurring (indigenous) nutrients. If any ingredient which contains a naturally occurring (indigenous) nutrient is added to a food, the total amount of such nutrient in the final food product is subject to Class II requirements unless the same nutrient is also added.

(4) A product with a label declaration of a vitamin, mineral, protein, total carbohydrate, complex carbohydrate, dietary fiber, unsaturated fat, or potassium shall be deemed to be misbranded under section 1(n) of the Federal Meat Inspection Act (21 U.S.C. 601(n)(1)) unless it meets the following requirements:

(i) Class I vitamin, mineral, protein, total carbohydrate, complex carbohydrate, dietary fiber, unsaturated fat, or potassium. The nutrient content of the composite is at least equal to the value for that nutrient declared on the label.

(ii) Class II vitamin, mineral, protein, total carbohydrate, complex carbohydrate, dietary fiber, unsaturated fat or potassium. The nutrient content of the composite is at least equal to 80 percent of the value for that nutrient declared on the label: *Provided*, That no regulatory action will be based on a determination of a nutrient value which falls below this level by a factor less than the variability generally recognized for the analytical method used in that product at the level involved.

(5) A product with a label declaration of calories, sugars, total fat, saturated fat, cholesterol, or sodium shall be misbranded under section 1(n) of the Federal Meat Inspection Act (21 U.S.C. 601(n)(1)) if the nutrient content of the composite is greater than 20 percent in excess of the value for that nutrient declared on the label.

(6) The amount of a vitamin, mineral, protein, total carbohydrate, complex carbohydrate, dietary fiber, unsaturated fat, or potassium may vary from the labeled amounts within good manufacturing practice.

(7) The management of the establishment must maintain records to support the validity of nutrient declarations contained on product labels. Such records shall be made available to the inspector or any duly authorized representative of the Agency upon request.

(8) A prerequisite for obtaining approval for labeling containing nutrient content claims as defined in these regulations is that an establishment has an approved partial quality control program as provided in § 318.4(d) to result in compliance with these provisions.

(9) The compliance provisions set forth in paragraph (g) (1) through (7) of this section shall not apply to single-ingredient, raw meat (including ground beef) products, including those that have been previously frozen, when nutrition labeling is based on the most current representative data base values contained in USDA's National Nutrient Data Bank or its published form, the Agriculture Handbook No. 8 series.

(h) Nutrition information provided by a manufacturer or distributor directly to professionals (e.g., physicians, dietitians, and educators) may vary from the requirements of this section, but shall also contain or have attached to it the nutrition information as required by this section.

§ 317.310 [Reserved]

§ 317.311 [Reserved]

§ 317.312 Reference amounts customarily consumed per eating occasion.

(a) The general principles followed in arriving at the Reference Amounts for serving (portion) sizes set forth in paragraph (b) of this section are found in 21 CFR 101.12 (a) through (g), except paragraph (b).

(b) The following Product Categories and Reference Amounts shall be used as the basis for determining serving sizes for specific products:

TABLE 1.—REFERENCE AMOUNTS CUSTOMARILY CONSUMED PER EATING OCCASION INFANT AND TODDLER FOODS [1 2 3]

Product category	Reference amount
Infant and toddler foods:	
Dinner dry mix	15 g
Dinner, ready-to-serve, strained type.	60 g
Dinner, soups, ready-to-serve junior type.	110 g
Dinner, stew or soup ready-to-serve toddlers.	170 g

[1] These values represent the amount of food customarily consumed per eating occasion and were primarily derived from the 1977–1978 and the 1987–1988 Nationwide Food Consumption Surveys conducted by the U.S. Department of Agriculture.

[2] Unless otherwise noted in the Reference Amount column, the reference amounts are for the ready-to-serve or almost ready-to-serve form of the product (i.e., heat and serve). If not listed separately, the Reference Amount for the unprepared form (e.g., dehydrated cereal) is the amount required to make one Reference Amount of the prepared form.

[3] Manufacturers are required to convert the Reference Amount to the label serving size in a household measure most appropriate to their specific product using the procedures established by regulation.

TABLE 2.—REFERENCE AMOUNTS CUSTOMARILY CONSUMED PER EATING OCCASION GENERAL FOOD SUPPLY [1 2 3]

Product category [4]	Reference amount
Egg Mixtures, e.g., western style omelet, souffle, egg foo young.	110 g
Lard, lard, margarine, shortening	1 tbsp
Salad and potato toppers, e.g., bacon bits.	7 g
Bacon, e.g., bacon, beef breakfast strips, pork breakfast strips.	15 g
Dried, e.g., jerky, dried beef, sausage products with a moisture/protein ratio of less than 2:1, e.g., pepperoni.	30 g
Snacks, e.g., meat snack food sticks, pork rinds.	30 g
Luncheon meat, bologna, Canadian style bacon, Vienna sausages, frankfurters, pork pattie crumbles, beef pattie crumbles, blood pudding, pork sausage, luncheon loaf, old fashioned loaf, berlinger, imitation frankfurters, bangers, brotwurst, kielbasa, minced luncheon roll, Polish sausage, summer sausage, thuringer, liver sausage, mortadella, liverwurst, uncured sausage (franks), ham and cheese loaf, P & P loaf, scrapple, souse, head cheese, pizza loaf, olive loaf, pate, deviled ham, sandwich spread, mettwurst, smoked country sausage, teawurst, cervelet, Lebanon bologna, potted meat food product, taco fillings, meat pie fillings.	55 g
Smoked or pickled, meat pickled pigs feet, smoked sausage.	55 g

TABLE 2.—REFERENCE AMOUNTS CUSTOMARILY CONSUMED PER EATING OCCASION GENERAL FOOD SUPPLY [1 2 3]—Continued

Product category [4]	Reference amount
Entrees without sauce, cuts of meat including marinated, tenderized, injected cuts of meat, beef patty, corn dog, bagel dog, croquettes, fritters, cured ham, dry cured ham, dry cured cappicola, Parma ham, corned beef, pastrami, country ham, pork shoulder picnic, meatballs, pureed adult foods.	85 g
Canned meats, canned beef, canned pork.	85 g
Entrees with sauce, barbecued meats in sauce.	140 g
Mixed dishes, NOT measurable with a cup, e.g., burrito, egg roll, enchilada, pizza, pizza roll, quiche, all types of sandwiches, cracker and meat lunch-type packages, gyro, stromboli, burger on a bun, frank on a bun, calzone, taco, pockets stuffed with meat, foldovers, meat lasagna, stuffed vegetables with meat, shish kabobs, empanada.	140 g (plus 55 gms for products with sauce toppings)
Mixed dishes, measurable with cup, e.g., meat casserole, macaroni and cheese with meat, pot pie, spaghetti with sauce, meat chili, chili with beans, meat hash, creamed chipped beef, beef ravioli in sauce, beef stroganoff casserole, Brunswick stew, goulash, meat stew, ragout.	1 cup
Salads pasta or potato, potato salad with bacon, macaroni and meat salad.	140 g
Salads—all other meat, salads, ham salad.	100 g
Soups—all varieties	1 cup
Major main entree type sauce, e.g., spaghetti sauce with meat, spaghetti sauce with meatballs.	1/2 cup
Minor main entree sauce, e.g., pizza sauce with meat, gravy.	1/4 cup
Seasoning mixes dry, freeze dry, dehydrated, concentrated soup mixes, bases, extracts, dried broths and stock/juice, freeze dry trail mix product with meat	
As reconstituted: Amount to make one Reference Amount of the final dish e.g., gravy—1/4/cup, major main entree type sauce—1/2 cup, soup—1 cup, entree measurable with a cup—1 cup	

[1] These values represent the amount of food customarily consumed per eating occasion and were primarily derived from the 1977–1978 and the 1987–1988 Nationwide Food Consumption Surveys conducted by the U.S. Department of Agriculture.

[2] Unless otherwise noted in the Reference Amount column, the reference amounts are for the ready-to-serve or almost ready-to-serve form of the product (i.e., heat and serve). If not listed separately, the Reference Amount for the unprepared form (e.g., dehydrated meat dinner) is the amount required to make one Reference Amount of the prepared form.

[3] Manufacturers are required to convert the reference amount to the label serving size in a household measure most appropriate to their specific product using the procedures established by regulation.

[4] Examples listed under Product Category are not all inclusive. Examples are provided to assist manufacturers in identifying appropriate product Reference Amount.

(c) The Reference Amounts set forth in paragraph (b) of this section shall be used to determine whether a product meets the USDA criteria for nutrient content claims such as "Low Calorie." If the serving size declared on the product label differs from the Reference Amount, both the Reference Amount and the serving size declared on the product label shall be used to determine whether the product meets the criteria for a claim.

(d) The Administrator, on his or her own initiative or on behalf of any interested person who has submitted a petition, may issue a proposal to establish or amend a Product Category or Reference Amount identified in paragraph (b) of this section. A petition to establish or amend a Product Category or Reference Amount shall include information as identified in 21 CFR 101.12(h) (1) through (11) and (13).

§ 317.313 Nutrient content claims; general principles.

(a) This section applies to meat products that are intended for human consumption and that are offered for sale, except that nutrient content claims may not be made on products intended specifically for use by infants and toddlers less than 2 years of age.

(b) A claim, which expressly or by implication, characterizes the level of a nutrient (nutrient content claim) of the type required in nutrition labeling pursuant to § 317.309, may not be made on a label or in labeling of that product unless the claim is made in accordance with this Subpart.

(1) An expressed nutrient content claim is any direct statement about the level (or range) of a nutrient in the food, e.g., "low sodium."

(2) An implied nutrient content claim is any claim that describes the product or an ingredient therein in such a manner that leads a consumer to assume that a nutrient is absent or present in a certain amount (e.g., "high in oat bran") or that the food may be useful in selecting foods that are helpful in achieving a total diet that conforms to current dietary recommendations (e.g., "healthy").

(c) Information required or permitted by § 317.309 to be declared in nutrition labeling, and that appears as part of the nutrition label, is not a nutrient content claim and is not subject to the requirements of this section. If such information is declared elsewhere on the label or in labeling, it is a nutrient content claim and is subject to the requirements for nutrient content claims.

(d) An individual product bearing a nutrient content claim shall meet the criteria for that claim on the basis of the reference amount customarily consumed

(RACC) and the amount per labeled serving as specified in § 317.312(b).

(e)(1) A nutrient content claim may state the absence of a nutrient (e.g., Sodium free) if that nutrient is usually present in the product or in product for which the product is a substitute and the substitute food resembles the product for which it substitutes, i.e., is organoleptically, physically and functionally similar (including shelf life) and may be used interchangeably.

(i) If there is a difference in performance characteristics, the product may still be considered a substitute if the label includes a disclaimer adjacent to the most prominent claim as defined in paragraph (j)(2)(ii) of this section, informing the consumer of such difference.

(ii) This disclaimer must be in easily legible print or type and in a size no less than one-half the size of the type of the descriptive term but in no case less than one-sixteenth of an inch in height.

(2) Any claim for the absence of a nutrient in a product that has not been specially processed, altered, formulated or reformulated so as to eliminate the nutrient from the product shall indicate that the product inherently meets the criteria for that descriptor and shall clearly refer to all products of that type and not merely to the particular brand to which the labeling attaches. It shall not bear the descriptive term immediately preceding the name of the product because such terminology would imply that the product has been altered compared to other products of the same type.

(f) A nutrient content claim shall be, in type size and style, no larger than that of the statement of identity.

(g) The label or labeling of a product for which a nutrient content claim is made shall contain prominently and in immediate proximity to such claim the following referral statement: "See _____ for nutrition information" with the blank filled in with the identity of the panel on which nutrition labeling is located.

(1) The referral statement "See [*appropriate panel*] for nutrition information" shall be in easily legible boldface print or type in distinct contrast to other printed or graphic matter and no less than one-half the size of the type of the descriptive term but in no case less than one-sixteenth of an inch in height.

(2) The referral statement shall be immediately adjacent to the descriptive term and may have no intervening material other than the statement of identity. If the descriptive term appears on more than one panel of the label, the referral statement shall be adjacent to the claim on each panel except for the panel that bears the nutrition information.

(3) If a single panel of a label or labeling contains multiple nutrient content claims or a single claim repeated several times, a single referral statement may be made. The statement shall be adjacent to the claim that is printed in the largest type on that panel.

(h) In place of the referral statement described in paragraph (g) of this section, if a product contains more than 11.5 grams of fat, 4.0 grams of saturated fat, 45 milligrams of cholesterol, or 360 milligrams of sodium per reference amount customarily consumed (RACC), labeled serving size or per 100 grams, then that product must disclose, as part of the referral statement, that the nutrient exceeding the specified level is present in the product as follows: "See [*appropriate panel*] for information about [*nutrient requiring disclosure*] and other nutrients"; e.g., "See side panel for information about fats and other nutrients."

(i) The label or labeling of a product may contain a statement about the amount or percentage of a nutrient which implies that the product is high or low in that nutrient if the product actually meets the definition for either "high" or "low" as defined for the nutrient which the label addresses. Such a claim might be "Contains 100 mg of sodium per serving."

(j) Products may bear a statement that compares the level of a nutrient in the product with the level of a nutrient in a reference food. These statements shall be known as "relative claims" and include "reduced", "light", and comparative claims.

(1) To bear a relative claim about the level of a nutrient, the amount of that nutrient in the product must be compared as specified below to a reference food. Such products are:

(i) For all relative claims, an industrywide norm, i.e., a composite value weighted according to a national market share on a unit or tonnage basis of all the products of the same type as the product for which the claim is made, or

(ii) For reduced and comparative claims only, a manufacturer's regular product which has been offered for sale to the public on a regular basis for a substantial period of time in the same geographic area by the same business entity or by one entitled to use its trade name.

(iii) For comparative claims only, a product or class of product whose composition is reported in a current valid data base such as U.S. Department of Agriculture's Handbook 8, *Composition of Foods, Raw, Processed, Prepared.*

(2) For products bearing relative claims:

(i) The label must bear immediately adjacent to such claim in the most prominent location and in type no less than half the size of the type of the claim but no less than one-sixteenth inch, the following accompanying information:

(A) The percentage (or fraction) of the amount of the nutrient in the reference food by which the nutrient has been modified, (e.g., "50% less fat," "⅓ fewer calories"), and

(B) The identity of the reference food, and

(C) Clear and concise quantitative information comparing the amount of the subject nutrient in the product per labeled serving with that of the reference food.

(ii) The most prominent location shall be determined by the following order:

(A) A claim on the principal display panel adjacent to the statement of identity,

(B) A claim elsewhere on the principal display panel,

(C) A claim on the information panel, or

(D) A claim elsewhere on the label.

(iii) Relative claims for decreased levels of nutrients may be made on the label or in labeling of a product only if the nutrient content for that nutrient differs from that of the reference food by more than the amount specified in the definition of "low" for that nutrient.

(k) The term "modified" may be used in the statement of identity of a product that bears a comparative claim in conformance with the requirements of this Subpart, followed immediately by the name of the nutrient whose content has been altered; e.g., "Modified fat ground beef." This statement of identity must be immediately followed by the comparative statement such as "Contains 35% less fat than _____" and all other information required in paragraph (j)(2) of this section for comparative claims.

(l) For purposes of making a claim, a "meal-type product" shall be defined as a product that:

(1) Makes a significant contribution to the diet by:

(i) Providing at least 200 calories per serving (container), or

(ii) Weighing at least 6 ounces per serving (container), and

(2) Contains ingredients from two or more of the following four food groups:

(i) Bread, cereal, rice and pasta group,

(ii) Fruits and vegetables group,

(iii) Milk, yogurt, and cheese group, and

(iv) Meat, poultry, fish, dry beans, eggs, and nuts group.

(3) Is represented as, or is in a form commonly understood to be a breakfast, lunch, dinner, meal, main dish, entree, or pizza. Such representations may be made either by statements, photographs, or vignettes.

(m) [Reserved]

(n) Compliance with requirements for nutrient content claims will be determined using analytical methodology prescribed for determining compliance with nutrition labeling in § 317.309(g) of this subpart.

(o) The following exemptions apply:

(1) Nutrient content claims that have not been defined by regulation and that appear as part of a brand name that was in use prior to November 27, 1991 may continue to be used as part of that brand name, provided they are not false or misleading under section 1(n) of the Act (21 U.S.C. 601(n)(1)).

(2) [Reserved]

(3) A statement that describes the percentage of a vitamin or mineral in the food in relation to a reference daily intake (RDI) as defined in 21 CFR 101.9(c) may be made on the label.

(4) The requirements of this section do not apply to products for special dietary use as described in § 317.2(j)(2).

(5) [Reserved]

(6) Nutrient content claims that were part of the name of a product that was subject to a standard of identity as of November 27, 1991 are not subject to the requirements of paragraphs (b), (g), and (h) of this section whether or not they meet the definition of the descriptive term.

(7) Implied nutrient content claims may be used as part of a brand name, provided that the use of the claim has been authorized by USDA. Petitions requesting approval of such a claim (e.g., healthy) may be submitted pursuant to § 317.369.

§§ 317.314–317.342 [Reserved]

§ 317.343 Significant participation for voluntary nutrition labeling.

(a) In evaluating significant participation for voluntary nutrition labeling, FSIS will consider only the major cuts of single-ingredient, raw meat products, as identified in § 317.344, including those that have been frozen.

(b) FSIS will judge a food retailer to be participating at a significant level if the retailer provides nutrition labeling information for at least 90 percent of the major cuts of single-ingredient, raw meat products, listed in § 317.344, that it sells, and if the nutrition label is consistent in content and format with the mandatory program, or nutrition information is displayed at point-of-purchase in an appropriate manner.

(c) To determine whether there is significant participation by retailers under the voluntary nutrition labeling guidelines, FSIS will select a representative sample of companies allocated by type and size.

(d) FSIS will find that significant participation by food retailers exists if at least 60 percent of all companies that are evaluated are participating in accordance with the guidelines.

(e) FSIS will evaluate significant participation of the voluntary program every 2 years beginning in May 1995.

(1) If significant participation is found, the voluntary nutrition labeling guidelines shall remain in effect.

(2) If significant participation is not found, FSIS shall initiate rulemaking to require nutrition labeling on those products under the voluntary program.

§ 317.344 Identification of the major cuts of meat products.

The major cuts of single-ingredient, raw meat products are: Beef chuck blade roast, beef loin top loin steak, beef rib roast large end, beef round eye round steak, beef round top round steak, beef round tip roast, beef chuck arm pot roast, beef loin sirloin steak, beef round bottom round steak, beef brisket (whole, flat half, or point half), beef rib steak small end, beef loin tenderloin steak, ground beef regular, ground beef extra lean, pork loin chop, pork loin country style ribs, pork loin top loin chop boneless, pork loin rib chop, pork spareribs, pork loin tenderloin, pork loin sirloin roast, pork shoulder blade steak, pork loin top roast boneless, ground pork, lamb shank, lamb shoulder arm chop, lamb shoulder blade chop, lamb rib roast, lamb loin chop, lamb leg (whole, sirloin half, or shank half), veal shoulder arm steak, veal shoulder blade steak, veal rib roast, veal loin chop, and veal cutlets.

§ 317.345 Guidelines for voluntary nutrition labeling of single-ingredient, raw products.

(a) Nutrition information on the cuts of single-ingredient, raw meat products, including those that have been previously frozen, shall be provided in the following manner:

(1) If a retailer chooses to provide nutrition information on the label of these products, these products shall be subject to all requirements of the mandatory nutrition labeling program, except that nutrition labeling may be declared on the basis of either "as consumed" or "as packaged." In addition, the declaration of the number of servings per container need not be included in nutrition labeling of single-ingredient, raw meat products (including ground beef), including those that have been previously frozen.

(2) If a retailer chooses to provide nutrition information at the point-of-purchase by an appropriate means, such as by posting a sign, or by making the information readily available in brochures, notebooks, or leaflet form in close proximity to the food, nutrition information shall be provided as specified in this Subpart for the mandatory nutrition labeling program. The nutrition labeling information may also be supplemented by a video, live demonstration, or other media.

(b) The declaration of nutrition information shall be presented in an abbreviated format as specified in § 317.309(e) of this subpart for the mandatory nutrition labeling program.

(c) The nutrition label data should be based on either raw or cooked edible portions of meat cuts with external cover fat at trim levels reflecting current market practices. If data are based on cooked portions, the methods used to cook the products must be specified and should be those which do not add nutrients from other ingredients such as flour, breading, and salt. Additional nutritional data may be presented on an optional basis for the cooked edible portions of the separable lean of meat cuts.

(d) Nutrient data that are the most current representative data base values contained in USDA's National Nutrient Data Bank or its published form, the Agriculture Handbook No. 8 series, may be used for nutrition labeling of single-ingredient, raw meat products (including ground beef), including those that have been previously frozen. These data may be composite data that reflect different quality grades of beef or other variables affecting nutrient content. Alternatively, data that reflect specific grades or other variables may be used, except that if data are used on labels attached to a product which is labeled as to grade of meat or other variables, the data must represent the product in the package when such data are contained in the representative data base. When data are used on labels attached to a product, the data must represent the edible meat tissues present in the package.

(e) If the nutrition information is in accordance with paragraph (d) of this section, a nutrition label or labeling will not be subject to the Agency compliance review under § 317.309(g), unless a nutrition claim is made on the basis of the representative data base values.

(f) Retailers may use data bases that they believe reflect the nutrient content

of single-ingredient, raw meat products (including ground beef), including those that have been previously frozen; however, such labeling shall be subject to the compliance procedures of paragraph (d) of this section and the requirements specified in this subpart for the mandatory nutrition labeling program.

§§ 317.346–317.353 [Reserved]

§ 317.354 Nutrient content claims for "source" and "high".

(a) *General requirements.* Except as provided in paragraph (e) of this section, the following nutrient content claims about a nutrient in a product in relation to the Reference Daily Intake (RDI) established for that nutrient in 21 CFR 101.9(c)(11)(iv) or Daily Reference Value (DRV) established for that nutrient in 21 CFR 101.9(c)(12)(i), excluding total carbohydrates and unsaturated fatty acids, may be used on the label or in labeling, provided that:

(1) The product is labeled in compliance with § 317.309, and

(2) The nutrient content claim complies with the requirements of § 317.313.

(b) *High.* The term "high" may be used on the label or in labeling of a product:

(1) When the product (except meal-type products as described in § 317.313(l)) contains 20 percent or more of the RDI or the DRV per reference amount customarily consumed (RACC) and per labeled serving, or

(2) If it is a meal-type product as described in § 317.313(l) and it contains per 100 grams of product, an amount of the nutrient that is equal to 20 percent or more of the RDI or DRV.

(c) *Source.* The term "source" may be used on the label or in labeling of a product:

(1) When the product (except meal-type products as described in § 317.313(l)) contains 10 to 19 percent of the RDI or the DRV per reference amount customarily consumed (RACC) and per labeled serving, or

(2) If it is a meal-type product as described in § 317.313(l) and it contains per 100 grams of product, an amount of the nutrient that is equal to 10–19 percent of the RDI or DRV.

(d) *Fiber claim.* If a nutrient content claim is made with respect to the level of dietary fiber, that is, the product is high in fiber or a source of fiber and the product is not low in total fat as defined in § 317.362(b), then the label must disclose the level of total fat as part of the referral statement, e.g., "See [*appropriate panel*] for nutrition information. Contains [*x amount*] of total fat per serving."

(e)(1) *More.* A comparative claim using the term "more" may be used to describe the level of protein, vitamins, minerals, dietary fiber, or potassium in a product, provided that:

(i) The product contains at least 10 percent of the RDI for protein, vitamins, or minerals or of the DRV for dietary fiber, or potassium more than the reference food that it resembles and for which it substitutes; and

(ii) As required in § 317.313(j) for relative claims, the percentage (or fraction) that the nutrient was increased relative to the RDI or DRV; the identity of the reference food; and clear and concise quantitative information comparing the level of the nutrient in the product per labeled serving, with that of the reference food it replaces are declared in immediate proximity to the most prominent such claim.

(2) A comparative claim using the term "more" may be used to describe the level of carbohydrates in a product, provided that the product contains at least 10 percent of the DRV for carbohydrates more than the reference food and the difference between the two products is only complex carbohydrates as defined in 21 CFR 101.9(c)(6)(i). The product must also meet the requirement of subparagraph (e)(1)(ii) of this section.

(3) A comparative claim using the term "more" may be used to describe the level of unsaturated fat in a product, provided that the level of total fat is not increased and the level of trans fatty acids does not exceed 1 percent. The reference food must also meet the requirements of paragraph (e)(1)(ii) of this section.

§ 317.355 [Reserved]

§ 317.356 Nutrient content claims for "light" or "lite".

(a) *General requirements.* The following nutrient content claims using the term "light" or "lite" to describe a product may be used on the label and in labeling, provided that:

(1) The product is labeled in compliance with § 317.309, and

(2) The nutrient content claim complies with the requirements of § 317.313.

(b) The terms "light" or "lite" may be used without further qualification to describe a product, provided that:

(1) The product has at least a one-third (33⅓%) reduction in the number of calories compared to a reference food as specified in § 317.313(j)(1)(i) with a minimum reduction of more than 40 calories per reference amount customarily consumed (RACC) and per labeled serving;

(2) If it derives more than 50 percent of its calories from fat, its fat content is reduced by 50 percent or more compared to the reference food that it resembles or for which it substitutes as specified in § 317.313(j)(1)(i) with a minimum reduction of more than 3 grams per reference amount customarily consumed (RACC) and per labeled serving; and

(3) As required in § 317.313(j) for relative claims, the percent (or fraction) that the calories, and, if appropriate, the fat, were reduced; the identity of the reference food; and clear and concise quantitative information comparing the level of calories and, if appropriate, fat content, in the product per labeled serving, with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim (e.g., "⅓ fewer calories and 50% less fat than our regular Italian sausage: Lite Italian sausage 200 calories, 4 grams fat; regular Italian sausage 300 calories, 8 grams fat per serving.").

(c) A product, other than a salt substitute, that is low, reduced or otherwise altered in sodium content cannot use the term "light" solely because of this alteration but rather must use, as appropriate, the term "reduced sodium" or "low sodium".

(d) The term "light" or "lite" may be used to describe a salt substitute if the sodium content of the product has been reduced by at least 50 percent compared to ordinary table salt.

(e) The term "light" or "lite" may not be used to refer to a product that is not reduced in calories by one-third, and, if applicable, fat by 50 percent unless:

(1) It describes some physical or organoleptic attribute of the product such as texture or color and the qualifying information, so stated, clearly conveys the nature of the product, and

(2) The qualifying information is in the same type size, style, color and prominence as the word "light" and in immediate proximity thereto.

(f) [Reserved]

§§ 317.357–317.359 [Reserved]

§ 317.360 Nutrient content claims for calorie content.

(a) *General requirements.* The following nutrient content claims about the calorie content of a product may be used on the label or in labeling, provided that:

(1) The product is labeled in compliance with § 317.309, and

(2) The nutrient content claims comply with the requirements of § 317.313.

(b) *Calorie content claims.* (1) The terms "calorie free", "free of calories", "no calories", or "zero calories" may be used on the label or in labeling of a product that usually contains or substitutes, as specified in § 317.313(e)(1), for a product that usually contains calories, provided that:

(i) The product contains less than 5 calories per reference amount customarily consumed (RACC) and per labeled serving.

(ii) If a product meets this condition without the benefit of special processing, alteration, formulation or reformulation to lower the caloric content, it is labeled to disclose that calories are not usually present in the product.

(2) The terms "low calorie", "low in calories", or "a low calorie food" may be used on the label or in labeling of products (except meal-type products as described in § 317.313(1)), provided that:

(i) The product does not provide more than 40 calories per reference amount customarily consumed (RACC) and per labeled serving, and

(ii) The product does not provide more than 40 calories per 100 grams or is a sugar substitute.

(iii) If a product meets these conditions without the benefit of special processing, alteration, formulation or reformulation to vary the caloric content, it is labeled to clearly refer to all products of its type and not merely to the particular brand to which the label attaches.

(3) The term "low calorie", "low in calories", or "low calorie meal" may be used on the label or in labeling of meal-type products, provided that the meal contains 105 calories or less per 100 grams of product and meets the requirement of paragraph (b)(2)(iii) of this section.

(4) The terms "reduced calorie", "reduced in calorie", or "calorie reduced" may be used to describe a product (except meal-type products as described in § 317.313(l)), provided that:

(i) The product has been specifically formulated or processed to reduce its calorie content by 33⅓ percent or more, with a minimum reduction of more than 40 calories per reference amount customarily consumed (RACC) and per labeled serving from the reference food that it resembles and for which it substitutes as specified in § 317.313(j)(1) (i) and (ii); and

(ii) As required in § 317.313(j) for relative claims, the percent (or fraction) that the calories were reduced; and the identity of the reference food is declared; and clear and concise quantitative information comparing the level of the nutrient in the product per labeled serving with that of the reference food that it replaces in immediate proximity to the most prominent such claim (e.g., "33⅓ percent fewer calories than regular salami. Calorie content has been reduced from 150 to 100 calories per serving").

(5) A comparative claim using the term "fewer" may be used on the label or in labeling of a product, including meal-type products as defined in § 317.313(l), provided that:

(i) The product contains at least 25 percent fewer calories, with a minimum reduction of more than 40 calories per reference amount customarily consumed (RACC) and per labeled serving, than the reference food that it resembles and for which it substitutes as specified in § 317.313(j)(1) (i), (ii) and (iii); and

(ii) As required in § 317.313(j) for relative claims, the percent (or fraction) that the calories were reduced; the identity of the reference food; and clear and concise quantitative information comparing the level of the calories in the product per labeled serving with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim (e.g., "This Italian sausage contains 25 percent fewer calories than our regular Italian sausage. Calorie content has been lowered from 200 to 150 calories per serving.").

(c) *Use of terms such as "sugars free", "no sugars", or "zero sugars".* (1) Consumers may reasonably be expected to regard terms that represent that the product contains no sugars or sweeteners, e.g., "sugars free" or "no sugars", as indicating a product which is low in calories or significantly reduced in calories. Consequently, except as provided in paragraph (c)(2) of this section, a product may not be labeled with such terms unless:

(i) The product contains less than 0.5 grams of sugars, as defined in 21 CFR 101.9(c)(6)(ii)(A) per reference amount customarily consumed (RACC) and per labeled serving;

(ii) The product contains no added ingredients that are sugars; and

(iii) (A) It is labeled "low calorie" or "reduced calorie" or bears a comparative claim of special dietary usefulness labeled in compliance with paragraph (b) (2), (3), or (4) of this section, or

(B) Such term is immediately accompanied, each time it is used, by the statement "Not a reduced calorie food", "Not a low calorie food", or "Not for weight control."

(2) The terms "no added sugars", "without added sugars", or "no sugars added" may be used, provided:

(i) No amount of sugars as defined in 21 CFR 101.9(c)(6)(ii)(A) is added during processing or packaging;

(ii) The product does not contain ingredients containing added sugars such as jam, jelly, and concentrated fruit juice;

(iii) The sugars or content has not been increased above the amount naturally present in the ingredient(s) by some means such as the use of enzymes;

(iv) The product that it resembles and for which it substitutes normally contains added sugars; and

(v) The product bears a statement indicating that the product is not low calorie or calorie reduced (unless the product meets the requirements for a low or reduced calorie product) and directing consumers' attention to the nutrition panel for further information on sugars and calorie content.

(3) Paragraph (c)(1) of this section shall not apply to a factual statement that a product is unsweetened or contains no added sweeteners in the case of a product that contains apparent substantial inherent sugar content, e.g., juices.

§ 317.361 Nutrient content claims for sodium content.

(a) *General requirements.* The following nutrient content claims about the sodium content of a product may be used on the label and in labeling, provided that:

(1) The product is labeled in compliance with § 317.309; and

(2) The nutrient content claims comply with the requirements of § 317.313.

(b) *Sodium Content claims.* (1) The terms "sodium free", "free of sodium", "no sodium", or "zero sodium" may be used on the label or in labeling of a product that usually contains or substitutes as specified in § 317.313(e)(1) for a product that usually contains sodium, provided that:

(i) The product contains less than 5 milligrams of sodium per reference amount customarily consumed (RACC) and per labeled serving; and

(ii) The product contains no ingredient that is salt (sodium chloride); and

(iii) If a product meets this condition without the benefit of special processing, alteration, formulation or reformulation to lower the sodium content, it is labeled to disclose that sodium is not usually present in the product, e.g., "_____, a sodium free food."

(2) The terms "very low sodium", "very low in sodium", and "a very low sodium food" may be used on the label or in labeling of products (except meal-

type products as described in § 317.313(l)), provided that:

(i) The product does not provide more than 35 milligrams of sodium per reference amount customarily consumed (RACC) and per labeled serving, and

(ii) The product does not provide more than 35 milligrams of sodium per 100 grams.

(iii) If a product meets these conditions without the benefit of special processing, alteration, formulation or reformulation to vary the sodium content, it is labeled to clearly refer to all products of its type and not merely to the particular brand to which the label attaches (e.g., "_____, a very low sodium food").

(3) The term "very low sodium", "very low in sodium", or "very low sodium meal" may be used on the label or in labeling of meal-type products as defined in § 317.313(l), provided that the meal contains 35 milligrams or less of sodium per 100 grams of product and meets the requirement of paragraph (b)(2)(iii) of this section.

(4) The terms "low sodium", "low in sodium", or "a low sodium food" may be used on the label or in labeling of products (except meal-type products as described in § 317.313(l)), provided that:

(i) The product does not provide more than 140 milligrams of sodium per reference amount customarily consumed (RACC) and per labeled serving; and

(ii) The product does not provide more than 140 milligrams of sodium per 100 grams.

(iii) If a product meets these conditions without the benefit of special processing, alteration, formulation or reformulation to vary the sodium content, it is labeled to clearly refer to all products of its type and not merely to the particular brand to which the label attaches (e.g., "_____, a low sodium food").

(5) The term "low sodium", "low in sodium", or "low sodium meal" may be used on the label or in labeling of meal-type products as described in § 317.323(l), provided that the meal contains 140 milligrams or less sodium per 100 grams of product and meets the requirement of paragraph (b)(4)(iii) of this section.

(6) The term "reduced sodium", "reduced in sodium", or "sodium reduced" may be used to describe a product (except meal-type products as discussed in § 317.313(l)), provided that:

(i) The product has been specifically formulated or processed to reduce its sodium content by 50 percent or more with a minimum reduction of more than 140 milligrams per reference amount customarily consumed (RACC) and per labeled serving from the reference food that it resembles and for which it substitutes as specified in § 317.313(j)(1)(i) and (ii); and

(ii) As required in § 317.313(j) for relative claims, the percent (or fraction) that the sodium was reduced; the identity of the reference food; and clear and concise quantitative information comparing the level of the sodium in the product per labeled serving with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim (e.g., "reduced sodium—50 percent less sodium than regular _____. Sodium content has been reduced from 300 to 150 milligrams of sodium per serving.").

(7) A comparative claim using the term "less" may be used on the label or in labeling of a product including meal-type products as described in § 317.313(l), provided that:

(i) The product contains at least 25 percent less sodium with a minimum reduction of more than 140 milligrams per reference amount customarily consumed (RACC) and per labeled serving than the reference food that it resembles and for which it substitutes as specified in § 317.313(j)(1)(i), (ii), and (iii); and

(ii) As required in § 317.313(j) for relative claims, the percent (or fraction) that the sodium was reduced; the identity of the reference food; and clear and concise quantitative information comparing the level of the sodium in the product per labeled serving with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim (e.g., "This chicken noodle soup contains 25% less sodium than our regular chicken noodle soup. Sodium content has been lowered from 300 to 325 milligrams per serving.").

(c) The term "salt" is not synonymous with "sodium." Salt refers to sodium chloride. However, references to salt content such as "unsalted", "no salt", and "no salt added" are potentially misleading.

(1) The term "salt free" may be used on the label or in labeling of products only if the product is "sodium free" as defined in paragraph (b)(1) of this section.

(2) The terms "unsalted", "without added salt", and "no salt added" may be used on the label or in labeling of products, provided:

(i) No salt is added during processing;

(ii) The product that it resembles and for which it substitutes is normally processed with salt; and

(iii) If the product is not sodium free, such claims are immediately accompanied each time they are used, by the statement, "Not a sodium free food" or "Not for control of sodium in the diet."

§ 317.362 Nutrient content claims for fat, fatty acids, and cholesterol content of meat products.

(a) *General requirements.* A claim about the level of fat, fatty acid, and cholesterol in a meat product may only be made on the label and in the labeling of the product if:

(1) The claim uses one of the terms defined in this section in accordance with the definition for that term;

(2) The claim is made in accordance with the general requirements for nutrient content claims in § 317.313; and

(3) The meat product for which the claim is made is labeled in accordance with § 317.309.

(b) *Fat content claims.* (1) The terms "fat free", "free of fat", "no fat", "zero fat", or "nonfat" may be used on the label or in labeling of a meat product, provided that:

(i) The product contains less than 0.5 gram of fat per reference amount customarily consumed and per labeled serving size.

(ii) The product contains no added ingredient that is a fat or oil; and

(iii) As required in § 317.313(e)(2), if the meat product meets these conditions without the benefit of special processing, alteration, formulation, or reformulation to lower fat content, it is labeled to disclose that fat is not usually present in the product.

(2) The terms "low fat" or "low in fat" may be used on the label or in labeling of meat products, except meal-type products as defined in § 317.313(l), provided that:

(i) The product contains 3 grams or less of fat per reference amount customarily consumed, per labeled serving size, and per 100 grams of product; and

(ii) If the product meets these conditions without the benefit of special processing, alteration, formulation, or reformulation to lower fat content, it is labeled to clearly refer to all products of its type and not merely to the particular brand to which the label attaches.

(3) The terms "low fat" or "low in fat" may be used on the label or in labeling of a meal-type product as defined in § 317.313(l), provided that:

(i) The product contains 3 grams or less of fat per 100 grams; and

(ii) If the product meets these conditions without the benefit of special processing, alteration, formulation, or reformulation to lower fat content, it is labeled to clearly refer to all products of its type and not merely to the particular brand to which the label attaches.

(4) The terms "reduced fat", "reduced in fat", or "fat reduced" may be used on the label or in labeling of a product, except meal-type products as defined in § 317.313(l), provided that:

(i) The product has been specifically formulated, altered, or processed to reduce its fat content by 50 percent or more, with a minimum reduction of more than 3 grams per reference amount customarily consumed and per labeled serving size, from the reference food that it resembles and for which it substitutes as defined in § 317.313(j)(2)(i) and (ii); and

(ii) As required in § 317.313(j)(2) for relative claims, the percent (or fraction) that the fat has been reduced, the identity of the reference food, and quantitative information comparing the level of fat in the product per labeled serving size with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim as defined in § 317.313(j)(2)(ii) (e.g., "Reduced fat—50 percent less fat than our regular ground beef. Fat content has been reduced from 28 grams to 14 grams per serving").

(5) A comparative claim using the term "less" may be used on the label or in labeling of a meat product, including meal-type products as defined in § 317.313(l), provided that:

(i) The food contains at least 25 percent less fat, with a minimum reduction of more than 3 grams per reference amount customarily consumed and per labeled serving size, from the reference food that it resembles and for which it substitutes as defined in § 317.313(j)(1)(i), (ii), and (iii): and

(ii) As required in § 317.313(j)(2) for relative claims, the percent (or fraction) that the fat has been reduced, the identity of the reference food, and the quantitative information comparing the level of fat in the product per labeled serving size with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim as defined in § 317.313(j)(2)(ii) (e.g., "This hot dog contains 40 percent less fat than our regular hot dog. Fat content has been lowered from 9 grams to 5.5 grams per serving.").

(6) The term "_____ percent fat free" may be used on the label or in labeling of a meat product, provided that:

(i) The product meets the criteria for "low fat" in paragraph (b)(2) or (b)(3) of this section.

(ii) The label or labeling discloses the amount of total fat per serving (as declared on the label) of the meat product expressed in grams, to the nearest one-half gram. When the total fat content is less than 0.5 grams per serving, the amount may be declared as "0." Such disclosure shall appear in immediate proximity to the most prominent such claim as defined in § 317.313(j)(2)(ii) and in type size that shall be no less than one-half the size of the type used for such claim.

(iii) The percent of reduction and the words "fat free" are in uniform type size.

(iv) A claim for "100 percent fat free" meets all criteria for "fat free" in paragraph (b)(1) of this section.

(c) *Fatty acid content claims.* The label or labeling of meat products that bear claims with respect to the level of saturated fat shall disclose the level of total fat and cholesterol in the product in immediate proximity to such claim each time the claim is made and in type that shall be no less than one-half the size of the type used for the claim with respect to the level of saturated fat. Declaration of cholesterol content may be omitted when the product contains less than 2 milligrams of cholesterol per labeled serving size.

(1) The terms "low in saturated fat" or "low saturated fat" may be used on the label or in labeling of a meat product, except meal-type products as defined in § 317.313(l), provided that:

(i) The product contains 1 gram or less of saturated fatty acids per reference amount customarily consumed and per labeled serving size, not more than 15 percent of calories from saturated fatty acids; and

(ii) If a product meets these conditions without benefit of special processing, alteration, formulation, or reformulation to lower saturated fat content, it is labeled to clearly refer to all foods of its type and not merely to the particular brand to which the label attaches.

(2) The terms "low in saturated fat" or "low saturated fat" may be used on the label or in labeling of a meal-type product, as defined in § 317.313(l), provided that:

(i) The product contains 1 gram or less of saturated fatty acids per 100 grams of product; and

(ii) If the product meets these conditions without the benefit of special processing, alteration, formulation, or reformulation to lower saturated fat content, it is labeled to clearly refer to all products of its type and not merely to the particular brand to which the label attaches.

(3) The terms "reduced saturated fat", "reduced in saturated fat", or "saturated fat reduced" may be used on the label or in labeling of a meat product, except meal-type products as defined in § 317.313(l), provided that:

(i) The product has been specifically formulated, altered, or processed to reduce its saturated fatty acid content by 50 percent or more, with a minimum reduction of more than 1 gram per reference amount customarily consumed and per labeled serving size, from the reference food that it resembles and for which it substitutes as defined in § 317.313(j)(1)(i) and (ii); and

(ii) As required in § 317.313(j)(2) for relative claims, the percent (or fraction) that the saturated fat was reduced, the identity of the reference food, and the quantitative information comparing the level of saturated fat in the product per labeled serving size with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim as defined in § 317.313(j)(2)(ii) (e.g., "Reduced saturated fat. Contains 50 percent less saturated fat than the national average for pork sausage. Saturated fat reduced from 14 g to 7 g per serving").

(4) A comparative claim using the term "less" may be used on the label or in labeling of a meat product, including meal-type products as defined in § 317.313(l), provided that:

(i) The product contains 25 percent less saturated fat with a minimum reduction of more than 1 gram per reference amount customarily consumed and per labeled serving size from the reference food that it resembles and for which it substitutes defined in § 317.313(j)(1)(i), (ii), and (iii); and

(ii) As required in § 317.313(j)(2) for relative claims, the percent (or fraction) that the saturated fat was reduced, the identity of the reference food, and the quantitative information comparing the level of saturated fat in the product per labeled serving size with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim as defined in § 317.313(j)(2)(ii) (e.g., "Brand Y Italian sausage contains 40 percent less saturated fat than our regular Brand X Italian sausage. Brand Y contains 6 grams saturated fat; Brand X contains 10 grams saturated fat.").

(d) *Cholesterol content claims.* (1) The terms "cholesterol free", "free of cholesterol", "zero cholesterol", or "no cholesterol" may be used on the label or in labeling of a meat product, provided that:

(i) For products that contain 11.5 grams or less of total fat per reference amount customarily consumed, per labeled serving size, and per 100 grams of product:

(A) The product contains less than 2 milligrams of cholesterol per reference

amount customarily consumed and per labeled serving size;

(B) The product contains 2 grams or less of saturated fat per reference amount customarily consumed and per labeled serving size;

(C) As required in § 317.313(e), if the product contains less than 2 milligrams of cholesterol per reference amount customarily consumed and per labeled serving size without the benefit of special processing, alteration, formulation or reformulation to lower cholesterol content, it is labeled to disclose that cholesterol is not usually present in the product.

(ii) For products that contain more than 11.5 grams of total fat per reference amount customarily consumed, per labeled serving size, or per 100 grams of product:

(A) The product contains less than 2 milligrams of cholesterol per reference amount customarily consumed and per labeled serving size;

(B) The product contains 2 grams or less of saturated fat per reference amount customarily consumed and per labeled serving size.

(C) The label or labeling discloses the level of total fat in a serving (as declared on the label) of the product. Such disclosure shall appear in immediate proximity to such claim preceding the referral statement required in § 317.313(g) in type that shall be no less than one-half the size of the type used for such claim. If the claim appears on more than one panel, the disclosure shall be made on each panel except for the panel that bears nutrition labeling. If the claim appears more than once on a panel, the disclosure shall be made in immediate proximity to the claim that is printed in the largest type; and

(D) As required in § 317.313(e)(2), if the meat product contains less than 2 milligrams of cholesterol per reference amount customarily consumed and per labeled serving size without the benefit of special processing, alteration, formulation, or reformulation to lower cholesterol content, it is labeled to disclose that cholesterol is not usually present in the product, or

(E) If the product contains less than 2 milligrams of cholesterol per reference amount customarily consumed and per labeled serving size only as a result of special processing, alteration, formulation, or reformulation, the amount of cholesterol is substantially less (i.e., meet requirements of paragraph (d)(5)(i)(A) of this section) than the product for which it substitutes as specified in § 317.313(d) that has a significant (i.e., 5 percent or more) market share. As required in § 317.313(j)(2) for relative claims, the percent (or fraction) that the cholesterol was reduced, the identity of the reference food, and the quantitative information comparing the level of cholesterol in the product per labeled serving size with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim as defined in § 317.313(j)(2)(ii).

(2) The terms "low in cholesterol" or "low cholesterol" may be used on the label or in labeling of a meat product, except meal-type products as defined in § 317.313(l), provided that:

(i) For products that contain 11.5 grams or less of total fat, per reference amount customarily consumed, per labeled serving size, and per 100 grams of product:

(A) The product contains 20 milligrams or less of cholesterol per reference amount customarily consumed, per labeled serving size, and per 100 grams of product;

(B) The product contains 2 grams or less of saturated fatty acids per reference amount customarily consumed and per labeled serving size;

(C) As required in § 317.313(e), if the product contains 20 milligrams or less of cholesterol per reference amount customarily consumed, per labeled serving size, and per 100 grams of product without the benefit of special processing, alteration, formulation or reformulation to lower cholesterol content, it is labeled to clearly refer to all products of that type and not merely to the particular brand to which the label attaches.

(ii) For products that contain more than 11.5 grams of total fat per reference amount customarily consumed, per labeled serving size, or per 100 grams of product:

(A) The product contains 20 milligrams or less of cholesterol per reference amount customarily consumed, per labeled serving size, and per 100 grams of product;

(B) The product contains 2 grams or less of saturated fatty acids per reference amount customarily consumed and per labeled serving size; and

(C) The label or labeling discloses the level of total fat in a serving (as declared on the label) of the product. Such disclosure shall appear in immediate proximity to such claim preceding the referral statement required in § 317.313(g) in type that shall be no less than one-half the size of the type used for such claim. If the claim appears on more than one panel, the disclosure shall be made on each panel except for the panel that bears nutrition labeling. If the claim is made more than once on a panel, the disclosure shall be made in immediate proximity to the claim that is printed in the largest type; and

(D) As required in § 317.313(e)(2), the product contains 20 milligrams or less of cholesterol per reference amount customarily consumed, per labeled serving size, and per 100 grams of product without the benefit of special processing, alteration, formulation or reformulation to lower cholesterol content, it is labeled to clearly refer to all products of that type and not merely to the particular brand to which the label attaches, or

(E) If the product contains 20 milligrams or less of cholesterol only as a result of special processing, alteration, formulation, or reformulation, the amount of cholesterol is substantially less (i.e., meets requirements of paragraph (d)(5)(i)(A) of this section) than the food for which it substitutes as specified in § 317.313(d) that has a significant (i.e., 5 percent or more) market share. As required in § 317.313(j)(2) for relative claims, the percent (or fraction) that the cholesterol has been reduced, the identity of the reference food, and the quantitative information comparing the level of cholesterol in the product per labeled serving size with that of the reference food are declared in immediate proximity to the most prominent such claim as defined in § 317.313(j)(2)(ii).

(3) The terms "low in cholesterol" or "low cholesterol" may be used on the label or in labeling of a meal-type product as defined in § 317.313, provided that the product meets the requirements of paragraph (d)(2) of this section, except that the determination as to whether paragraph (d)(2) (i) or (ii) of this section applies to the product will be made only on the basis of whether the product contains 11.5 grams or less of fat per 100 grams of product, the requirement in paragraphs (d)(2) (i)(A) and (ii)(A) of this section shall be limited to 20 milligrams of cholesterol per 100 grams, and the requirement in paragraphs (d)(2) (i)(B) and (ii)(B) of this section shall be modified to require that the product contain 2 grams or less of saturated fat per 100 grams rather than per reference amount customarily consumed and per labeled serving size.

(4) The terms "reduced cholesterol", "reduced in cholesterol", or "cholesterol reduced" may be used on the label or in labeling of a meat product or a product that substitutes for that food as specified in § 317.313(d), except meal-type products as defined in § 317.313(l), provided that:

(i) For products that contain 11.5 grams or less of total fat per reference amount customarily consumed, per labeled serving size, and per 100 grams:

(A) The product has been specifically formulated, altered, or processed to reduce its cholesterol content by 50 percent or more, with a minimum reduction of more than 20 milligrams per reference amount customarily consumed and per labeled serving size, from the reference food that it resembles and for which it substitutes as defined in § 317.313(j)(1) (i) and (ii);

(B) The product contains 2 grams or less of saturated fatty acids per reference amount customarily consumed and per labeled serving size; and

(C) As required in § 317.313(j)(2) for relative claims, the percent that the cholesterol has been reduced, the identity of the reference food, and the quantitative information comparing the level of cholesterol in the product per labeled serving size with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim as defined in § 317.313(j)(2)(ii).

(ii) For products that contain more than 11.5 grams of total fat per reference amount customarily consumed, per labeled serving size, or per 100 grams of product:

(A) The product has been specifically formulated, altered, or processed to reduce its cholesterol content by 50 percent or more, with a minimum reduction of more than 20 milligrams per reference amount customarily consumed and per labeled serving size, from the reference food (as defined in § 317.313(j)(1) (i) and (ii)) that it resembles and for which it substitutes as specified in § 317.313(d) that has a significant (i.e., 5 percent or more) market share;

(B) The product contains 2 grams or less of saturated fatty acids per reference amount customarily consumed and per labeled serving size; and

(C) The label or labeling discloses the level of total fat in a serving (as declared on the label) of the product. Such disclosure shall appear in immediate proximity to such claim preceding the referral statement required in § 317.313(g) in type that shall be no less than one-half the size of the type used for such claim. If the claim appears on more than one panel, the disclosure shall be made on each panel except for the panel that bears nutrition labeling. If the claim is made more than once on a panel, the disclosure shall be made in immediate proximity to the claim that is printed in the largest type; and

(D) As required in § 317.313(j)(2) for relative claims, the percent (or fraction) that the cholesterol has been reduced, the identity of the reference food, and the quantitative information comparing the level of cholesterol in the product per labeled serving size with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim as defined in § 317.313(j)(2)(ii).

(5) A comparative claim using the term "less" may be used on the label or in labeling of a product or a product that substitutes for that product as specified in § 317.313(d), including meal-type products as defined in § 317.313(l), provided that:

(i) For products that contain 11.5 grams or less of total fat, per reference amount customarily consumed, per labeled serving size, and per 100 grams:

(A) The product contains at least 25 percent less cholesterol, with a minimum reduction of more than 20 milligrams per reference amount customarily consumed and per labeled serving size, from the reference food that it resembles and for which it substitutes as defined in § 317.313(j)(1) (i), (ii), and (iii);

(B) The product contains 2 grams or less of saturated fatty acids per reference amount customarily consumed and per labeled serving size; and

(C) As required in § 317.313(j)(2) for relative claims, the percent that the cholesterol was reduced, the identity of the reference food, and the quantitative information comparing the level of cholesterol in the product per labeled serving size with that of the reference food are declared in immediate proximity to the most prominent such claim as defined in § 317.313(j)(2)(ii).

(ii) For products that contain more than 11.5 grams of total fat per reference amount customarily consumed, per labeled serving size, or per 100 grams of product:

(A) The product contains at least 25 percent less cholesterol with a minimum reduction of 20 milligrams per reference amount customarily consumed and per labeled serving size, from the reference food as defined in § 317.313(j)(1)(i), (ii), and (iii) that it resembles and for which it substitutes as specified in § 317.313(d) that has a significant (i.e., 5 percent or more) market share;

(B) The product contains 2 grams or less of saturated fatty acids per reference amount customarily consumed and per labeled serving size; and

(C) The label or labeling discloses the level of total fat in a serving (as declared on the label) of the product. Such disclosure shall appear each time the claim is made, in immediate proximity to such claim preceding the referral statement required in § 317.313(g) in type that shall be no less than one-half the size of the type used for such claim. If the claim appears on more than one panel, the disclosure shall be made on each panel except for the panel that bears nutrition labeling. If the claim is made more than once on a panel, the disclosure shall be made in immediate proximity to the claim that is printed in the largest type; and

(D) As required in § 317.313(j)(2) for relative claims, the percent (or fraction) that the cholesterol was reduced, the identity of the reference food, and the quantitative information comparing the level of cholesterol in the product per labeled serving size with that of the reference food it replaces are declared in immediate proximity to the most prominent such claim as defined in § 317.313(j)(2)(ii) (e.g., "This ham omelette contains 30 percent less cholesterol than our regular omelette. Cholesterol lowered from 45 milligrams to 30 milligrams per serving. Contains 12 grams of fat per serving.").

§§ 317.363–317.368 [Reserved]

(e) *Lean and Extra Lean Claims.* (1) The term "lean" may be used on the label or in labeling of a meat product, provided that the product contains less than 10.5 grams fat, less than 3.5 grams saturated fat, and less than 94.5 milligrams cholesterol per 100 grams.

(2) The term "extra lean" may be used on the label or in labeling of a meat product, provided that the product contains less than 4.9 grams fat; less than 1.8 grams saturated fat; and less than 94.5 milligrams cholesterol per 100 grams.

§ 317.369 Petitions for nutrient content claims.

(a) This section pertains to petitions for claims, expressed or implied, that characterize the level of any nutrient required to be on the label or in labeling of product by this subpart.

(b) Petitions included in this section are (1) petitions for a new (heretofore unauthorized) nutrient content claim,

(2) petitions for a synonymous term (i.e., one that is consistent with a term defined by regulation) for characterizing the level of a nutrient, and (3) petitions for the use of an implied claim in a brand name.

(c) Petitions to be filed under this section shall be submitted in quadruplicate. If any part of the material submitted is in a foreign language, it shall be accompanied by an accurate and complete English translation. The

petition shall state the petitioner's post office address.

(d) Pertinent information may be incorporated in, and will be considered as part of, a petition on the basis of specific reference to such information submitted to and retained in the files of the Food Safety and Inspection Service. However, any reference to unpublished information furnished by a person other than the applicant will not be considered unless use of such information is authorized (with the understanding that such information may in whole or part be subject to release to the public) in a written statement signed by the person who submitted it. Any reference to published information should be accompanied by reprints or photostatic copies of such references.

(e) If nonclinical laboratory studies are included in a petition, the petition shall include, with respect to each nonclinical study contained in the petition, either a statement that the study has been, or will be, conducted in compliance with the good laboratory practice regulations as set forth in part 58 of chapter I, title 21, or, if any such study was not conducted in compliance with such regulations, a brief statement of the reason for the noncompliance.

(f) If clinical investigations are included, the petition shall include statements regarding each such clinical investigation relied upon in the petition that it either was conducted in compliance with the requirements for institutional review set forth in part 56 of chapter I, title 21, or was not subject to such requirements in accordance with § 56.194 or § 56.105, and that it was conducted in compliance with the requirements for informed consents set forth in part 50 of chapter I, title 21.

(g) The availability for public disclosure of petitions submitted to the Agency under this section will be governed by the rules specified in subchapter D, title 9.

(h) The data specified under the several lettered headings should be submitted on separate sheets or sets of sheets, suitably identified. If such data have already been submitted with an earlier application from the petitioner, the present petition must provide the data.

(i) The petition must be signed by the petitioner or by his or her attorney or agent, or (if a corporation) by an authorized official.

(j) The petition shall include a statement signed by the person responsible for the petition, that to the best of his or her knowledge, it is a representative and balanced submission that includes unfavorable information, as well as favorable information, known to him or her pertinent to the evaluation of the petition.

(k)(1) Petitions for a new nutrient content claim shall include the following data and be submitted in the following form.

(Date)

Name of petitioner _____

Post-office address _____

Subject of the petition _____

FSIS Hearing Clerk, Regulations Development Unit, Policy Office, Food Safety and Inspection Service, *U.S. Department of Agriculture, Washington DC 20250.*

Dear Sirs: The undersigned, _____ submits this petition pursuant to 9 CFR 317.369 with respect to (statement of the claim and its proposed use).

Attached hereto, in quadruplicate, and constituting a part of this petition, are the following:

A. A statement identifying the descriptive term and the nutrient that the term is intended to characterize with respect to the level of such nutrient. The statement should address why the use of the term as proposed will not be misleading. The statement should provide examples of the nutrient content claim as it will be used on labels or labeling, as well as the types of products on which the claim will be used. The statement shall also specify the level at which the nutrient must be present or what other conditions concerning the product must be met for the appropriate use of the term in labels or labeling, as well as any factors that would make the use of the term inappropriate.

B. A detailed explanation supported by any necessary data, of why use of the food component characterized by the claim is of importance in human nutrition by virtue of its presence or absence at the levels that such claim would describe. This explanation shall also state what nutritional benefit to the public will derive from use of the claim as proposed and why such benefit is not available through the use of existing terms defined by regulation. If the claim is intended for a specific group within the population, the analysis should specifically address nutritional needs of such group, and should include scientific data sufficient for such purpose. The petition should also include data and information, e.g., surveys to the extent necessary to demonstrate that consumers can be expected to understand the meaning of the term under the proposed conditions of use.

C. Analytical data that demonstrates the amount of the nutrient that is the subject of the claim, that is present in the products for which the claim is intended. The assays should be performed on representative samples using the Association of Official Analytical Chemists (AOAC) methods where available. If no AOAC method is available, the petitioner shall submit the assay method used, and data establishing the validity of the method for assaying the nutrient in the particular food. The validation data should include a statistical analysis of the analytical and product variability.

D. A detailed analysis of the potential effect of the use of the proposed claim on food consumption, and any corresponding changes in nutrient intake. The latter item should specifically address the intake of nutrients that have beneficial and negative consequences in the total diet. If the claim is intended for a specific group within the population, the above analysis should specifically address the dietary practices of such group, and should include data sufficient to demonstrate that the dietary analysis is representative of such group.

Yours very truly,

Petitioner _____

By _____

(Indicate authority)

(2) Within 15 days of receipt of the petition, the petitioner will be notified by letter of the date on which the petition was received. Such notice will inform the petitioner (i) that the petition is undergoing Agency review and the petitioner will subsequently be notified of the Agency's decision to file or deny the petition; or (ii) that the petition is incomplete, e.g., one that lacks any of the data required by this section, one that states such data in a manner that is not readily understood, or one that has not been submitted in quadruplicate, in which case the petition will be denied and the petitioner will be notified as to what respect the petition is incomplete.

(3) Within 100 days of the date of receipt of the petition, the Administrator will notify the petitioner by letter that the petition has either been filed or denied. If denied, the notification shall state the reasons therefor. If filed, the date of the notification letter becomes the date of filing. A petition that has been denied shall not be made available to the public. A filed petition shall be available to the public as provided under paragraph (e) of this section.

(4) Within 90 days of the date of filing, the Administrator will, by letter of notification to the petitioner, (i) deny the petition, or (ii) inform the petitioner that a proposed regulation to provide for the requested use of the new term will be published in the **Federal Register**. The Administrator will publish the proposal to amend the regulations to provide for the requested use of the nutrient content claim in the **Federal Register** within 90 days of the date of filing. The proposal will also announce the availability of the petition for public disclosure.

(l)(1) Petitions for a synonymous term shall include the following data and be submitted in the following form.

(Date)

Name of petitioner _____

Post-office address _____

Subject of the petition _____

FSIS Hearing Clerk, Regulations Development Unit, Policy Office, Food Safety and Inspection Service,
U.S. Department of Agriculture, Washington DC 20250.

Dear Sirs: The undersigned, _____ submits this petition pursuant to 9 CFR 317.369 with respect to (statement of the synonymous term and its proposed use in a nutrient content claim that is consistent with an existing term that has been defined under subpart B of part 317).

Attached hereto, in quadruplicate, and constituting a part of this petition, are the following:

A. A statement identifying the synonymous descriptive term, the existing term defined by a regulation with which the synonymous term is claimed to be consistent, and the nutrient that the term is intended to characterize the level of. The statement should address why the use of the synonymous term as proposed will not be misleading. The statement should provide examples of the nutrient content claim as it will be used on labels or labeling, as well as the types of products on which the claim will be used. The statement shall also specify whether any limitations not applicable to the use of the defined term are intended to apply to the use of the synonymous term.

B. A detailed explanation supported by any necessary data, of why use of the proposed term is requested, including whether the existing defined term is inadequate for the purpose of effectively characterizing the level of a nutrient. This item shall also state what nutritional benefit to the public will derive from use of the claim as proposed, and why such benefit is not available through the use of existing term defined by regulation. If the claim is intended for a specific group within the population, the analysis should specifically address nutritional needs of such group, and should include scientific data sufficient for such purpose. This item shall also include data and information, e.g., surveys, to the extent necessary to demonstrate that consumers can be expected to understand the meaning of the term under the proposed conditions of use.

C. A detailed analysis of the potential effect of the use of the proposed claim on food consumption and any corresponding changes in nutrient intake. The latter item should specifically address the intake of nutrients that have beneficial and negative consequences in the total diet. If the claim is intended for a specific group within the population, the above analysis should specifically address the dietary practices of such group, and should include data sufficient to demonstrate that the dietary analysis is representative of such group.

Yours very truly,
Petitioner _____
By _____
(Indicate authority)

(2) Within 15 days of receipt of the petition, the petitioner will be notified by letter of the date on which the petition was received. Such notice will inform the petitioner (i) that the petition is undergoing Agency review and the petitioner will subsequently be notified of the Agency's decision to grant the petitioner permission to use the proposed term or to deny the petition; or (ii) that the petition is incomplete, e.g., one that lacks any of the data required by this part, one that states such data in a manner that is not readily understood, or one that has not been submitted in quadruplicate, in which case the petition will be denied and the petitioner will be notified as to what respect the petition is incomplete.

(3) Within 90 days of the date of receipt of the petition that is accepted for review (i.e., that has not been found to be incomplete and subsequently denied), the Administrator will notify the petitioner by letter of the Agency's decision to grant the petitioner permission to use the proposed term, with any conditions or limitations on such use specified, or to deny the petition, in which case the letter shall state the reasons therefor. Failure of the petition to fully address the requirements of this section shall be grounds for denial of the petition.

(4) As soon as practicable following the granting of a petition, the Administrator will publish a notice in the **Federal Register** informing the public of his or her decision. If the petition is granted, the approved synonymous term will be included in the regulations listing terms permitted for use in nutrient content claims.

(m)(1) Petitions for the use of an implied nutrient content claim in a brand name shall include the following data and be submitted in the following form.

_____
(Date)
Name of petitioner _____
Post-office address _____
Subject of the petition _____

FSIS Hearing Clerk, Regulations Development Unit, Policy Office, Food Safety and Inspection Service,
U.S. Department of Agriculture, Washington DC 20250.

Dear Sirs: The undersigned, _____ submits this petition pursuant to 9 CFR 317.369 with respect to (statement of the implied nutrient content claim and its proposed use in a brand name).

Attached hereto, in quadruplicate, and constituting a part of this petition, are the following:

A. A statement identifying the implied nutrient content claim, the nutrient the claim is intended to characterize, the corresponding term for characterizing the level of such nutrient as defined by a regulation, and the brand name of which the implied claim is intended to be a part. The statement should address why the use of the brand-name as proposed will not be misleading. The statement should provide examples of the types of products on which the brand name will appear. It should also include data showing that the actual level of the nutrient in the food would qualify the label of the product to bear the corresponding term defined by regulation. Assay methods used to determine the level of a nutrient should meet the requirements stated under petition format item C in paragraph (k)(1) of this section.

B. A detailed explanation supported by any necessary data, of why use of the proposed brand name is requested. This item shall also state what nutritional benefit to the public will derive from use of the brand name as proposed. If the branded product is intended for a specific group within the population, the analysis should specifically address nutritional needs of such group, and should include scientific data sufficient for such purpose.

C. A detailed analysis of the potential effect of the use of the proposed brand name on food consumption, and any corresponding changes in nutrient intake. The latter item should specifically address the effect on the intake of nutrients that have beneficial and negative consequences in the total diet. If the branded product is intended for a specific group within the population, the analysis should specifically address the dietary practices of such group, and should include data sufficient to demonstrate that the dietary analysis is representative of such group.

Yours very truly,
Petitioner _____
By _____

(2) Within 15 days of receipt of the petition, the petitioner will be notified by letter of the date on which the petition was received. Such notice will inform the petitioner (i) that the petition is undergoing Agency review or (ii) that the petition is incomplete, i.e., one that lacks any of the data required by this part, one that states such data in a manner that is not readily understood, or one that has not been submitted in quadruplicate, in which case the petition will be denied and the petitioner will be notified as to what respect the petition is incomplete.

(3) The Administrator will publish a notice of the petition in the **Federal Register** announcing its availability to the public and seeking comment on the petition. The petition shall be available to the public to the extent provided under paragraph (e) of this section. The notice shall allow 30 days for comments.

(4) Within 100 days of the date of receipt of the petition that is accepted for review (i.e., that has not been found to be incomplete and subsequently denied), the Administrator will (i) notify the petitioner by letter of the Agency's decision to grant the petitioner permission to use the proposed brand name if such use is not misleading, with any conditions or limitations on such use specified, or (ii) deny the petition, in which case the letter shall state the reasons therefor. Failure of the petition

to fully address the requirements of this section shall be grounds for denial of the petition. Should the Administrator not notify the petitioner of his or her decision on the petition within 100 days, the petition shall be considered to be granted.

(5) As soon as practicable following the granting of a petition, the Administrator will publish a notice in the **Federal Register** informing the public of such fact.

§§ 317.370–317.379 [Reserved]

§ 317.380 Label statements relating to usefulness in reducing or maintaining body weight.

(a) *General requirements.* Any product that purports to be or is represented for special dietary use because of usefulness in reducing body weight shall bear:

(1) Nutrition labeling in conformity with § 317.309 of this subpart, unless exempt under that section, and

(2) A conspicuous statement of the basis upon which the product claims to be of special dietary usefulness.

(b) *Nonnutritive ingredients.* (1) Any product subject to paragraph (a) of this section that achieves its special dietary usefulness by use of a nonnutritive ingredient (i.e., one not utilized in normal metabolism) shall bear on its label a statement that it contains a nonnutritive ingredient and the percentage by weight of the nonnutritive ingredient.

(2) A special dietary product may contain a nonnutritive sweetener or other ingredient only if the ingredient is safe for use in the product under the applicable law and regulations of this chapter. Any product that achieves its special dietary usefulness in reducing or maintaining body weight through the use of a nonnutritive sweetener shall bear on its label the statement required by paragraph (b)(1) of this section, but need not state the percentage by weight of the nonnutritive sweetener. If a nutritive sweetener(s) as well as nonnutritive sweetener(s) is added, the statement shall indicate the presence of both types of sweetener, e.g., "Sweetened with nutritive sweetener(s) and nonnutritive sweetener(s)."

(c) *"Low calorie" foods.* A product purporting to be "low calorie" must comply with the criteria set forth for such foods in § 317.360(b) (2) and (3).

(d) *"Reduced calorie" foods and other comparative claims.* A product purporting to be "reduced calorie" or otherwise containing fewer calories than a reference food must comply with the criteria set forth for such foods in § 317.360(b) (4) and (5).

§§ 317.381–317.399 [Reserved]

§ 317.400 Exemption from nutrition labeling.

Meat products used for further processing, such as sliced pepperoni that will be used in pizza, shall be exempt from nutrition labeling, provided that the labels for these products bear no nutrition claims or nutrition information.

PART 320—RECORDS, REGISTRATION, AND REPORTS

3. The authority citation for part 320 would continue to read as follows:

Authority: 21 U.S.C. 601–695; 7 CFR 2.17, 2.55.

4. Section 320.1 would be amended by adding a new paragraph (b)(7) to read as follows:

§ 320.1 Records required to be kept.

* * * * *

(b) * * *

(7) Records of nutrition labeling as required by subpart B, part 317, of this subchapter.

PART 381—POULTRY PRODUCTS INSPECTION REGULATIONS

5. The authority citation for part 381 would continue to read as follows:

Authority: 7 U.S.C. 450, 21 U.S.C. 451–470, 7 CFR 2.17, 2.55.

6. Section 381.175 would be amended by adding a new paragraph (b)(4) to read as follows:

§ 381.175 Records required to be kept.

* * * * *

(b) * * *

(4) Records of nutrition labeling as required by subpart Y of this part.

7. Part 381 would be amended by adding a new subpart Y to read as follows:

Subpart Y—Nutrition Labeling

Sec.

381.400 Nutrition labeling of poultry products.
381.401 [Reserved]
381.402 Location of nutrition information.
381.403–381.407 [Reserved]
381.408 Labeling of poultry products with number of servings.
381.409 Nutrition label content.
381.410 [Reserved]
381.411 [Reserved]
381.412 Reference amounts customarily consumed per eating occasion.
381.413 Nutrient content claims; general principles.
381.414–381.442 [Reserved]
381.443 Significant participation for voluntary nutrition labeling.
381.444 Identification of the major cuts of poultry products.
381.445 Guidelines for voluntary nutrition labeling of single-ingredient, raw products.
381.446–381.453 [Reserved]
381.454 Nutrient content claims for "source" and "high".
381.455 [Reserved]
381.456 Nutrient content claims for "light" or "lite".
381.457–381.459 [Reserved]
381.460 Nutrient content claims for calorie content.
381.461 Nutrient content claims for sodium content.
381.462 Nutrient content claims for fat, fatty acids, and cholesterol content of poultry products.
381.463–381.468 [Reserved]
381.469 Petitions for nutrient content claims.
381.470–381.479 [Reserved]
381.480 Label statements relating to usefulness in reducing or maintaining body weight.
381.481–381.499 [Reserved]
381.500 Exemption from nutrition labeling.

Subpart Y—Nutrition Labeling

§ 381.400 Nutrition labeling of poultry products.

(a) Nutrition labeling shall be provided for all poultry products, except single-ingredient, raw products, in accordance with the requirements of § 381.409, unless the product is used for further processing as provided in § 381.500 of this subpart.

(b) Nutrition labeling may be provided for single-ingredient, raw poultry products in accordance with the requirements of §§ 381.409 and 381.445. Significant participation in voluntary nutrition labeling shall be measured by the Agency in accordance with §§ 381.443 and 381.444 of this subpart.

§ 381.401 [Reserved]

§ 381.402 Location of nutrition information.

(a) Nutrition information on a label of packaged poultry products shall appear on the label's principal display panel or on the information panel, except as provided in paragraph (b) of this section.

(b) Nutrition labeling information for individually wrapped packages of poultry products of less than ½ ounce net weight and products packaged in other than consumer-size packages may be shown at a location other than on the product label, provided that the labels for these products bear no nutrition claims. In lieu of on the product label, nutrition information may be displayed as follows:

(1) Product label inserts, and

(2) Point of purchase information supplied by the manufacturer.

§§ 381.403–381.407 [Reserved]

§ 381.408 Labeling of poultry products with number of servings.

The label of any package of a poultry product that bears a representation as to the number of servings contained in such package shall meet the requirements of § 381.121(c)(7).

§ 381.409 Nutrition label content.

(a) (1) All nutrient and product component quantities shall be declared in relation to a serving or, where the product is customarily not consumed directly, to a portion, as defined in 21 CFR 101.9(b) (1) through (3) and 21 CFR 101.9(b) (5) through (8).

(2) The declaration of nutrient and product component content shall be on the basis of the product "as packaged" for all products, except that single-ingredient, raw products may be declared on the basis of the product "as consumed" as set forth in § 381.445(a)(1). In addition to the required declaration on the basis of "as packaged" for products other than single-ingredient, raw products, the declaration may also be made on the basis of "as consumed."

(3) Another column of figures may be used to declare the nutrient and product component information on the basis of 100 grams or 100 milliliters of the product. This information shall be shown as required in paragraph (a)(2) of this section.

(b) The declaration of nutrition information on the label shall contain the following information, except for that which is identified as "VOLUNTARY" or for those poultry products where an abbreviated format must be used as provided for in paragraph (e) of this section. Information shall be presented in the following order, using the headings, specified and displayed with equal type size under the overall heading of "NUTRITION INFORMATION PER SERVING (PORTION)." Alternatively, the terms "PER SERVING (PORTION)" may be placed directly below the terms "NUTRITION INFORMATION." Definitions, units of measure, increments for declaring values, and methods of calculation shall be in accordance with 21 CFR 101.9(c) (1) through (10).

(1) "Serving (portion) size",

(2) "Servings (portions) per container",

(3) "Caloric content" or "Calories",

(i) "Calories from total fat",

(ii) "Calories from saturated fat", "Calories from unsaturated fat", "Calories from total carbohydrate", and "Calories from protein" (VOLUNTARY),

(A) "Calories from saturated fat" or "Calories from saturated",

(B) "Calories from unsaturated fat" or "Calories from unsaturated",

(C) "Calories from total carbohydrate",

(D) "Calories from protein",

(4) "Total fat content" or "Total fat",

(i) "Saturated fat content", "Saturated fat", or "Saturated",

(ii) "Unsaturated fat content", "Unsaturated fat", or "Unsaturated" (VOLUNTARY),

(A) "Polyunsaturated fat" or "Polyunsaturated",

(B) "Monounsaturated fat" or "Monounsaturated",

(5) "Cholesterol content" or "Cholesterol",

(6) "Total carbohydrate content" or "Total carbohydrate",

(i) "Complex carbohydrate content" or "Complex carbohydrate",

(ii)(A) "Sugars content" or "Sugars",

(B) "Sugar alcohol content" or "Sugar alcohol" (VOLUNTARY),

(7) "Dietary fiber content" or "Dietary fiber",

(i) "Soluble and insoluble fiber" (VOLUNTARY),

(A) "Soluble fiber",

(B) "Insoluble fiber",

(ii) "Total dietary fiber", "soluble dietary fiber", and "insoluble dietary fiber content",

(8) "Protein content" or "Protein",

(i) A statement of the corrected amount of protein per serving calculated as a percentage of the Reference Daily Intake (RDI) for protein and expressed as "Percent of Daily Value",

(ii) The "Corrected amount of protein (gram) per serving (portion)", and

(iii) For the purpose of labeling with a percent of the RDI, a value of 50 grams of protein shall be the RDI for adults and children 4 or more years of age, 16 grams of protein for children less than 4 years of age, and 14 grams of protein for infants.

(9) "Sodium content" or "Sodium",

(10) "Potassium content" or "Potassium" (VOLUNTARY),

(11) Under the heading "Percent of Daily Value": A statement of the amount per serving (portion) of the vitamins and minerals expressed as a percent of the RDI, in accordance with 21 CFR 101.9(c)(11), and

(12) "Nutrition Profile" in accordance with 21 CFR 101.9(c)(12).

(c) [Reserved]

(d)(1) If a product consists of assortments of poultry products (e.g., variety packs) in the same package, nutrient content shall be expressed on the entire package contents or on each individual product.

(2) If a product is commonly combined with other ingredients or is cooked or otherwise prepared before eating, and directions for such combination or preparations are provided, another column of figures may be used to declare the nutrient contents on the basis of the product as consumed for the product alone (e.g., a cream soup mix may be labeled with one set of Daily Values for the dry mix (per serving), and another set for the serving of the final soup when prepared (e.g., per serving of cream soup mix and 1 cup of vitamin D fortified whole milk)): *Provided*, That the type and quantity of the other ingredients to be added to the product by the user and the specific method of cooking and other preparation shall be specified prominently on the label.

(e) The abbreviated format shall be in accordance with 21 CFR 101.9(f) (1) through (4).

(f) The Reference Daily Intakes and Daily Reference Values used shall be in accordance with 21 CFR 101.9(c)(8) (i) and (iii), 11(iv), and (12)(i).

(g) Compliance with this section shall be determined as follows:

(1) A production lot is that product from one production shift. Alternatively, a collection of primary containers or units of the same size, type, and style produced under conditions as nearly uniform as possible, designated by a common container code or marking, constitutes a lot.

(2) The sample for nutrient analysis shall consist of a composite of a minimum of six finished production units, one from each of six production lots. Alternatively, the sample for nutrient analysis shall consist of a composite of a minimum of six subsamples (consumer units), each taken from a randomly chosen shipping case, to be representative of a lot. Composites shall be analyzed by appropriate methods and procedures used by the Department for each nutrient in accordance with the "Chemistry Laboratory Guidebook," or, if no USDA method is available or appropriate in each case, by appropriate methods for each nutrient in accordance with the 1990 edition of the "Official Methods of Analysis of the Association of Official Analytical Chemists" (AOAC), 15th ed., which is incorporated by reference, unless a particular method of analysis is specified in 21 CFR 101.9(c), or, if no USDA, AOAC, or specified method is available and appropriate, by other reliable and appropriate analytical procedures. Copies of the AOAC Methods are available from the Association of Official Analytical Chemists, 2200

Wilson Blvd., suite 400, Arlington, VA 22201.

(3) Two classes of nutrients are defined for purposes of compliance:

(i) Class I. Added nutrients in fortified or fabricated foods, and

(ii) Class II. Naturally occurring (indigenous) nutrients. If any ingredient which contains a naturally occurring (indigenous) nutrient is added to a food, the total amount of such nutrient in the final food product is subject to Class II requirements unless the same nutrient is also added.

(4) A product with a label declaration of a vitamin, mineral, protein, total carbohydrate, complex carbohydrate, dietary fiber, unsaturated fat, or potassium shall be deemed to be misbranded under section 4(h) of the Poultry Products Inspection Act (21 U.S.C. 453(h)(4)), unless it meets the following requirements:

(i) Class I vitamin, mineral, protein, total carbohydrate, complex carbohydrate, dietary fiber, unsaturated fat, or potassium. The nutrient content of the composite is at least equal to the value for that nutrient declared on the label.

(ii) Class II vitamin, mineral, protein, total carbohydrate, complex carbohydrate, dietary fiber, unsaturated fat or potassium. The nutrient content of the composite is at least equal to 80 percent of the value for that nutrient declared on the label: *Provided,* That no regulatory action will be based on a determination of a nutrient value which falls below this level by a factor less than the variability generally recognized for the analytical method used in that product at the level involved.

(5) A product with a label declaration of calories, sugars, total fat, saturated fat, cholesterol, or sodium shall be misbranded under section 4(h) of the Poultry Products Inspection Act (21 U.S.C. 453(h)(4)), if the nutrient content of the composite is greater than 20 percent in excess of the value for that nutrient declared on the label.

(6) The amount of a vitamin, mineral, protein, total carbohydrate, complex carbohydrate, dietary fiber, unsaturated fat, or potassium may vary from the labeled amounts within good manufacturing practice.

(7) The management of the establishment must maintain records to support the validity of nutrient declarations contained on product labels. Such records shall be made available to the inspector or any duly authorized representative of the Agency upon request.

(8) A prerequisite for obtaining approval for labeling containing nutrient content claims as defined in these regulations is that an establishment has an approved partial quality control program as provided in § 381.145(d) to result in compliance with these provisions.

(9) The compliance provisions set forth in paragraph (g)(1) through (7) of this section shall not apply to single-ingredient, raw poultry products, including those that have been previously frozen, when nutrition labeling is based on the most current representative data base values contained in USDA's National Nutrient Data Bank or its published form, the Agriculture Handbook No. 8 series.

(h) Nutrition information provided by a manufacturer or distributor directly to professionals (e.g., physicians, dietitians, and educators) may vary from the requirements of this section, but shall also contain or have attached to it the nutrition information as required by this section.

§ 381.410 [Reserved]

§ 381.411 [Reserved]

§ 381.412 Reference amounts customarily consumed per eating occasion.

(a) The general principles followed in arriving at the Reference Amounts for serving (portion) sizes set forth in paragraph (b) of this section are found in 21 CFR 101.12(a) through (g), except paragraph (b).

(b) The following Product Categories and Reference Amounts shall be used as the basis for determining serving sizes for specific products:

TABLE 1.—REFERENCE AMOUNT CUSTOMARILY CONSUMED PER EATING OCCASION INFANT AND TODDLER FOODS [1] [2] [3]

Product category	Reference amount
Infant & Toddler Foods:	
Dinner Dry Mix	15 g
Dinner, ready-to-serve, strained type	60 g
Dinner, soups, ready-to-serve junior type	110 g
Dinner, stew or soup ready-to-serve toddlers	170 g

[1] These values represent the amount of food customarily consumed per eating occasion and were primarily derived from the 1977–1978 and the 1987–1988 Nationwide Food Consumption Surveys conducted by the U.S. Department of Agriculture.

[2] Unless otherwise noted in the Reference Amount column, reference amounts are for the ready-to-serve or almost ready-to-serve form of the product (i.e., heat and serve). If not listed separately, the Reference Amount for the unprepared form (e.g., dry cereal) is the amount required to make one Reference Amount of the prepared form.

[3] Manufacturers are required to convert the Reference Amount to the label serving size in a household measure most appropriate to their specific product using the procedures established by the regulation.

TABLE 2.—REFERENCE AMOUNT CUSTOMARILY CONSUMED PER EATING OCCASION GENERAL FOOD SUPPLY [1] [2] [3]

Product category [4]	Reference amount
Egg Mixtures, e.g., western style omelet, souffle, egg foo young with poultry	110 g
Salad and potato toppers, e.g., poultry bacon bits	7 g
Bacon, e.g., poultry breakfast strips	15 g
Dried, e.g., poultry jerky, dried poultry, poultry sausage products with a moisture/protein ratio of less than 2:1	30 g
Snacks, e.g., poultry snack food sticks	30 g
Luncheon products, poultry bologna, poultry Canadian style bacon, poultry franks, poultry crumbles, poultry luncheon loaf, poultry Polish sausage, potted poultry products, poultry taco fillings	55 g
Smoked or pickled, poultry smoked sausage	55 g
Entrees without sauce, poultry cuts, including marinated, tenderized, injected cuts of poultry, poultry corn dogs, poultry bagel dogs, poultry croquettes, poultry fritters, cured poultry ham products, adult pureed poultry	85 g
Canned poultry, canned chicken, canned turkey	85 g
Entrees with sauce, turkey and gravy	140 g
Mixed dishes, NOT measurable with a cup, e.g., poultry burrito, poultry enchiladas, poultry pizza, poultry quiche, all types of poultry sandwiches, cracker and poultry lunch-type packages, poultry gyro, poultry stromboli, poultry frank on a bun, poultry burger on a bun, poultry taco, chicken cordon bleu, poultry calzone, poultry lasagna, stuffed vegetables with poultry, poultry kabobs	140 g (plus 55 gms. for products with sauce toppings)
Mixed dishes, measurable with cup, e.g., poultry casserole, macaroni, cheese and poultry, poultry pot pie, poultry spaghetti with sauce, poultry chili, poultry chili with beans, poultry hash, creamed dried poultry, poultry ravioli in sauce, poultry a la king, poultry stew, poultry goulash	1 cup
Salads pasta or potato, potato salad with poultry, macaroni and poultry salad	140 g
Salads—all other, poultry salads, chicken salad, turkey salad	100 g
Soups—all varieties	1 cup
Major main entree type sauce, e.g., spaghetti sauce with poultry	½ cup
Minor main entree sauce, e.g., pizza sauce with poultry, gravy	¼ cup
Seasoning mixes dry, freeze dry, dehydrated, concentrated soup mixes, bases, extracts, dried broths and stock/juice, freeze dry trail mix product with poultry	
As reconstituted: Amount to make one Reference Amount of the final dish e.g.,	
gravy	¼ cup
major main entree type sauce	¼ cup
soup	1 cup

TABLE 2.—REFERENCE AMOUNT CUSTOMARILY CONSUMED PER EATING OCCASION GENERAL FOOD SUPPLY [1] [2] [3]—Continued

Product category [4]	Reference amount
entree measurable with a cup....	1 cup

[1] These values represent the amount of food customarily consumed per eating occasion and were primarily derived from the 1977–1978 and the 1987–1988 Nationwide Food Consumption Surveys conducted by the U.S. Department of Agriculture.

[2] Unless otherwise noted in the Reference Amount column, the reference amounts are for the ready-to-serve or almost ready-to-serve form of the product (i.e. heat and serve). If not listed separately, the Reference Amount for the unprepared form (e.g., dehydrated poultry dinner) is the amount required to make one Reference Amount of the prepared form.

[3] Manufacturers are required to convert the reference amounts to the label serving size in a household measure most appropriate to their specific product using the procedures established by regulation.

[4] Examples listed under Product Category are not all inclusive. Examples are provided to assist manufacturers in identifying appropriate product Reference Amount.

(c) The Reference Amounts set forth in paragraph (b) of this section shall be used to determine whether a product meets the USDA criteria for nutrient content claims such as "Low Calorie." If the serving size declared on the product label differs from the Reference Amount, both the Reference Amount and the serving size declared on the product label shall be used to determine whether the product meets the criteria for a claim.

(d) The Administrator, on his or her own initiative or on behalf of any interested person who has submitted a petition, may issue a proposal to establish or amend a Product Category or Reference Amount identified in paragraph (b) of this section. A petition to establish or amend a Product Category or Reference Amount shall include information as identified in 21 CFR 101.12(h) (1) through (11) and (13).

§ 381.413 Nutrient content claims; general principles.

(a) This section applies to poultry products that are intended for human consumption and that are offered for sale, except that nutrient content claims may not be made on products intended specifically for use by infants and toddlers less than 2 years of age.

(b) A claim, which expressly or by implication, characterizes the level of a nutrient (nutrient content claim) of the type required in nutrition labeling pursuant to § 381.409, may not be made on a label or in labeling of that product unless the claim is made in accordance with this subpart.

(1) An expressed nutrient content claim is any direct statement about the level (or range) of a nutrient in the food, e.g., "low sodium."

(2) An implied nutrient content claim is any claim that describes the product or an ingredient therein in such a manner that leads a consumer to assume that a nutrient is absent or present in a certain amount (e.g., "high in oat bran") or that the food may be useful in selecting foods that are helpful in achieving a total diet that conforms to current dietary recommendations (e.g., "healthy").

(c) Information required or permitted by § 381.409 to be declared in nutrition labeling, and that appears as part of the nutrition label, is not a nutrient content claim and is not subject to the requirements of this section. If such information is declared elsewhere on the label or in labeling, it is a nutrient content claim and is subject to the requirements for nutrient content claims.

(d) An individual product bearing a nutrient content claim shall meet the criteria for that claim on the basis of the reference amount customarily consumed (RACC) and the amount per labeled serving as specified in § 381.412(b).

(e)(1) A nutrient content claim may state the absence of a nutrient (e.g., Sodium free) if that nutrient is usually present in the product or in product for which the product is a substitute and the substitute food resembles the product for which it substitutes, i.e., is organoleptically, physically and functionally similar (including shelf life) and may be used interchangeably.

(i) If there is a difference in performance characteristics, the product may still be considered a substitute if the label includes a disclaimer adjacent to the most prominent claim as defined in paragraph (j)(2)(ii) of this section, informing the consumer of such difference.

(ii) This disclaimer must be in easily legible print or type and in a size no less than one-half the size of the type of the descriptive term but in no case less than one-sixteenth of an inch in height.

(2) Any claim for the absence of a nutrient in a products that has not been specially processed, altered, formulated or reformulated so as to eliminate the nutrient from the product shall indicate that the product inherently meets the criteria for that descriptor and shall clearly refer to all products of that type and not merely to the particular brand to which the labeling attaches. It shall not bear the descriptive term immediately preceding the name of the product because such terminology would imply that the product has been altered compared to other products of the same type.

(f) A nutrient content claim shall be, in type size and style, no larger than that of the statement of identity.

(g) The label or labeling of a product for which a nutrient content claim is made shall contain prominently and in immediate proximity to such claim the following referral statement: "See _____ for nutrition information" with the blank filled in with the identity of the panel on which nutrition labeling is located.

(1) The referral statement "See [*appropriate panel*] for nutrition information" shall be in easily legible boldface print or type in distinct contrast to other printed or graphic matter and no less than one-half the size of the type of the descriptive term but in no case less than one-sixteenth of an inch in height.

(2) The referral statement shall be immediately adjacent to the descriptive term and may have no intervening material other than the statement of identity. If the descriptive term appears on more than one panel of the label, the referral statement shall be adjacent to the claim on each panel except for the panel that bears the nutrition information.

(3) If a single panel of a label or labeling contains multiple nutrient content claims or a single claim repeated several times, a single referral statement may be made. The statement shall be adjacent to the claim that is printed in the largest type on that panel.

(h) In place of the referral statement described in paragraph (g) of this section, if a product contains more than 11.5 grams of fat, 4.0 grams of saturated fat, 45 milligrams of cholesterol, or 360 milligrams of sodium per reference amount customarily consumed (RACC), labeled serving size or per 100 grams, then that product must disclose, as part of the referral statement, that the nutrient exceeding the specified level is present in the product as follows: "See [*appropriate panel*] for information about [*nutrient requiring disclosure*] and other nutrients"; e.g., "See side panel for information about fats and other nutrients."

(i) The label or labeling of a product may contain a statement about the amount or percentage of a nutrient which implies that the product is high or low in that nutrient if the product actually meets the definition for either "high" or "low" as defined for the nutrient which the label addresses. Such a claim might be "Contains 100 mg of sodium per serving."

(j) Products may bear a statement that compares the level of a nutrient in the product with the level of a nutrient in a

reference food. These statements shall be known as "relative claims" and include "reduced", "light", and comparative claims.

(1) To bear a relative claim about level of a nutrient, the amount of that nutrient in the product must be compared as specified below to a reference food. Such products are:

(i) For all relative claims, an industrywide norm, i.e., a composite value weighted according to a national market share on a unit or tonnage basis of all the products of the same type as the product for which the claim is made, or

(ii) For reduced and comparative claims only, a manufacturer's regular product which has been offered for sale to the public on a regular basis for a substantial period of time in the same geographic area by the same business entity or by one entitled to use its trade name.

(iii) For comparative claims only, a product or class of product whose composition is reported in a current valid data base such as U.S. Department of Agriculture's Handbook 8, *Composition of Foods, Raw, Processed, Prepared.*

(2) For products bearing relative claims:

(i) The label must bear immediately adjacent to such claim in the most prominent location and in type no less than half the size of the type of the claim but no less than one-sixteenth inch, the following accompanying information:

(A) The percentage (or fraction) of the amount of the nutrient in the reference food by which the nutrient has been modified, (e.g., "50% less fat," "⅓ fewer calories"), and

(B) The identity of the reference food, and

(C) Clear and concise quantitative information comparing the amount of the subject nutrient in the product per labeled serving with that of the reference food.

(ii) The most prominent location shall be determined by the following order:

(A) A claim on the principal display panel adjacent to the statement of identity,

(B) A claim elsewhere on the principal display panel,

(C) A claim on the information panel, or

(D) A claim elsewhere on the label.

(iii) Relative claims for decreased levels of nutrients may be made on the label or in labeling of a product only if the nutrient content for that nutrient differs from that of the reference food by more than the amount specified in the definition of "low" for that nutrient.

(k) The term "modified" may be used in the statement of identity of a product that bears a comparative claim in conformance with the requirements of this subpart, followed immediately by the name of the nutrient whose content has been altered; e.g., "Modified fat ground turkey." This statement of identity must be immediately followed by the comparative statement such as "Contains 35% less fat than _____" and all other information required in paragraph (j)(2) of this section for comparative claims.

(l) For purposes of making a claim, a "meal-type product" shall be defined as a product that:

(1) Makes a significant contribution to the diet by:

(i) Providing at least 200 calories per serving (container), or

(ii) Weighing at least 6 ounces per serving (container), and

(2) Contains ingredients from two or more of the following four food groups:

(i) Bread, cereal, rice and pasta group,

(ii) Fruits and vegetables group,

(iii) Milk, yogurt, and cheese group, and

(iv) Meat, poultry, fish, dry beans, eggs, and nuts group.

(3) Is represented as, or is in a form commonly understood to be a breakfast, lunch, dinner, meal, main dish, entree, or pizza. Such representations may be made either by statements, photographs, or vignettes.

(m) [Reserved]

(n) Compliance with requirements for nutrient content claims will be determined using analytical methodology prescribed for determining compliance with nutrition labeling in § 317.309(g) of this subpart.

(o) The following exemptions apply:

(1) Nutrient content claims that have not been defined by regulation and that appear as part of a brand name that was in use prior to November 27, 1991 may continue to be used as part of that brand name, provided they are not false or misleading under section 4(h) of the Act (21 U.S.C. 453(h)(4)).

(2) [Reserved]

(3) A statement that describes the percentage of a vitamin or mineral in the food in relation to a reference daily intake (RDI) as defined in 21 CFR 101.9(c) may be made on the label.

(4) The requirements of this section do not apply to products for special dietary use as described in § 381.124.

(5) [Reserved]

(6) Nutrient content claims that were part of the name of a product that was subject to a standard of identity as of November 27, 1991 are not subject to the requirements of paragraphs (b), (g), and (h) of this section whether or not they meet the definition of the descriptive term.

(7) Implied nutrient content claims may be used as part of a brand name, provided that the use of the claim has been authorized by USDA. Petitions requesting approval of such a claim (e.g., healthy) may be submitted pursuant to § 381.469.

§§ 381.414-381.442 [Reserved]

§ 381.443 Significant participation for voluntary nutrition labeling.

(a) In evaluating significant participation for voluntary nutrition labeling, FSIS will consider only the major cuts of single-ingredient, raw poultry products, as identified in § 381.444, including those that have been frozen.

(b) FSIS wi11 judge a food retailer to be participating at a significant level if the retailer provides nutrition labeling information for at least 90 percent of the major cuts of single-ingredient, raw poultry products, listed in § 381.444, that it sells, and if the nutrition label is consistent in content and format with the mandatory program, or nutrition information is displayed at point-of-purchase in an appropriate manner.

(c) To determine whether there is significant participation by retailers under the voluntary nutrition labeling guidelines, FSIS will select a representative sample of companies allocated by type and size.

(d) FSIS will find that significant participation by food retailers exists if at least 60 percent of all companies that are evaluated are participating in accordance with the guidelines.

(e) FSIS will evaluate significant participation of the voluntary program every 2 years beginning in May 1995.

(1) If significant participation is found, the voluntary nutrition labeling guidelines shall remain in effect.

(2) If significant participation is not found, FSIS shall initiate rulemaking to require nutrition labeling on those products under the voluntary program.

§ 381.444 Identification of the major cuts of poultry products.

The major cuts of poultry products are: Whole chicken, chicken breast, chicken wing, chicken drumstick, chicken thigh, whole turkey, turkey breast, turkey wing, turkey drumstick, and turkey thigh.

§ 381.445 Guidelines for voluntary nutrition labeling of single-ingredient, raw products.

(a) Nutrition information on single-ingredient, raw poultry products, including those that have been

previously frozen, shall be provided in the following manner:

(1) If a retailer chooses to provide nutrition information on the label of these products, the products shall be subject to all requirements of the mandatory nutrition labeling program, except that nutrition labeling may be declared on the basis of either "as consumed" or "as packaged." In addition, the declaration of the number of servings per container need not be included in nutrition labeling of single-ingredient, raw poultry products, including those that have been previously frozen.

(2) If a retailer chooses to provide nutrition information at the point-of-purchase by an appropriate means, such as by posting a sign, or by making the information available in brochures, notebooks, or leaflet form in close proximity to the food, nutrition information shall be provided as specified in this subpart for the mandatory nutrition labeling program. The nutrition labeling information may also be supplemented by a video, live demonstration, or other media.

(b) The declaration of nutrition information shall be presented in an abbreviated format as specified in § 381.409(e) of this subpart for the mandatory nutrition labeling program.

(c) The nutrition label data should be based on either raw or cooked edible portions of poultry cuts with skin. If data are based on cooked portions, the methods used to cook the products must be specified and should be those which do not add nutrients from other ingredients such as flour, breading, and salt. Additional nutritional data may be presented on an optional basis for the cooked edible portions of the skinless poultry meat.

(d) Nutrient data that are the most current representative data base values contained in USDA's National Nutrient Data Bank or its published form, the Agriculture Handbook No. 8 series, may be used for nutrition labeling of single-ingredient, raw poultry products, including those that have been previously frozen. These data may be composite data that reflect different classes of turkey or other variables affecting nutrient content. Alternatively, data that reflect specific, classes or other variables may be used, except that if data are used on labels attached to a product which is labeled as to class of poultry or other variables, the data must represent the product in the package when such data are contained in the representative data base. When data are used on labels attached to a product, the data must represent the edible poultry tissues present in the package.

(e) If the nutrition information is in accordance with paragraph (d) of this section, a nutrition label or labeling will not be subject to the Agency compliance review under § 381.409(g), unless a nutrition claim is made on the basis of the representative data base values.

(f) Retailers may use data bases that they believe reflect the nutrient content of single-ingredient, raw poultry products, including those that have been previously frozen; however, such labeling shall be subject to the compliance procedures of paragraph (d) of this section and the requirements specified in this subpart for the mandatory nutrition labeling program.

§§ 381.446–381.453 [Reserved]

§ 381.454 Nutrient content claims for "source" and "high".

(a) *General requirements.* Except as provided in paragraph (e) of this section, the following nutrient content claims about a nutrient in a product in relation to the Reference Daily Intake (RDI) established for that nutrient in 21 CFR 101.9(c)(11)(iv) or Daily Reference Value (DRV) established for that nutrient in 21 CFR 101.9(c)(12)(i), excluding total carbohydrates and unsaturated fatty acids, may be used on the label or in labeling, provided that:

(1) The product is labeled in compliance with § 381.409, and

(2) The nutrient content claim complies with the requirements of § 381.413.

(b) *High.* The term "high" may be used on the label or in labeling of a product:

(1) When the product (except meal-type products as described in § 381.413(l)) contains 20 percent or more of the RDI or the DRV per reference amount customarily consumed (RACC) and per labeled serving, or

(2) If it is a meal-type product as described in § 381.413(l) and it contains per 100 grams of product, an amount of the nutrient that is equal to 20 percent or more of the RDI or DRV.

(c) *Source.* The term "source" may be used on the label or in labeling of a product:

(1) When the product (except meal-type products as described in § 381.413(l)) contains 10 to 19 percent of the RDI or the DRV per reference amount customarily consumed (RACC) and per labeled serving, or

(2) If it is a meal-type product as described in § 381.413(l), and it contains per 100 grams of product, an amount of the nutrient that is equal to 10–19 percent of the RDI or DRV.

(d) *Fiber claim.* If a nutrient content claim is made with respect to the level of dietary fiber, that is, the product is high in fiber or a source of fiber and the product is not low in total fat as defined in § 381.462(b), then the label must disclose the level of total fat as part of the referral statement, e.g., "See [*appropriate panel*] for nutrition information. Contains [*x amount*] of total fat per serving."

(e)(1) *More.* A comparative claim using the term "more" may be used to describe the level of protein, vitamins, minerals, dietary fiber, or potassium in a product, provided that:

(i) The product contains at least 10 percent of the RDI for protein, vitamins, or minerals or of the DRV for dietary fiber, or potassium more than the reference food that it resembles and for which it substitutes; and

(ii) As required in § 381.413(j) for relative claims, the percentage (or fraction) that the nutrient was increased relative to the RDI or DRV; the identity of the reference food; and clear and concise quantitative information comparing the level of the nutrient in the product per labeled serving, with that of the reference food it replaces are declared in immediate proximity to the most prominent such claim.

(2) A comparative claim using the term "more" may be used to describe the level of carbohydrates in a product, provided that the product contains at least 10 percent of the DRV for carbohydrates more than the reference food and the difference between the two products is only complex carbohydrates as defined in 21 CFR 101.9(c)(6)(i). The product must also meet the requirement of paragraph (e)(1)(ii) of this section.

(3) A comparative claim using the term "more" may be used to describe the level of unsaturated fat in a product, provided that the level of total fat is not increased and the level of trans fatty acids does not exceed 1 percent. The reference food must also meet the requirements of paragraph (e)(1)(ii) of this section.

§ 381.455 [Reserved]

§ 381.456 Nutrient content claims for "light" or "lite".

(a) *General requirements.* The following nutrient content claims using the term "light" or "lite" to describe a product may be used on the label and in labeling, provided that:

(1) The product is labeled in compliance with § 381.409, and

(2) The nutrient content claim complies with the requirements of § 381.413.

(b) The terms "light" or "lite" may be used without further qualification to describe a product, provided that:

(1) The product has at least a one-third (33⅓%) reduction in the number of calories compared to a reference food as specified in § 381.413(j)(1)(i) with a minimum reduction of more than 40 calories per reference amount customarily consumed (RACC) and per labeled serving;

(2) If it derives more than 50 percent of its calories from fat, its fat content is reduced by 50 percent or more compared to the reference food that it resembles or for which it substitutes as specified in § 381.413(j)(1)(i) with a minimum reduction of more than 3 grams per reference amount customarily consumed (RACC) and per labeled serving; and

(3) As required in § 381.413(j) for relative claims, the percent (or fraction) that the calories, and, if appropriate, the fat, were reduced; the identity of the reference food; and clear and concise quantitative information comparing the level of calories and, if appropriate, fat content, in the product per labeled serving, with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim (e.g., "⅓ fewer calories and 50% less fat than our regular Italian sausage: Lite Italian turkey sausage 200 calories, 4 grams fat; regular Italian turkey sausage 300 calories, 8 grams fat per serving.").

(c) A product, other than a salt substitute, that is low, reduced or otherwise altered in sodium content cannot use the term "light" solely because of this alteration but rather must use, as appropriate, the term "reduced sodium" or "low sodium."

(d) The term "light" or "lite" may be used to describe a salt substitute if the sodium content of the product has been reduced by at least 50 percent compared to ordinary table salt.

(e) The term "light" or "lite" may not be used to refer to a product that is not reduced in calories by one-third, and, if applicable, fat by 50 percent unless:

(1) It describes some physical or organoleptic attribute of the product such as texture or color and the qualifying information, so stated, clearly conveys the nature of the product, and

(2) The qualifying information is in the same type size, style, color and prominence as the word "light" and in immediate proximity thereto.

(f) [Reserved]

§§ 381.457–381.459 [Reserved]

§ 381.460 Nutrient content claims for calorie content.

(a) *General requirements.* The following nutrient content claims about the calorie content of a product may be used on the label or in labeling, provided that:

(1) The product is labeled in compliance with § 381.409, and

(2) The nutrient content claims comply with the requirements of § 381.413.

(b) *Calorie content claims.* (1) The terms "calorie free", "free of calories", "no calories", or "zero calories" may be used on the label or in labeling of a product that usually contains or substitutes, as specified in § 381.413(e)(1), for a product that usually contains calories, provided that:

(i) The product contains less than 5 calories per reference amount customarily consumed (RACC) and per labeled serving.

(ii) If a product meets this condition without the benefit of special processing, alteration, formulation or reformulation to lower the caloric content, it is labeled to disclose that calories are not usually present in the product.

(2) The terms "low calorie", "low in calories", or "a low calorie food" may be used on the label or in labeling of products (except meal-type products as described in § 381.413(l)), provided that:

(i) The product does not provide more than 40 calories per reference amount customarily consumed (RACC) and per labeled serving, and

(ii) The product does not provide more than 40 calories per 100 grams or is a sugar substitute.

(iii) If a product meets these conditions without the benefit of special processing, alteration, formulation or reformulation to vary the caloric content, it is labeled to clearly refer to all products of its type and not merely to the particular brand to which the label attaches.

(3) The terms "low calorie", "low in calories", or "low calorie meal" may be used on the label or in labeling of meal-type products, provided that the meal contains 105 calories or less per 100 grams of product and meets the requirement of paragraph (b)(2)(iii) of this section.

(4) The terms "reduced calorie", "reduced in calorie", or "calorie reduced" may be used to describe a product (except mealtype products as described in § 381.413(l)), provided that:

(i) The product has been specifically formulated or processed to reduce its calorie content by 33⅓ percent or more with a minimum reduction of more than 40 calories per reference amount customarily consumed (RACC) and per labeled serving from the reference food that it resembles and for which it substitutes as specified in § 381.413(j)(l)(i) and (ii); and

(ii) As required in § 381.413(j) for relative claims, the percent (or fraction) that the calories were reduced; and the identity of the reference food is declared; and clear and concise quantitative information comparing the level of the nutrient in the product per labeled serving with that of the reference food that it replaces in immediate proximity to the most prominent such claim (e.g., "33⅓percent fewer calories than regular salami. Calorie content has been reduced from 150 to 100 calories per serving").

(5) A comparative claim using the term "fewer" may be used on the label or in labeling of a product, including meal type products as defined in § 381.413(l), provided that:

(i) The product contains at least 25 percent fewer calories, with a minimum reduction of more than 40 calories per reference amount customarily consumed (RACC) and per labeled serving, than the reference food that it resembles and for which it substitutes as specified in § 381.413 (j)(1)(i) (ii) and (iii); and

(ii) As required in § 381.413(j) for relative claims, the percent (or fraction) that the calories were reduced; the identity of the reference food; and clear and concise quantitative information comparing the level of the calories in the product per labeled serving with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim (e.g., "This Italian turkey sausage contains 25 percent fewer calories than our regular Italian turkey sausage. Calorie content has been lowered from 200 to 150 calories per serving.").

(c) *Use of terms such as "sugars free", "no sugars", or "zero sugars".* (1) Consumers may reasonably be expected to regard terms that represent that the product contains no sugars or sweeteners, e.g., "sugars free" or "no sugars", as indicating a product which is low in calories or significantly reduced in calories. Consequently, except as provided in paragraph (c)(2) of this section, a product may not be labeled with such terms unless:

(i) The product contains less than 0.5 grams of sugars, as defined in 21 CFR 101.9(c)(6)(ii)(A) per reference amount customarily consumed (RACC) and per labeled serving;

(ii) The product contains no added ingredients that are sugars; and

(iii) (A) It is labeled "low calorie" or "reduced calorie" or bears a comparative claim of special dietary usefulness labeled in compliance with paragraph (b) (2), (3), or (4) of this section, or

(B) Such term is immediately accompanied, each time it is used, by the statement "Not a reduced calorie food", "Not a low calorie food", or "Not for weight control."

(2) The terms "no added sugars", "without added sugars", or "no sugars added" may be used, provided:

(i) No amount of sugars as defined in 21 CFR 101.9(c)(6)(ii)(A) is added during processing or packaging;

(ii) The product does not contain ingredients containing added sugars such as jam, jelly, and concentrated fruit juice;

(iii) The sugars or content has not been increased above the amount naturally present in the ingredient(s) by some means such as the use of enzymes;

(iv) The product that it resembles and for which it substitutes normally contains added sugars; and

(v) The product bears a statement indicating that the product is not low calorie or calorie reduced (unless the product meets the requirements for a low or reduced calorie product) and directing consumers' attention to the nutrition panel for further information on sugars and calorie content.

(3) Paragraph (c)(1) of this section shall not apply to a factual statement that a product is unsweetened or contains no added sweeteners in the case of a product that contains apparent substantial inherent sugar content, e.g., juices.

§ 381.461 Nutrient content claims for sodium content.

(a) *General requirements.* The following nutrient content claims about the sodium content of a product may be used on the label and in labeling, provided that:

(1) The product is labeled in compliance with § 381.409; and

(2) The nutrient content claims comply with § 381.413.

(b) *Sodium content claims.* (1) The terms "sodium free", "free of sodium", "no sodium", or "zero sodium" may be used on the label or in labeling of a product that usually contains or substitutes as specified in § 381.423(e)(1) for a product that usually contains sodium, provided that:

(i) The product contains less than 5 milligrams of sodium per reference amount customarily consumed (RACC) and per labeled serving; and

(ii) The product contains no ingredient that is salt (sodium chloride); and

(iii) If a product meets this condition without the benefit of special processing, alteration, formulation or reformulation to lower the sodium content, it is labeled to disclose that sodium is not usually present in the product, e.g., "_____, a sodium free food."

(2) The terms "very low sodium", "very low in sodium", and "a very low sodium food" may be used on the label or in labeling of products (except meal-type products as described in § 381.413(l)), provided that:

(i) The product does not provide more than 35 milligrams of sodium per reference amount customarily consumed (RACC) and per labeled serving, and

(ii) The product does not provide more than 35 milligrams of sodium per 100 grams.

(iii) If a product meets these conditions without the benefit of special processing, alteration, formulation or reformulation to vary the sodium content, it is labeled to clearly refer to all products of its type and not merely to the particular brand to which the label attaches (e.g., "_____, a very low sodium food").

(3) The term "very low sodium", "very low in sodium", or "very low sodium meal" may be used on the label or in labeling of meal-type products as defined in § 381.413(l), provided that the meal contains 35 milligrams or less of sodium per 100 grams of product and meets the requirement of paragraph (b)(2)(iii) of this section.

(4) The terms "low sodium", "low in sodium", or "a low sodium food" may be used on the label or in labeling of products (except meal-type products as defined in § 381.413(l)), provided that:

(i) The product does not provide more than 140 milligrams of sodium per reference amount customarily consumed (RACC) and per labeled serving; and

(ii) The product does not provide more than 140 milligrams of sodium per 100 grams.

(iii) If a product meets these conditions without the benefit of special processing, alteration, formulation or reformulation to vary the sodium content, it is labeled to clearly refer to all products of its type and not merely to the particular brand to which the label attaches (e.g., "_____, a low sodium food").

(5) The term "low sodium", "low in sodium", or "low sodium meal" may be used on the label or in labeling of meal-type products as described in § 381.413(l), provided that the meal contains 140 milligrams or less sodium per 100 grams of product and meets the requirement of paragraph (b)(4)(iii) of this section.

(6) The term "reduced sodium", "reduced in sodium", or "sodium reduced" may be used to describe a product (except meal-type products as defined in § 381.413(l)), provided that:

(i) The product has been specifically formulated, altered, or processed to reduce its sodium content by 50 percent or more with a minimum of more than 140 milligrams per reference amount customarily consumed (RACC) and per labeled serving from the reference food that it resembles and for which it substitutes as specified in § 381.413(j)(1)(i) and (ii); and

(ii) As required in § 381.413(j) for relative claims, the percent (or fraction) that the sodium was reduced; the identity of the reference food; and clear and concise quantitative information comparing the level of the sodium in the product per labeled serving with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim (e.g., "reduced sodium—50 percent less sodium that regular _____. Sodium content has been reduced from 300 to 150 milligrams of sodium per serving.").

(7) A comparative claim using the term "less" may be used on the label or in labeling of a product including meal-type products as defined in § 381.413(l), provided that:

(i) The product contains at least 25 percent less sodium with a minimum reduction of more than 140 milligrams per reference amount customarily consumed (RACC) and per labeled serving than the reference food that it resembles and for which it substitutes as specified in § 381.413(j)(l) (i), (ii), and (iii); and

(ii) As required in § 381.413(j) for relative claims, the percent (or fraction) that the sodium was reduced; the identity of the reference food; and clear and concise quantitative information comparing the level in the sodium in the product per labeled serving with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim (e.g., "This chicken noodle soup contains 25% less sodium than our regular chicken noodle soup. Sodium content has been lowered from 300 to 325 milligrams per serving.").

(c) The term "salt" is not synonymous with "sodium." Salt refers to sodium chloride. However, references to salt content such as "unsalted", "no salt", and "no salt added" are potentially misleading.

(1) The term "salt free" may be used on the label or in labeling of products only if the product is "sodium free" as defined in paragraph (b)(1) of this section.

(2) The terms "unsalted", "without added salt", and "no salt added" may be used on the label or in labeling of products, provided:

(i) No salt is added during processing;

(ii) The product that it resembles and for which it substitutes is normally processed with salt; and

(iii) If the product is not sodium free, such claims are immediately accompanied each time they are used, by the statement, "Not a sodium free food" or "Not for control of sodium in the diet."

§ 381.462 Nutrient content claims for fat, fatty acids, and cholesterol content of poultry products.

(a) *General requirements.* A claim about the level of fat, fatty acid, and cholesterol in a poultry product may only be made on the label and in the labeling of the product if:

(1) The claim uses one of the terms defined in this section in accordance with the definition for that term;

(2) The claim is made in accordance with the general requirements for nutrient content claims in § 381.413; and

(3) The poultry product for which the claim is made is labeled in accordance with § 381.409.

(b) *Fat content claims.* (1) The terms "fat free", "free of fat", "no fat", "zero fat", or "nonfat" may be used on the label or in labeling of a poultry product, provided that:

(i) The product contains less than 0.5 gram of fat per reference amount customarily consumed and per labeled serving size;

(ii) The product contains no added ingredient that is a fat or oil; and

(iii) As required in § 381.413(e)(2), if the poultry product meets these conditions without the benefit of special processing, alteration, formulation or reformulation to lower fat content, it is labeled to disclose that fat is not usually present in the product.

(2) The terms "low fat" or "low in fat" may be used on the label or in labeling of poultry products, except meal-type products as defined in § 381.413(l), provided that:

(i) The product contains 3 grams or less of fat per reference amount customarily consumed, per labeled serving size, and per 100 grams of product; and

(ii) If the poultry product meets these conditions without the benefit of special processing, alteration, formulation or reformulation to lower fat content, it is labeled to clearly refer to all products of its type and not merely to the particular brand to which the label attaches.

(3) The terms "low fat" or "low in fat" may be used on the label or in labeling of a meal-type product as defined in § 381.413(l), provided that:

(i) The product contains 3 grams or less of fat per 100 grams; and

(ii) If the product meets these conditions without the benefit of special processing, alteration, formulation or reformulation to lower fat content, it is labeled to clearly refer to all products of its type and not merely to the particular brand to which the label attaches.

(4) The terms "reduced fat", "reduced in fat", or "fat reduced" may be used on the label or in labeling of a product, except meal-type products as defined in § 381.413(l), provided that:

(i) The product has been specifically formulated, altered, or processed to reduce its fat content by 50 percent or more, with a minimum reduction of more than 3 grams per reference amount customarily consumed and per labeled serving size, from the reference food that it resembles and for which it substitutes as defined in § 381.413(j)(1)(i) and (ii); and

(ii) As required in § 381.413(j)(2) for relative claims, the percent (or fraction) that the fat has been reduced, the identity of the reference food, and quantitative information comparing the level of fat in the product per labeled serving size with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim as defined in § 381.413(j)(2)(ii) (e.g., "Reduced fat—50 percent less fat than our regular ground turkey. Fat content has been reduced from 28 grams to 14 grams per serving.").

(5) A comparative claim using the term "less" may be used on the label or in labeling of a poultry product, including meal-type products as defined in § 381.413(l), provided that:

(i) The product contains at least 25 percent less fat, with a minimum reduction of more than 3 grams per reference amount customarily consumed and per labeled serving size, from the reference food that it resembles and for which it substitutes as defined in § 381.413(j)(2)(i), (ii), and (iii); and

(ii) As required in § 381.413(j)(2) for relative claims, the percent (or fraction) that the fat has been reduced, the identity of the reference food, and the quantitative information comparing the level of fat in the product per labeled serving size with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim as defined in § 381.413(j)(2)(ii) (e.g., "This _____ contains 40 percent less fat than _____. Fat content has been lowered from 9 grams to 5.5 grams per serving.").

(6) The term "_____ percent fat free" may be used on the label or in labeling of a poultry product, provided that:

(i) The product meets the criteria for "low fat" in paragraph (b)(2) or (3) of this section.

(ii) The label or labeling discloses the amount of total fat per serving (as declared on the label) of the poultry product expressed in grams to the nearest one-half gram. When the total fat content is less than 0.5 grams per serving, the amount may be declared as "0." Such disclosure shall appear in immediate proximity to the most prominent such claim as defined in § 381.413(j)(2)(ii) and in type size that shall be no less than one-half the size of the type used for such claim.

(iii) The percent of reduction and the words "fat free" are in uniform type size.

(iv) A claim for "100 percent fat free" meets all criteria for "fat free" in paragraph (b)(1) of this section.

(c) *Fatty acid content claims.* The label or labeling of poultry products that bear claims with respect to the level of saturated fat shall disclose the level of total fat and cholesterol in the product in immediate proximity to such claim each time the claim is made and in type that shall be no less than one-half the size of the type used for the claim with respect to the level of saturated fat. Declaration of cholesterol content may be omitted when the product contains less than 2 milligrams of cholesterol per labeled serving size.

(1) The terms "low in saturated fat" or "low saturated fat" may be used on the label or in labeling of a poultry product, except meal-type products as defined in § 381.413(l), provided that:

(i) The product contains 1 gram or less of saturated fatty acids per reference amount customarily consumed and per labeled serving size, and not more than 15 percent of calories from saturated fatty acids; and

(ii) If a product meets these conditions without benefit of special processing, alteration, formulation or reformulation to lower saturated fat content, it is labeled to clearly refer to all foods of its type and not merely to the particular brand to which the label attaches.

(2) The terms "low in saturated fat" or "low saturated fat" may be used on the label or in labeling of a meal-type product as defined in § 381.413(l), provided that:

(i) The product contains 1 gram or less of saturated fatty acids per 100 grams of product; and

(ii) If the product meets these conditions without the benefit of special processing, alteration, formulation or reformulation to lower saturated fat content, it is labeled to clearly refer to all products of its type and not merely to

the particular brand to which the label attaches.

(3) The terms "reduced saturated fat", "reduced in saturated fat", or "saturated fat reduced" may be used on the label or in labeling of a poultry product, except meal-type products as defined in § 381.413(l), provided that:

(i) The product has been specifically formulated, altered, or processed to reduce its saturated fatty acid content by 50 percent or more, with a minimum reduction of more than 1 gram per reference amount customarily consumed and per labeled serving size, from the reference food that it resembles and for which it substitutes as defined in § 381.413(j)(1) (i) and (ii); and

(ii) As required in § 381.413(j)(2) for relative claims, the percent (or fraction) that the saturated fat was reduced, the identity of the reference food, and the quantitative information comparing the level of saturated fat in the product per labeled serving size with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim as defined in § 381.413(j)(2)(ii) (e.g., "Reduced saturated fat. Contains 50 percent less saturated fat than the national average for _____. Saturated fat reduced from 14 grams to 7 grams per serving").

(4) A comparative claim using the term "less" may be used on the label or in labeling of a poultry product, including meal-type products as defined in § 381.413(l), provided that:

(i) The product contains 25 percent less saturated fat with a minimum reduction of more than 1 gram per reference amount customarily consumed and per labeled serving size, from the reference food that it resembles and for which it substitutes as defined in § 381.413(j)(1) (i), (ii), (iii); and

(ii) As required in § 381.413(j)(2) for relative claims, the percent (or fraction) that the saturated fat was reduced, the identity of the reference food, and quantitative information comparing the level of saturated fat in the product per labeled serving size with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim as defined in § 381.413(j)(2)(ii) (e.g., "Brand Y _____ contains 40 percent less saturated fat than our regular Brand X _____. Brand Y contains 6 grams of saturated fat; Brand X contains 10 grams of saturated fat.").

(d) *Cholesterol content claims.* (1) The terms "cholesterol free", "free of cholesterol", "zero cholesterol", or "no cholesterol" may be used on the label or in labeling of a poultry product, provided that:

(i) For products that contain 11.5 grams or less of total fat per reference amount customarily consumed, per labeled serving size, and per 100 grams of product:

(A) The product contains less than 2 milligrams of cholesterol per reference amount customarily consumed and per labeled serving size;

(B) The product contains 2 grams or less of saturated fat per reference amount customarily consumed and per labeled serving size;

(C) As required in § 381.413(e), if the product contains less than 2 milligrams of cholesterol per reference amount customarily consumed and per labeled serving size without the benefit of special processing, alteration, formulation or reformulation to lower cholesterol content, it is labeled to disclose that cholesterol is not usually present in the product.

(ii) For products that contain more than 11.5 grams of total fat per reference amount customarily consumed, per labeled serving size, or per 100 grams of product:

(A) The product contains less than 2 milligrams of cholesterol per reference amount customarily consumed and per labeled serving size;

(B) The product contains 2 grams or less of saturated fat per reference amount customarily consumed and per labeled serving size; and

(C) The label or labeling discloses the level of total fat in a serving (as declared on the label) of the product. Such disclosure shall appear in immediate proximity to such claim preceding the referral statement required in § 381.413(g) in type that shall be no less than one-half the size of the type used for such claim. If the claim appears on more than one panel, the disclosure shall be made on each panel except for the panel that bears nutrition labeling. If the claim appears more than once on a panel, the disclosure shall be made in immediate proximity to the claim that is printed in the largest type; and

(D) As required in § 381.413(e), if the poultry product contains less than 2 milligrams of cholesterol per reference amount customarily consumed and per labeled serving size without the benefit of special processing, alteration, formulation, or reformulation to lower cholesterol content, it is labeled to disclose that cholesterol is not usually present in the product, or

(E) If the product contains less than 2 milligrams of cholesterol per reference amount customarily consumed and per labeled serving size only as a result of special processing, alteration, formulation, or reformulation, the amount of cholesterol is substantially less (i.e., meet requirements of paragraph (d)(5)(i)(A) of this section) than the product for which it substitutes as specified in § 381.413(d) that has a significant (i.e., 5 percent or more) market share. As required in § 381.413(j)(2) for relative claims, the percent (or fraction) that the cholesterol was reduced, the identity of the reference food, and the quantitative information comparing the level of cholesterol in the product per labeled serving size with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim as defined in § 381.413(j)(2)(ii).

(2) The terms "low in cholesterol" or "low cholesterol" may be used on the label or in labeling of a poultry product, except meal-type products as defined in § 381.413(l), provided that:

(i) For products that contain 11.5 grams or less of total fat per reference amount customarily consumed, per labeled serving size, and per 100 grams of product:

(A) The product contains 20 milligrams or less of cholesterol per reference amount customarily consumed, per labeled serving size, and per 100 grams of product;

(B) The product contains 2 grams or less of saturated fatty acids per reference amount customarily consumed and per labeled serving size;

(C) As required in § 381.413(e), if the product contains 20 milligrams or less of cholesterol per reference amount customarily consumed, per labeled serving size, and per 100 grams of product without the benefit of special processing, alteration, formulation, or reformulation to lower cholesterol content, it is labeled to clearly refer to all products of that type and not merely to the particular brand to which the label attaches.

(ii) For products that contain more than 11.5 grams of total fat per reference amount customarily consumed, per labeled serving size, or per 100 grams of product:

(A) The product contains 20 milligrams or less of cholesterol per reference amount customarily consumed, per labeled serving size, and per 100 grams of product;

(B) The product contains 2 grams or less of saturated fatty acids per reference amount customarily consumed and per labeled serving size; and

(C) The label or labeling discloses the level of total fat in a serving (as declared on the label) of the product. Such disclosure shall appear in immediate proximity to such claim

preceding the referral statement required in § 381.413(g) in type that shall be no less than one-half the size of the type used for such claim. If the claim appears on more than one panel, the disclosure shall be made on each panel except for the panel that bears nutrition labeling. If the claim is made more than once on a panel, the disclosure shall be made in immediate proximity to the claim that is printed in the largest type; and

(D) As required in § 381.413(e)(2), the product contains 20 milligrams or less of cholesterol per reference amount customarily consumed, per labeled serving size, and per 100 grams of product without the benefit of special processing, alteration, formulation, or reformulation to lower cholesterol content, it is labeled to clearly refer to all products of that type and not merely to the particular brand to which the label attaches, or

(E) If the product contains 20 milligrams or less of cholesterol only as a result of special processing, alteration, formulation, or reformulation, the amount of cholesterol is substantially less (i.e., meets requirements of paragraph (d)(5)(i)(A) of this section) than the food for which it substitutes as specified in § 381.413(d) that has a significant (i.e., 5 percent or more) market share. As required in § 381.413(j)(2) for relative claims, the percent (or fraction) that the cholesterol has been reduced, the identity of the reference food, and the quantitative information comparing the level of cholesterol in the product per labeled serving size with that of the reference food are declared in immediate proximity to the most prominent such claim as defined in § 381.413(j)(2)(ii).

(3) The terms "low in cholesterol" or "low cholesterol" may be used on the label or in labeling of a meal-type product as defined in § 381.413(l) provided that the product meets the requirements of paragraph (d)(2) of this section except that the determination as to whether paragraph (d)(2)(i) or (ii) of this section applies to the product will be made only on the basis of whether the product contains 11.5 grams or less of fat per 100 grams of product, the requirement in paragraphs (d)(2) (i)(A) and (ii)(A) of this section shall be limited to 20 milligrams of cholesterol per 100 grams, and the requirement in paragraphs (d)(2) (i)(B) and (ii)(B) of this section shall be modified to require that the product contain 2 grams or less of saturated fat per 100 grams rather than per reference amount customarily consumed and per labeled serving size.

(4) The terms "reduced cholesterol", "reduced in cholesterol", or "cholesterol reduced" may be used on the label or in labeling of a poultry product or a product that substitutes for that food as specified in § 381.413(d), except meal-type products as defined in § 381.413(l), provided that:

(i) For products that contain 11.5 grams or less of total fat per reference amount customarily consumed, per labeled serving size, and per 100 grams:

(A) The product has been specifically formulated, altered, or processed to reduce its cholesterol content by 50 percent or more, with a minimum reduction of more than 20 milligrams per reference amount customarily consumed and per labeled serving size from the reference food that it resembles and for which it substitutes as defined in § 381.413(j)(1)(i) and (ii);

(B) The product contains 2 grams or less of saturated fatty acids per reference amount customarily consumed and per labeled serving size; and

(C) As required in § 381.413(j)(2) for relative claims, the percent that the cholesterol has been reduced, the identity of the reference food, and quantitative information comparing the level of cholesterol in the product per labeled serving size with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim as defined in § 381.413(j)(2)(ii). (ii) For products that contain more than 11.5 grams of total fat per reference amount customarily consumed, per labeled serving size, or per 100 grams of product:

(A) The product has been specifically formulated, altered, or processed to reduce its cholesterol content by 50 percent or more, with a minimum reduction of more than 20 milligrams per reference amount customarily consumed and per labeled serving size, from the reference food (as defined in § 381.413(j)(1) (i) and (ii)) that it resembles and for which it substitutes as specified in § 381.423(d) that has a significant (i.e., 5 percent or more) market share;

(B) The product contains 2 grams or less of saturated fatty acids per reference amount customarily consumed and per labeled serving size; and

(C) The label or labeling discloses the level of total fat in a serving (as declared on the label) of the product. Such disclosure shall appear in immediate proximity to such claim preceding the referral statement required in § 381.413(g) in type that shall be no less than one-half the size of the type used for such claim. If the claim appears on more than one panel, the disclosure shall be made on each panel except for the panel that bears nutrition labeling. If the claim is made more than once on a panel, the disclosure shall be made in immediate proximity to the claim that is printed in the largest type; and

(D) As required in § 381.413(j)(2) for relative claims, the percent (or fraction) that the cholesterol has been reduced, the identity of the reference food, and the quantitative information comparing the level of cholesterol in the product per labeled serving size with that of the reference food it replaces are declared in immediate proximity to the most prominent such claim as defined in § 381.413(j)(2)(ii).

(5) A comparative claim using the term "less" may be used on the label or in labeling of a product or a product that substitutes for that product as specified in § 381.413(d), including meal-type products as defined in § 381.413(l), provided that:

(i) For products that contain 11.5 grams or less of total fat per reference amount customarily consumed, per labeled serving size, and per 100 grams:

(A) The product contains at least 25 percent less cholesterol, with a minimum reduction of more than 20 milligrams per reference amount customarily consumed and per labeled serving size, from the reference food that it resembles and for which it substitutes as defined in § 381.413(j)(1) (i), (ii), and (iii).

(B) The product contains 2 grams or less of saturated fatty acids per reference amount customarily consumed and per labeled serving size; and

(C) As required in § 381.413(j)(2) for relative claims, the percent that the cholesterol was reduced, the identity of the reference food, and quantitative information comparing the level of cholesterol in the product per labeled serving size with that of the reference food are declared in immediate proximity to the most prominent such claim as defined in § 381.413(j)(2)(ii).

(ii) For products that contain more than 11.5 grams of total fat per reference amount customarily consumed, per labeled serving size, or per 100 grams of product:

(A) The product contains at least 25 percent less cholesterol with a minimum reduction of 20 milligrams per reference amount customarily consumed and per labeled serving size, from the reference food as defined in § 381.413(j)(1) (i), (ii), and (iii), that it resembles and for which it substitutes as specified in § 381.413(d) that has a significant market share (i.e., 5 percent or more);

(B) The product contains 2 grams or less of saturated fatty acids per reference amount customarily consumed and per labeled serving size; and

(C) The label or labeling discloses the level of total fat in a serving (as declared on the label) of the product. Such disclosure shall appear each time the claim is made, in immediate proximity to such claim preceding the referral statement required in § 381.413(g) in type that shall be no less than one-half the size of the type used for such claim. If the claim appears on more than one panel, the disclosure shall be made on each panel except for the panel that bears nutrition labeling. If the claim is made more than once on a panel, the disclosure shall be made in immediate proximity to the claim that is printed in the largest type; and 248 ¶

(D) As required in § 381.413(j)(2) for relative claims, the percent (or fraction) that the cholesterol was reduced, the identity of the reference food, and the quantitative information comparing the level of cholesterol in the product per label serving size with that of the reference food it replaces are declared in immediate proximity to the most prominent such claim as defined in § 381.413(j)(2)(ii) (e.g., "This turkey omelette contains 30 percent less cholesterol than our regular omelette. Cholesterol lowered from 45 milligrams to 30 milligrams per serving. Contains I2 grams of fat per serving.").

(e) *Lean and Extra Lean Claims.* (1) The term "lean" may be used on the label or in labeling of a poultry product, provided that the product contains less than 10.5 grams of fat, less than 3.5 grams of saturated fat, and less than 94.5 milligrams of cholesterol per 100 grams.

(2) The term "extra lean" may be used on the label or in labeling of a poultry product, provided that the product contains less than 4.9 grams of fat, less than l.8 grams of saturated fat, and less than 94.5 milligrams of cholesterol per 100 grams.

§§ 381.463–381.468 [Reserved]

§ 381.469 Petitions for nutrient content claims.

(a) This section pertains to petitions for claims, expressed or implied, that characterize the level of any nutrient required to be on the label or in labeling of product by this subpart.

(b) Petitions included in this section are (1) petitions for a new (heretofore unauthorized) nutrient content claim, (2) petitions for a synonymous term (i.e., one that is consistent with a term defined by regulation) for characterizing the level of a nutrient, and (3) petitions for the use of an implied claim in a brand name.

(c) Petitions to be filed under this section shall be submitted in quadruplicate. If any part of the material submitted is in a foreign language, it shall be accompanied by an accurate and complete English translation. The petition shall state the petitioner's post office address.

(d) Pertinent information may be incorporated in, and will be considered as part of, a petition on the basis of specific reference to such information submitted to and retained in the files of the Food Safety and Inspection Service. However, any reference to unpublished information furnished by a person other than the applicant will not be considered unless use of such information is authorized (with the understanding that such information may in whole or part be subject to release to the public) in a written statement signed by the person who submitted it. Any reference to published information should be accompanied by reprints or photostatic copies of such references.

(e) If nonclinical laboratory studies are included in a petition, the petition shall include, with respect to each nonclinical study contained in the petition, either a statement that the study has been, or will be, conducted in compliance with the good laboratory practice regulations as set forth in part 58 of chapter I, title 21, or, if any such study was not conducted in compliance with such regulations, a brief statement of the reason for the noncompliance.

(f) If clinical investigations are included, the petition shall include statements regarding each such clinical investigation relied upon in the petition that it either was conducted in compliance with the requirements for institutional review set forth in part 56 of chapter I, title 21, or was not subject to such requirements in accordance with § 56.194 or § 56.105, and that it was conducted in compliance with the requirements for informed consents set forth in part 50 of chapter I, title 21.

(g) The availability for public disclosure of petitions submitted to the agency under this section will be governed by the rules specified in subchapter D, title 9.

(h) The data specified under the several lettered headings should be submitted on separate sheets or sets of sheets, suitably identified. If such data have already been submitted with an earlier application from the petitioner, the present petition must provide the data.

(i) The petition must be signed by the petitioner or by his or her attorney or agent, or (if a corporation) by an authorized official.

(j) The petition shall include a statement signed by the person responsible for the petition, that to the best of his or her knowledge, it is a representative and balanced submission that includes unfavorable information, as well as favorable information, known to him or her pertinent to the evaluation of the petition.

(k) (1) Petitions for a new nutrient content claim shall include the following data and be submitted in the following form.

(Date)

Name of petitioner _____

Post-office address _____

Subject of the petition _____

FSIS Hearing Clerk, Regulations Development Unit, Policy Office, Food Safety and Inspection Service,
U.S. Department of Agriculture, Washington DC 20250.

Dear Sirs: The undersigned, _____ submits this petition pursuant to 9 CFR 381.469 with respect to (statement of the claim and its proposed use).

Attached hereto, in quadruplicate, and constituting a part of this petition, are the following:

A. A statement identifying the descriptive term and the nutrient that the term is intended to characterize with respect to the level of such nutrient. The statement should address why the use of the term as proposed will not be misleading. The statement should provide examples of the nutrient content claim as it will be used on labels or labeling, as well as the types of products on which the claim will be used. The statement shall also specify the level at which the nutrient must be present or what other conditions concerning the product must be met for the appropriate use of the term in labels or labeling, as well as any factors that would make the use of the term inappropriate.

B. A detailed explanation supported by any necessary data, of why use of the food component characterized by the claim is of importance in human nutrition by virtue of its presence or absence at the levels that such claim would describe. This explanation shall also state what nutritional benefit to the public will derive from use of the claim as proposed and why such benefit is not available through the use of existing terms defined by regulation. If the claim is intended for a specific group within the population, the analysis should specifically address nutritional needs of such group, and should include scientific data sufficient for such purpose. The petition should also include data and information, e.g., surveys to the extent necessary to demonstrate that consumers can be expected to understand the meaning of the term under the proposed conditions of use.

C. Analytical data that demonstrates the amount of the nutrient that is the subject of the claim, that is present in the products for which the claim is intended. The assays should be performed on representative samples using the Association of Official Analytical Chemists (AOAC) methods where available. If no AOAC method is available, the petitioner shall submit the assay method

used, and data establishing the validity of the method for assaying the nutrient in the particular food. The validation data should include a statistical analysis of the analytical and product variability.

D. A detailed analysis of the potential effect of the use of the proposed claim on food consumption, and any corresponding changes in nutrient intake. The latter item should specifically address the intake of nutrients that have beneficial and negative consequences in the total diet. If the claim is intended for a specific group within the population, the above analysis should specifically address the dietary practices of such group, and should include data sufficient to demonstrate that the dietary analysis is representative of such group.

Yours very truly,
Petitioner _____
By _____
(Indicate authority)

(2) Within 15 days of receipt of the petition, the petitioner will be notified by letter of the date on which the petition was received. Such notice will inform the petitioner (i) that the petition is undergoing Agency review and the petitioner will subsequently be notified of the Agency's decision to file or deny the petition; or (ii) that the petition is incomplete, e.g., one that lacks any of the data required by this section, one that states such data in a manner that is not readily understood, or one that has not been submitted in quadruplicate, in which case the petition will be denied and the petitioner will be notified as to what respect the petition is incomplete.

(3) Within 100 days of the date of receipt of the petition, the Administrator will notify the petitioner by letter that the petition has either been filed or denied. If denied, the notification shall state the reasons therefor. If filed, the date of the notification letter becomes the date of filing. A petition that has been denied shall not be made available to the public. A filed petition shall be available to the public as provided under paragraph (e) of this section.

(4) Within 90 days of the date of filing, the Administrator will, by letter of notification to the petitioner, (i) deny the petition, or (ii) inform the petitioner that a proposed regulation to provide for the requested use of the new term will be published in the **Federal Register**. The Administrator will publish the proposal to amend the regulations to provide for the requested use of the nutrient content claim in the **Federal Register** within 90 days of the date of filing. The proposal will also announce the availability of the petition for public disclosure.

(l)(1) Petitions for a synonymous term shall include the following data and be submitted in the following form.

_____
(Date)

Name of petitioner _____
Post-office address _____
Subject of the petition _____

FSIS Hearing Clerk, Regulations
Development Unit, Policy Office, Food
Safety and Inspection Service,
U.S. Department of Agriculture, Washington, DC 20250.

Dear Sirs: The undersigned, _____ submits this petition pursuant to 9 CFR 381.469 with respect to (statement of the synonymous term and its proposed use in a nutrient content claim that is consistent with an existing term that has been defined under subpart Y of this part).

Attached hereto, in quadruplicate, and constituting a part of this petition, are the following:

A. A statement identifying the synonymous descriptive term, the existing term defined by a regulation with which the synonymous term is claimed to be consistent, and the nutrient that the term is intended to characterize the level of. The statement should address why the use of the synonymous term as proposed will not be misleading. The statement should provide examples of the nutrient content claim as it will be used on labels or labeling, as well as the types of products on which the claim will be used. The statement shall also specify whether any limitations not applicable to the use of the defined term are intended to apply to the use of the synonymous term.

B. A detailed explanation supported by any necessary data, of why use of the proposed term is requested, including whether the existing defined term is inadequate for the purpose of effectively characterizing the level of a nutrient. This item shall also state what nutritional benefit to the public will derive from use of the claim as proposed, and why such benefit is not available through the use of existing term defined by regulation. If the claim is intended for a specific group within the population, the analysis should specifically address nutritional needs of such group, and should include scientific data sufficient for such purpose. This item shall also include data and information, e.g., surveys, to the extent necessary to demonstrate that consumers can be expected to understand the meaning of the term under the proposed conditions of use.

C. A detailed analysis of the potential effect of the use of the proposed claim on food consumption and any corresponding changes in nutrient intake. The latter item should specifically address the intake of nutrients that have beneficial and negative consequences in the total diet. If the claim is intended for a specific group within the population, the above analysis should specifically address the dietary practices of such group, and should include data sufficient to demonstrate that the dietary analysis is representative of such group.

Yours very truly,
Petitioner _____

(2) Within 15 days of receipt of the petition, the petitioner will be notified by letter of the date on which the petition was received. Such notice will inform the petitioner (i) that the petition is undergoing Agency review and the petitioner will subsequently be notified of the Agency's decision to grant the petitioner permission to use the proposed term or to deny the petition; or (ii) that the petition is incomplete, e.g., one that lacks any of the data required by this part, one that states such data in a manner that is not readily understood, or one that has not been submitted in quadruplicate, in which case the petition will be denied and the petitioner will be notified as to what respect the petition is incomplete.

(3) Within 90 days of the date of receipt of the petition that is accepted for review (i.e., that has not been found to be incomplete and subsequently denied), the Administrator will notify the petitioner by letter of the Agency's decision to grant the petitioner permission to use the proposed term, with any conditions or limitations on such use specified, or to deny the petition, in which case the letter shall state the reasons therefor. Failure of the petition to fully address the requirements of this section shall be grounds for denial of the petition.

(4) As soon as practicable following the granting of a petition, the Administrator will publish a notice in the **Federal Register** informing the public of his or her decision. If the petition is granted, the approved synonymous term will be included in the regulations listing terms permitted for use in nutrient content claims.

(m)(1) Petitions for the use of an implied nutrient content claim in a brand name shall include the following data and be submitted in the following form.

_____
(Date)

Name of petitioner _____
Post-office address _____
Subject of the petition _____

FSIS Hearing Clerk, Regulations
Development Unit, Policy Office, Food
Safety and Inspection Service,
U.S. Department of Agriculture, Washington DC 20250.

Dear Sirs: The undersigned, _____ submits this petition pursuant to 9 CFR 317.369 with respect to (statement of the implied nutrient content claim and its proposed use in a brand name).

Attached hereto, in quadruplicate, and constituting a part of this petition, are the following:

A. A statement identifying the implied nutrient content claim, the nutrient the claim is intended to characterize, the corresponding term for characterizing the level of such nutrient as defined by a regulation, and the brand name of which the implied claim is intended to be a part. The statement should

address why the use of the brand-name as proposed will not be misleading. The statement should provide examples of the types of products on which the brand name will appear. It should also include data showing that the actual level of the nutrient in the food would qualify the label of the product to bear the corresponding term defined by regulation. Assay methods used to determine the level of a nutrient should meet the requirements stated under petition format item C in paragraph (k)(1) of this section.

B. A detailed explanation supported by any necessary data, of why use of the proposed brand name is requested. This item shall also state what nutritional benefit to the public will derive from use of the brand name as proposed. If the branded product is intended for a specific group within the population, the analysis should specifically address nutritional needs of such group, and should include scientific data sufficient for such purpose.

C. A detailed analysis of the potential effect of the use of the proposed brand name on food consumption, and any corresponding changes in nutrient intake. The latter item should specifically address the effect on the intake of nutrients that have beneficial and negative consequences in the total diet. If the branded product is intended for a specific group within the population, the analysis should specifically address the dietary practices of such group, and should include data sufficient to demonstrate that the dietary analysis is representative of such group.

Yours very truly,
Petitioner _____
By _____

(2) Within 15 days of receipt of the petition, the petitioner will be notified by letter of the date on which the petition was received. Such notice will inform the petitioner (i) that the petition is undergoing Agency review or (ii) that the petition is incomplete, i.e., one that lacks any of the data required by this part, one that states such data in a manner that is not readily understood, or one that has not been submitted in quadruplicate, in which case the petition will be denied and the petitioner will be notified as to what respect the petition is incomplete.

(3) The Administrator will publish a notice of the petition in the Federal Register announcing its availability to the public and seeking comment on the petition. The petition shall be available to the public to the extent provided under paragraph (e) of this section. The notice shall allow 30 days for comments.

(4) Within 100 days of the date of receipt of the petition that is accepted for review (i.e., that has not been found to be incomplete and subsequently denied), the Administrator will (i) notify the petitioner by letter of the Agency's decision to grant the petitioner permission to use the proposed brand name if such use is not misleading, with any conditions or limitations on such use specified, or (ii) deny the petition, in which case the letter shall state the reasons therefor. Failure of the petition to fully address the requirements of this section shall be grounds for denial of the petition. Should the Administrator not notify the petitioner of his or her decision on the petition within 100 days, the petition shall be considered to be granted.

(5) As soon as practicable following the granting of a petition, the Administrator will publish a notice in the Federal Register informing the public of such fact.

§§ 381.470–381.479 [Reserved]

§ 381.480 Label statements relating to usefulness in reducing or maintaining body weight.

(a) *General requirements.* Any product that purports to be or is represented for special dietary use because of usefulness in reducing body weight shall bear:

(1) Nutrition labeling in conformity with § 381.409 Of this subpart, unless exempt under that section, and

(2) A conspicuous statement of the basis upon which the product claims to be of special dietary usefulness.

(b) *Nonnutritive ingredients.* (1) Any product subject to paragraph (a) of this section that achieves its special dietary usefulness by use of a nonnutritive ingredient (i.e., one not utilized in normal metabolism) shall bear on its label a statement that it contains a nonnutritive ingredient and the percentage by weight of the nonnutritive ingredient.

(2) A special dietary product may contain a nonnutritive sweetener or other ingredient only if the ingredient is safe for use in the product under the applicable law and regulations of this chapter. Any product that achieves its special dietary usefulness in reducing or maintaining body weight through the use of a nonnutritive sweetener shall bear on its label the statement required by paragraph (b)(1) of this section, but need not state the percentage by weight of the nonnutritive sweetener. If a nutritive sweetener(s) as well as nonnutritive sweetener(s) is added, the statement shall indicate the presence of both types of sweetener, e.g., "Sweetened with nutritive sweetener(s) and nonnutritive sweetener(s)."

(c) *"Low calorie" foods.* A product purporting to be "low calorie" must comply with the criteria set forth for such foods in § 381.460(b) (2) and (3).

(d) *"Reduced calorie" foods and other comparative claims.* A product purporting to be "reduced calorie" or otherwise containing fewer calories than a reference food must comply with the criteria set forth for such foods in § 381.460(b) (4) and (5).

§§ 381.481–381.499 [Reserved]

§ 381.500 Exemption from nutrition labeling.

Poultry products used for further processing shall be exempt from nutrition labeling, provided that the labels for these products bear no nutrition claims or nutrition information.

Done at Washington, DC, on October 31, 1991.

Ronald J. Prucha,

Acting Administrator, Food Safety and Inspection Service.

Preliminary Regulatory Impact Analysis of Proposed Regulations for Nutrition Labeling of Meat and Poultry Products

I. Introduction

A. Purpose

This analysis is a Preliminary Regulatory Impact Analysis (PRIA) prepared in compliance with the provisions of Executive Order 12291 and the analysis requirement of the Regulatory Flexibility Act (Pub. L. 96–354) dealing with impacts of regulation on small entities. The analysis also includes a Takings Analysis as required by Executive Order 12630. The analysis examines costs, benefits and economic impacts associated with proposed rules for nutrition labeling of meat and poultry products.

As this preliminary analysis will show, the Agency believes that the potential health benefits are substantial and justify the costs that will be incurred. Because of the preliminary nature of this analysis and the magnitude of the costs and benefits involved, FSIS requests that all interested parties, including meat and poultry processors, food retailers, trade associations, health professionals, consumers, etc., submit any additional information regarding the validity of the cost or benefit estimates included in this analysis. FSIS plans to publish a supplement to this PRIA for public comment within 60 days of this proposal. The Agency is particularly interested in receiving early comments on this original PRIA and on the alternatives considered to facilitate formulation of the supplement to the PRIA. FSIS is especially interested in the following questions:

1. What would be the expected percent of meat and poultry products with nutrition labeling under the voluntary section of the various labeling alternatives?

2. What evidence is there that consumers who do not read labels consume less nutritious food because they can no longer

use the mere existence of a label as a convenient and efficient signal of nutritional quality? What health benefits would consumers gain under the various voluntary labeling alternatives?

3. What changes would be expected in the formulation of foods under a mandatory program? That is, to what extent would producers be expected to reformulate products to make them more attractive (from a nutrition standpoint) under a mandatory program?

4. How would market share of currently unlabeled and labeled foods change under a mandatory program?

5. What shifts in consumption patterns would occur between food groups under a mandatory nutrition labeling program?

6. What costs are associated with the prior label approval process? Specifically, does data exist on the length of time it takes to bring a product to market relative to a system where prior approval is not required?

The final RIA will incorporate all comments received on the relative costs and benefits of the proposed rule. FSIS will then consider the conclusions of the final RIA in developing any subsequent final rules based on this proposal.

B. Description of the Proposed Action

The proposed action would permit voluntary nutrition labeling on single-ingredient, raw meat and poultry products and require nutrition labeling for all other meat and poultry products, with the exception of products used for further processing. Under the mandatory nutrition labeling program, small packages and products packaged in other than consumer size packages would have the option of providing nutrition labeling information either on the package or by alternate means. This proposed action applies to products prepared and packaged under Federal or State-inspection programs and products imported into the United States.

As this analysis is being published in its entirety as an appendix to the proposal, a detailed description of the proposed action has not been included herein. The analysis uses the term "processed products" to refer to meat and poultry products that have undergone some manufacturing process such that they are no longer single-ingredient, raw meat and poultry products. The term "fresh" product is used interchangeably with "single-ingredient, raw" product.

C. Need for Federal Regulatory Intervention

As part of the 1990–1991 Regulatory Program, OMB has provided guidance on preparing regulatory impact analyses.[1] That guidance stresses the need to identify the market failure that establishes the potential need for the proposal. One type of market failure is inadequate information. The Regulatory Program provides the following guidance on addressing market failures due to inadequate information.

- Where market failure due to inadequate information is the rationale for government intervention, a regulatory action to improve the availability of information will ordinarily be the preferred alternative.
- Because the current state of knowledge about the economics of information is not highly developed, regulatory intervention to address an information problem should only be undertaken where there is substantial reason to believe that private incentives to provide information are seriously inadequate and that the specific regulatory intervention proposed will provide net benefits for society.

Based on the OMB guidance, FSIS identified four points that need to be addressed in an analysis of a market failure due to inadequate information. These are:

- Identify Market Failure.
- Identity Reason to Believe Private Incentives Inadequate.
- Select Action to Improve Availability of Information.
- Show That Proposed Action Provides Net Benefits.

1. Identification of Market Failure

For this regulatory action the market refers to the supply and demand for nutrition information on the labels of meat and poultry products. Consumer research shows a high and growing demand for nutrition information. For example, in the recent Health and Diet Survey, 74 percent of respondents answered "yes" when asked if they pay attention to nutrition information on labels.[2] Yet, only an estimated 35 to 50 percent of processed meat and poultry products have any nutrition labeling. The Department has concluded that the demand for nutrition labeling exceeds the availability, clearly indicating a market failure.

The market for nutrition information is not a market where consumers can determine the existence of a desired characteristic by inspection of the product before purchase or by use of the product after purchase. It is not a market where consumers can send clear signals to manufacturers through their purchase decisions. Factors such as price and taste obscure the message. The following anecdotal evidence illustrates the current inefficiency in the market for nutrition labeling information:

A large processor that has consistently provided nutrition labeling distributed a new product line without a nutrition panel. Based on the volume of consumer letters and phone calls, they modified their labeling to include a nutrition panel. The costs of modifying the labeling and the costs associated with consumer letters and calls are all costs that can be attributed to the inefficiency in the market for nutrition information.

In economic terms, the costs described above provide evidence of a market with high transaction costs. If transaction costs were zero, consumers would simply identify the level of nutrition information desired and food manufacturers would provide it. Thus, high transaction costs are characteristic of markets where clear communication is difficult. An obvious question to ask is: What will the Nutrition Labeling and Education Act (NFEA) of 1990 do to the transaction costs in the market for nutrition information?

The Department has concluded that there must be harmonization of nutrition labeling between USDA and the Food and Drug Administration (FDA). Different policies will decrease consumer understanding and add to the transaction costs that are already high. This position is supported by public comments responding to the Department's Advance Notice of Proposed Rulemaking (ANPR) on nutrition labeling. For example, a large association stated that harmony with FDA requirements "would prevent unnecessary confusion for the consumer and simultaneously, would minimize the burden of compliance with two different sets of requirements for the food processor. It would further enhance consumer education efforts, * * *" While the exact number of companies that manufacture both USDA and FDA-regulated foods is unknown, it is probably well over a thousand just based on the number of companies that produced items such as soup, frozen pizza, entrees or complete meals. With respect to the comment on consumer education efforts, the Department believes that harmonization is very important for efficient nutrition education programs.

2. Reason Private Incentives Are Inadequate

As identified above, an estimated 35 to 50 percent of processed meat and poultry products have some nutrition labeling. There is reason to believe that private incentives have gone as far as they will go. There is some evidence that voluntary nutrition labeling may have reached a plateau. As the OMB guidance referred to earlier points out, "Sellers are least likely to supply adequate information about a particular characteristic of their product where the characteristic is negatively valued by consumers * * *".

The recent survey of 1,600 products by Public Voice for Food and Health Policy[3] showed that for many product categories, the lower fat and lower caloric products showed higher levels of nutrition labeling. One could argue that there is less nutrition labeling on the products where it is needed most. The Department is not implying that this is a uniform practice, because there are companies that have made the corporate decision to provide nutrition labeling on all products, regardless of nutrient content. The point is that the voluntary program has lower participation for products that have higher levels of the more negatively valued characteristics and there is minimal private incentive for this to change.

3. Action to Improve Availability of Information

The proposed action will require that nutrition information appear on the packages (except very small packages) of processed meat and poultry products that are packaged in consumer-sized packages for sale in retail stores directly to household consumers. This action will provide nutrition information for an estimated 50 to 65 percent of such

[3] LEAN ON LABELS: A Survey of Meat and Poultry Products in Today's Marketplace, Public Voice for Food and Health Policy, March 1991.

products that currently are not nutrition labeled. The proposed action will also require that nutrition information be provided with products packaged in bulk for the HRI (hotels, restaurants, and institutions) trade.

4. Show That the Action Provides Net Benefits

Based on the analysis presented in this PRIA, FSIS estimates that the 20-year benefits for the proposed rule are at least $2.0 billion. For the same time period the costs will be $1.3 billion or less, depending on the time allowed for companies to comply with the rule and the availability of data bases to reduce analytical testing costs.

II. Regulatory Options/Summary of Costs and Benefits

A. Introduction

This chapter describes alternatives for providing nutrition information on product labels and provides an overview of the general costs and benefits associated with each alternative.

The alternatives identified focus on improving the availability of information, as opposed to more traditional "command-and-control" forms of regulation. An example of a "command-and-control" option to address the market failure for nutrition information would be standards setting limits for fat, saturated fat, cholesterol, etc., for different categories of meat and poultry products. Requiring nutrition labeling does not restrict product innovation, preserves freedom of choice, does not require any reformulation, and, therefore, should be a less costly regulatory approach than setting of standards.

Research initiated by the former U.S. Regulatory Council [4] cited three advantages of a market oriented approach such as information disclosure:

- Preserves freedom of choice for firms and consumers;
- Is likely to be a less costly remedy to the regulatory problem;
- Impinges less on competition and innovation.

B. Further Issues

Several further issues could be considered in conjunction with all of the options and will be included in the amended RIA during the comment period. The costs of transition included the loss of label inventories and the development of new labels beyond those already considered in this analysis. These costs could be reduced by grandfathering existing labels, although such an action would increase consumer confusion.

A second issue for further consideration is the possibility of allowing some variation in label formats. As in the case of grandfathering, variations would reduce compliance costs, but possibly increase consumer confusion and reduce health benefits.

A third issue is the possibility of dropping or revising prior label approval, now required by FSIS. With the increase in the number of labels expected under mandatory labeling for processed products, prior approval would either increase administrative costs or, if FSIS resources were not increased, result in delays in approving new labels.

C. Options

Five options were considered for the Preliminary Regulatory Impact Analysis.

- Current Program/Status Quo
- Voluntary Program Consistent with FDA
- Voluntary Program with Incentives
- Mandatory/Voluntary Approach
- Mandatory Nutrition Labeling for all Products

Discussions of each option follow.

1. Current Program/Status Quo

This option is provided to serve as a baseline for considering the other options. The "status quo" option implies no regulatory action. Under this alternative, nutrition labeling would continue to be regulated as it is currently: nutrition labeling is voluntary unless the product label makes a specific nutrition claim, in which case nutrition labeling becomes necessary. The information to be provided on the labels would remain the same as under the current program, and labels would be approved using the same criteria currently in use.

Under the current program, firms may choose between two types of nutrition labels. A detailed label, containmg nutrition information, in the format and style provided by the existing FDA regulations, or an abbreviated format that includes only calories, protein, carbohydrates, and fat per serving of the product. Labels are approved in conjunction with a Nutrition Labeling Verification (NLV) program. FSIS estimates that between 35 and 50 percent of the existing processed meat and poultry products carry nutrition labeling at the present time. (This chapter will use a point estimate of 40 percent to simplify the presentation.)

FDA is in the process of modifying its existing regulations, in accordance with the NLEA. FSIS will have to revise existing policies that make references to FDA regulations.

Although costs and benefits are not usually associated with a "status quo" option, in this case, a number of costs become apparent. The presence of two labeling schemes, three counting the abbreviated format, could confuse consumers and would complicate both the market for nutrition information and existing nutrition education programs. In fact, consumer confusion might even offset some of the health benefits associated with the new nutrition labeling efforts by FDA. In addition, although the status quo option imposes no direct costs on the meat and poultry industry, there are associated administrative costs for firms that produce both FDA-regulated and USDA-regulated products. These firms would have to maintain two different label schemes, with different formats and different nutrient requirements. For some firms, these may be important costs, and may lead some firms to drop out of the voluntary nutrition labeling program for USDA-regulated products. A final cost—and one which would be difficult to quantify—would be loss of confidence by the public in USDA's ability or interest in providing nutrition education.

PRO

- The current program is voluntary, so the benefits to participants can be presumed to exceed their costs.

CON

- Under a voluntary program, products containing large amounts of fat, saturated fat, cholesterol, or sodium are less likely to be labeled. Consumers will make choices they would not make under mandatory labeling.
- Firms which now produce and label USDA-regulated and FDA-regulated products would bear administrative costs associated with maintaining two labeling schemes. For some firms, this might lead to the decision to abandon voluntary nutrition labeling for USDA-regulated products.
- Different labeling schemes would confuse consumers and complicate the market for nutrition information.
- Consumers could lose confidence in USDA's ability or interest in providing nutrition information.

2. Voluntary Labeling, Consistent With FDA

Second option is a voluntary program consistent with the regulations that FDA will publish to implement the NLEA. FSIS would issue rules requiring that all firms that wish to voluntarily provide nutrition information on labels of either fresh or processed meat and poultry products, do so in the manner prescribed by FDA to implement the NLEA.

This option avoids the confusion and multiple labeling schemes that would result from maintaining the status quo. Complying with the new label requirements would increase costs to firms and is likely to reduce the percent of products labeled below the estimated 40 percent currently. The situation is summarized in Table 1.

[4] Information Disclosure, A Practical Guide to the Use of Information Disclosure as a Regulatory Alternative, Project on Alternative Regulatory Approaches, Administrative Conference of the United States, September 1981.

TABLE 1.—BENEFITS AND COSTS OF ALTERNATIVE OPTIONS (RELATIVE TO STATUS QUO) [1]

	Voluntary labeling of all meat and poultry products, consistent with FDA		Voluntary labeling for raw products, mandatory for processed, consistent with FDA	
	6 Months [2]	24 Months [2]	6 Months [2]	24 Months [2]
Manufacturers' Costs (billion dollars)	≤.52	≤.39	1.28	0.97
Health Benefits (billion dollars)	Small	Small	2.0	1.8
Percent of Processed Products Labeled on Final Implementation Date	≤40	≤40	100	100
Benefit/Cost	Uncertain	Uncertain	1.5	1.9

[1] This table contains tentative estimates to be refined in the supplemental PRIA discussed at the beginning of this PRIA.
[2] Time to comply.

A first estimate of compliance costs for voluntary labeling, consistent with FDA is $390 to $520 million depending on whether the time for compliance is lengthened from 6 to 24 months. (This estimated range is based on the estimated costs of $968 million and $1.28 billion for a voluntary/mandatory program with a compliance period of 24 and 6 months, respectively. These cost estimates are developed in detail in the remainder of this impact analysis. The costs presented here are 40 percent of the estimates for the voluntary/mandatory program.) However, taking into account the probable reduction in labeled products, the cost would be expected to be less.

The cost would be less for a second reason also. Because companies already test the voluntary-labeled products for some nutrients and food components, the costs would most likely be less than 40 percent of the total cost of mandatory nutrition labeling for all processed products.

Under the proposed rule, most processed meat and poultry products opting for nutrition labeling would be required to disclose the following: Total calories, Calories from fat, Protein, Saturated fat, Iron, Total fat, Total carbohydrates, Sodium, Cholesterol, Calcium.

Presumably many voluntary-labeled meat and poultry products are not analyzed for the nutrients or food components not currently included on the labels. This option would, therefore, impose substantial analytical costs on firms that would choose to continue using nutrition labeling on a voluntary basis.

Benefits of a totally voluntary program are a result of two counteracting forces, the increase in health benefits from more complete labeling of some products consistent with FDA and the increase in health costs from consumers' unknowing consumption of nutrients they would have avoided if there were no reduction in the number of labeled products. Thus, the benefits become uncertain under voluntary program. Although Table 1 shows the benefit/cost ratio to be uncertain, the counteracting forces may keep benefits below the costs.

PRO

- Products with nutrition labels whether FDA- or USDA-regulated, would be consistent, thereby reinforcing information received by consumers.
- More nutrition information would be available to consumer on those products that continue to be labeled.

CON

- Under a voluntary program, products containing large amounts of fat, cholesterol, and sodium would continue to be less likely to be labeled, as under the current program, thus leading consumers to make choices they would not make under mandatory labeling. Even if consumers assumed that unlabeled products contained more of nutrients whose consumption they wished to reduce, they would not know which nutrient(s) was (were) present in large amounts in an unlabeled product.

Furthermore, it is not clear that consumers equate lack of labeling with nutrients whose consumption they wish to reduce. Research focusing on educated women, assuming education is a proxy for acquisition of available nutrition knowledge, found that as nutrition information became more prevalent the women reduced red meat consumption to avoid fat. However, they substituted other high-fat foods, such as cheese and salad oils, apparently unaware of the fat content of mixtures, such as salads, which contained the high-fat foods. Their total fat intake remained unchanged.[5]

- The increased costs of compliance compared to the current situation could reduce the percent of products labeled below the current estimate of 40 percent. The reduction in labeled products could have negative health benefits, as consumers made choices they would not make if fully informed.
- Positive health benefits associated with increased information on labels might be offset by higher health costs from these uninformed choices due to reduced availability of labeled products.

3. Voluntary Program consistent with FDA, with Compliance Incentives

This option modifies the voluntary program, which requires labeling, if voluntarily chosen, to be consistent with the FDA format. The option would attempt to ameliorate the disadvantage of those options by offering technical assistance, free or subsidized product analysis to small businesses, possibly centrally printed standardized forms, or other positive incentives. The costs of these incentives and the projected industry response will be included in an amendment to the RIA during the comment period.

PRO

- Reduction in compliance costs would limit the reduction in labeled products expected under the voluntary program without incentives
- Centrally monitored and/or implemented activities might be more efficient and reduce duplication, compared with costs incurred by numerous small and/or medium-sized companies under both voluntary labeling without incentives and mandatory labeling.

CON

- Compared with the option for mandatory labeling for processed products, this option would not likely result in all processed meat and poultry products being labeled.
- Compared with mandatory labeling, the fewer labeled products would still result in uninformed consumer choices, probably continued excess consumption of nutrients associated with cancer and heart disease, and therefore, more early deaths.

4. Voluntary Labeling for Raw Products, Mandatory Labeling for Processed Products

This option is the tentative position outlined by FSIS in the Advance Notice of Proposed Rulemaking (ANPR) published on April 2, 1991. That option consists of a mandatory nutrition labeling program for processed meat and poultry products and a voluntary approach for single-ingredient, raw meat and poultry products. Processed products shipped to other establishments for use as ingredients would not be covered by the mandatory program. Raw products using nutrition labeling on a voluntary basis would have to comply with all applicable requirements. The program would apply to the products packaged in federally or State inspected establishments or imported already packaged and labeled for retail sale.

The benefits, discussed in detail in chapter III, are estimated at $2.0 billion over a 20-year period. Benefits are based on an estimate of how consumers will change their food consumption when provided with additional nutrition label information. Changes in dietary intake were used to estimate public health benefits in terms of reduced cancer and coronary heart disease. The model used to estimate benefits did not account for benefits that could result from decreased rates of osteoporosis, obesity, hypertension, etc. As consumers are given more informative labeling in a better format, uncertainty over

[5] Daniel Putler and Elizabeth Frazao, "Diet/Health Concerns About Fat Intake," *Food Review*, Economic Research Service, USDA, January-March, 1991.

the ingredient and nutrient content of the foods they now eat will decrease, and some consumers will select more nutritious, healthier foods.

The main advantages of this program would be widespread, consistent and uniform information provided to consumers on labels and the resulting health benefits from improved diets. The program would, of course, cost manufacturers more than a voluntary program.

PRO

- Consumers face uniform labels on all labeled food products.
- Widespread, uniform labels would allow consumers to reduce excess consumption of nutrients associated with coronary heart disease, breast cancer, prostate cancer, and colon/rectum cancer and consequently avoid early deaths from those diseases.
- Health benefits are estimated to be $1.8 to $2.0 billion and exceed compliance costs by $700 to $800 million depending upon whether the time for compliance is lengthened from 6 months to 2 years.
- Mandatory labeling would probably lead to product reformulation, with additional health benefits even among consumers who might not read labels.

CON

- Manufacturers would pay higher costs or analyzing and labeling additional products.
- The large number of labels required under this option would make prior label approval severely restraining, unless it were significantly streamlined.

5. Mandatory Labeling of All Meat and Poultry Products

This option raises the question of development of nutrition data for raw commodities by individual firms versus that development by single program supported jointly by USDA and the commodity industry. Preparation of materials in a single location is more efficient. Furthermore, FSIS wants it regulatory option to encourage centrally supported nutrition research on the agricultural commodities such as beef, pork, chicken, and turkey. Therefore, it does not favor this option.

Currently, there are central programs to provide point-of-purchase nutrition information for fresh meat and poultry products using USDA Handbook No. 8 data.

This meat Nutri-Facts program was developed as a cooperative effort of the American Meat Institute, the Food Marketing Institute, and the National Livestock and Meat Board. The program was developed to provide consumers, retailers, and industry with information about red meat and nutrition. A key component of the program is the Meat Nutri-Facts manual, which, among other information, provides camera-ready copy of a variety of in-store nutrition information materials. These materials all use data from USDA Handbook No. 8. The cost of the project was approximately $300 to $350 thousand for market research, artwork and preparation of camera ready copy. In using these point-of-purchase materials, each store would be responsible for printing costs. FDA has estimated that there are 99,000 retail stores that fall under the compliance guidelines of the NLEA. If printing costs averaged $500 for all these stores, then the cost of voluntary nutrition labeling of fresh meat products would be approximately $50 million each time the materials had to be replaced.

A similar program for poultry, Poultry Nutri-Facts, was developed by the Food Marketing Institute, the National Broiler Council, and the National Turkey Federation. Both the meat and poultry manuals also provide nutrition information for a variety of recipes using fresh cuts as ingredients. It is the Department's understanding that these manuals will be updated to harmonize with the FDA regulations issued to implement the NLEA

Given the fact that FSIS expects most nutrition data for fresh products to come from Handbook No. 8, it would be far more efficient for one source to develop the materials than for processors who packages fresh product to develop their own artwork and labeling materials. This is, centrally-developed, point-of-purchase materials should cost far less than individually developed labels.

Probably the largest cost saving initiative is the ongoing research to determine the physical and chemical composition of frequently retailed fresh cuts. Because much of Handbook No. 8 is outdated, USDA encourages and cooperates with private sector studies to update data on the composition of fresh cuts. For example, a recent study on the composition and marketing of pork products at retail [6] was supported, in part, by the National Pork Board through the Pork Industry Group of the National Livestock and Meat Board, and in cooperation with the Agricultural Research Service and the Human Nutrition Information Service of USDA.

A similar study related to beef [7] was supported by the Agricultural Research Service, USDA, the Cattlemen's Beef Promotion and Research Board, the National Cattlemen's Association, and the Beef Industry Council of the National Livestock and Meat Board.

PRO

- All labels for fresh and processed meat and poultry products would provide nutrition information.
- Health benefits would be higher than under voluntary programs.

CON

- Costs of having individual firms develop their own nutrition labeling for fresh commodities would be higher than if labeling materials were prepared in a central location.
- Higher compliance costs could be passed on to consumers.

III. Health Benefits

A. Overview

In examining the public comments on the ANPR and other sources of information that discuss the potential benefits of nutrition labeling, FSIS found that benefits have been articulated in varying ways, frequently in terms of the confusion that will occur if the Department of Agriculture does not adopt rules consistent with those that will be promulgated by FDA to implement the NLEA. The following are typical of comments that are directed at identifying the benefits of the proposed rule.

- Nutrition labeling provides consumers with information to make more informed choices when purchasing food products.
- Additional nutrition labels will decrease consumer uncertainty about the nutrient content of foods, allowing consumers to make more informed food purchase decisions.
- If meat products do not have nutrition labels, consumers will mistakenly avoid an important source of iron in their diet.
- If all foods are not nutrition labeled, consumers will make purchases that will negate the benefits from selectively purchasing foods with nutrition labels.
- If labeling is not consistent, the added confusion will detract from the potential benefits.
- If nutrient content information was available on all food, there would be less of the good food-bad food rhetoric that adds to confusion.

All of the above statements relate directly or indirectly to the issue of how nutrient information on labels will affect purchase and consumption behavior. They all relate to the usefulness or effectiveness of nutrition labeling, where effectiveness would be measured in terms of how purchase decisions change. Thus, for the most part, the general benefit statements eventually relate to dietary change which should be quantifiable in health benefits.

It could be argued that some consumers would place a value or benefit directly on improved information even if they chose not to change behavior. In other words, there may be some willingness-to-pay for improved nutrition labeling for more informed choices even if consumers don't plan to use the information to change their diet. However, for the purposes of this analysis, the benefits of the proposed rule are viewed as the public health benefits that result when consumers change eating patterns as a result of having additional nutrition information.

The discussion of separate benefits for USDA-regulated and FDA-regulated foods tends to imply that benefits can be related to the proportion of food labeled with nutrition information. However, there is strong support for a viewpoint that there really is a single benefit analysis and that the potential benefits are not linearly related to the coverage of food, but will be greatly enhanced by the consistent labeling of all food.

For the purpose of estimating public health benefits, this PRIA draws heavily on the work [8] conducted by the Center for

[8] Estimating the Benefits of Nutrition Label Changes. Research Triangle Institute, April 1991.

Economics Research, Research Triangle Institute (RTI) for the Food and Drug Administration. A key analytical tool utilized by RTI was the Browner health effects model. The Browner model is a computer simulation model developed for the Department of Health and Human Services by Dr. Warren Browner and associates at the Institute for Health Policy Studies, University of California at San Francisco. The model estimates the impact of changes in dietary intake of total fat, saturated fat, and cholesterol on the incidence and mortality of four diseases—coronary heart disease (CHD), breast cancer, prostate cancer, and colon/rectum cancer.

The Department has not conducted an independent evaluation of the analysis performed by RTI. Their final report presented to FDA discusses the important assumptions and limitations of the work. The Department believes that everyone involved in the FDA/RTI study should be commended for their efforts in advancing the methodology available for estimating public health benefits of nutrition label changes. The fact that the study was done will make an important contribution to the national debate on the cost and benefits of nutrition label changes.

B. Scenarios Analyzed

The inputs for the Browner model are changes in nutrient intakes. To develop alternative inputs, the FDA/RTI study developed different scenarios that describe how consumers might change their diet in response to changes in the availability of nutrient content information. The starting point or baseline data for the scenarios is an estimate of the excess fat, saturated fat and cholesterol in the diet of U.S. consumers. The estimated excess was developed comparing data from the 1987–1988 Nationwide Food Consumption Survey (NFCS) and the daily reference values (DRVs) for fat, saturated fat and cholesterol. The DRVs are recommended dietary levels being proposed by FDA for fat, fatty acids, cholesterol, carbohydrate, fiber, sodium and potassium. Table 2 shows the estimated average dietary change necessary for consumers to meet the DRVs.

TABLE 2.—PERCENTAGE REDUCTION REQUIRED IN NUTRIENT INTAKE NECESSARY TO MEET DRVS

Food component	Men	Women
Fat	20.1	18.5
Saturated Fat	25.1	24.0
Cholesterol	13.5	None*

*Women's average daily intake of cholesterol was below the daily reference value.

The first scenario assumed that all consumers are willing and able to achieve the DRVs for fat, saturated fat and cholesterol, i.e., the average consumer would reduce fat and cholesterol intake by the percentages shown in Table 2. This response to mandatory nutrition labeling provides an upper bound for the public health benefits. The FDA analysis refers to this as the "perfect diet" scenario. A second scenario reduced the Table 2 values by the percentage of total dietary fat and cholesterol attributable to meat and poultry products (Table 3).

TABLE 3.—PERCENTAGE OF DIETARY FAT AND CHOLESTEROL ATTRIBUTABLE TO MEAT AND POULTRY PRODUCTS

Food component	Men	Women
Fat	33.1 (32.4)	29.7 (30.1)
Saturated Fat	33.1 (32.1)	29.2 (29.5)
Cholesterol	38.0 (40.7)	37.1 (39.7)

*The percentages not in parentheses are from the FDA/RTI Study. The values in parentheses are from data provided to FSIS by HNIS for men and women 19 and older.

Thus, in the second scenario men would reduce their total fat intake by 13.5 percent which is the level of 20.1 percent from Table 2 reduced by 33.1 percent from Table 3. The second scenario assumed that consumers would reduce fat and cholesterol intake from FDA-regulated foods by Table 1 percentages, but consumption of meat and poultry products would remain unchanged because the NLEA covered only FDA-regulated products.

It is important to distinguish between the NFCS category of meat and poultry and the category of all USDA-regulated meat and poultry products. The NFCS category for meat and poultry does not include products such as soup or pizza where the primary ingredient is not meat or poultry. The conclusion is that USDA-regulated products probably account for a substantially greater percentage of fat and cholesterol than indicated by the data in Table 3.

FSIS is aware that there has been considerable criticism of the 1987–1988 NFCS, primarily focused on the response rate of 35 percent. This is not a concern in using the data for a general estimate on sources of fat. Data from 1985 show similar findings, i.e., meat and poultry accounted for 30.6 percent of total fat and 38.8 percent of saturated fat in the U.S. Food Supply.[9]

Because the effectiveness of nutrition labeling has been related to percentage of food covered, it may be important to consider the proportion of fat and cholesterol that is consumed through products covered by the proposed rule, i.e. retail sales of processed products in consumer-sized packages. FSIS examined available data on source of total fat from meat and poultry broken down by the categories of fresh product versus processed product and retail purchases (consumed at home) versus eating out.

This preliminary analysis found more data available on the issue of retail sales versus HRI sales than on the source of fat. A recent report by ERS [10] showed that retail sales represented 55 percent of total food sales in 1989. Total retail food sales were $276 billion (55 percent) while food service sales were $223 billion (45 percent). In 1982, food consumed away from home accounted for 37 percent of all dollars spent on food, up from 33 percent in 1970.[11] These data show a clear trend for increased consumption away from home.

The National Broiler Council conducts a biannual survey of broiler industry marketing practices. Their report [12] on 1989 data estimated that 60.3 percent of product for the domestic food market was distributed to retail grocery stores and 39.7 percent to public eating places, institutions, or government procurement programs, etc. While their study addresses primarily fresh products it also includes some further processed products such as nuggets and patties. Similar data from their 1981 survey showed that 68.5 percent of product was distributed to retail stores, indicating that the proportion of poultry consumed outside the home is increasing.

The analysis did not find any data that could address the question concerning the specific amount of dietary fat from USDA-regulated products covered by the proposed rule. HNIS provided data from the NFCS survey showing that meat and poultry products contribute a higher percentage of fat and cholesterol for food eaten at home than for food eaten away from home. This suggests that meat and poultry products account for a higher proportion of fat in retail sales. After examining the data on sources of fat from meat and poultry products, FSIS concluded that the second scenario from the FDA/RTI study would have to be modified to reflect retail sales of processed products if the second scenario was selected to estimate public health benefits.

A third scenario in the FDA/RTI study reduced health benefits by an additional 55 percent, based on an estimate that only 45 percent of consumers are (1) aware of the diet-health relationship, (2) read and understand labels and (3) will use nutrition labels to change their nutrient intakes after new mandatory labeling regulations are implemented

The last scenario developed by RTI was an estimate of consumer response based on fundings from a program conducted by FDA in conjunction with Giant Food, Incorporated. That study, referred to as the "Special Dietary Alert" (SDA), used special shelf labels to call consumers' attention to various nutrient descriptors of food. For example, a flag may have called attention to a product that qualified under FDA guidelines as being "low cholesterol." In addition, a guidebook was offered either free or at nominal charge. Using the SDA data, RTI extrapolated the findings to develop an estimate of dietary change for the population. That estimate is shown in Table 4.

TABLE 4.—ESTIMATED PERCENTAGE REDUCTION IN NUTRIENT INTAKE BASED ON SPECIAL DIET ALERT

Food component	Men	Women
Fat	1.4	1.1
Saturated Fat	1.3	0.7
Cholesterol	0.1	0.1

C. Estimates of Health Benefits

The scenarios developed by RTI to estimate changes in nutrient intakes from FDA-regulated foods also provide a framework for discussing the potential benefits from changing nutrient intakes from meat and poultry products. The first FDA/RTI scenario assumed that all consumers would reduce their intake of fat and cholesterol from all food groups by the percentages shown in Table 2. That is, consumers would have nutrition information available for both FDA-regulated and USDA-regulated foods and would modify their diet in order to meet the DRVs for fat and cholesterol. (The changes in fat and cholesterol intake are assumed to start one year after the promulgation of regulations and to last indefinitely.) The resulting estimated benefits are shown below in Table 5.

Table 5.—Maximum Health Benefits From Diet Improvement Over 20 Years

Cases of CHD and Cancer Avoided	725,155
Deaths Avoided	308,366
Life-Years Gained	2,280,549

Table 5 shows the maximum possible benefits from dietary changes of all foods U.S. consumers eat. In this "perfect diet" scenario, the benefits attributable to meat and poultry products are shown in Table 6 below.

Table 6.—Maximum Health Benefits From Diet Changes Meat and Poultry Products—20 Years

Cases of Cancer and CHD Avoided	221,707
Deaths Avoided	95,770
Life-Years Gained	715,199

Attributing the Table 6 benefits to meat and poultry assumes a proportional reduction in fat and cholesterol across all food categories. As shown in Table 3 above, meat and poultry represent 33 percent of total fat intake for men and 30 percent for women, and this consumption is assumed to remain unchanged. Thus, in the "perfect diet" scenario, 33 percent of the dietary fat reduction for men and 30 percent of the dietary fat reduction for women will result from changes in meat and poultry consumption.

To correspond to the third scenario of the FDA/RTI study, the benefits in the above table for meat and poultry were reduced by 55 percent based on the estimate that 45 percent of consumers are aware of labels, read labels and understand the information provided. The resulting benefits are shown in Table 7.

Table 7.—Health Benefits from Diet Improvement Over 20 Years—45 Percent Response

Cases of CHD and Cancer Avoided	99,768
Deaths Avoided	43,097
Life-Years Gained	321,840

Using the scenario based on estimates derived from the Special Dietary Alert program the estimated benefits attributable to meat and poultry products are shown in Table 7.

Table 8.—Health Benefits from Diet Improvement Over 20 Years

Cases of CHD and Cancer Avoided	17,260
Deaths Avoided	5,818
Life-Years Gained	37,012

The Table 8 benefits represent the best available estimate for the benefits of the proposed rule. These estimates are derived from a study that measured actual consumer response to new nutrition information. In using the analogous estimate of benefits for FDA-regulated foods, the FDA regulatory analysis [13] identifies several factors that would lead one to conclude that the estimates are high but also several factors that would lead one to conclude that the estimates are low. Obviously, the actual change in consumer behavior due to the additional nutrient labeling is a key variable. The estimate based on the SDA is used because it is an extrapolation from some limited but actual consumer response data.

In order to facilitate the comparison of costs and benefits, the health benefits, e.g., life-years gained will be valued in dollars. Recognizing that there are different methodologies for assigning dollar values to diseases avoided and life-years gained, this analysis has chosen to use the methodology selected by RTI in their work for FDA. Using the RTI methodology, the medical care cost savings (discounted at 5 percent) [14] are estimated at $258 million. Avoided medical care costs undervalue the true benefits of a health care regulation because they do not include productivity losses or pain and suffering losses. On the other hand, the figures presented here overstate the true reduction in such costs as the costs of competing illnesses are not subtracted. That is, even though cancer or CHD may be avoided another disease may occur such that only net savings should be reported.

In their study, RTI used an estimated value of life of $1,500,000 derived from wage premium data. This is a relatively conservative value based on willingness-to-pay studies. Using the expected discounted life years remaining from age 40, and a discount value of 5 percent, a value of $89,074 per life year saved was derived. Combining this figure with the discounted number of life years saved produces a benefits estimate of $1.63 billion. As discussed earlier, there is reason to believe the fat contribution from USDA-regulated products is substantially higher than available estimates for fat from "meat and poultry." Under an assumption that USDA-regulated products account for half of dieting fat and cholesterol, the projected benefits based on the SDA data would be $2.6 billion rather than $1.63 billion. The best estimate for USDA regulated products is probably somewhere in between. Based on the SDA data and the extent of USDA-regulated foods, FSIS will use $2.0 billion as the best available estimate of benefits. FDA presented other methods of valuing benefits that would increase the estimated benefits by a factor of more than five. For example, an alternative approach is to apply a mean value to all early deaths, regardless of age. A value of $30 million per early death would result in a benefit estimate of $9.57 billion ($3.0 million × 5,818 deaths avoided discounted to 3,189).

In its regulatory analysis for nutrition labeling, FDA took the position that they believe that the estimate of the health gains derived from the SDA study is probably an underestimate. The two primary reasons for this belief identified by FDA are the fact that no reformulation took place during the SDA study and the quantification of early death benefits left out quality of life gains from fewer cases of CHD and cancer. Each case of cancer and CHD that does not result in early death still tremendously reduces the quality of life for both the afflicted and those around them.

There are also reasons to discount estimates of major changes in consumer purchasing patterns. A recent report [15] published by the National Livestock and Meat Board noted that the absence of additional change in the second 2-year period for SDA supports the idea that there is a limited pool of nutrition-concerned shoppers, and sales of items with positive nutritional attributes could be expected to level off after a certain time period. The paper also noted that sales of the SDA nutrition booklet were relatively low when priced at $.50.

[13] Draft Regulatory Impact Analysis of the Proposed Rules to Amend the Food Labeling Regulations, Economics Section, Center for Food Safety and Applied Nutrition, FDA, June 13, 1991.

[14] Discounting is used to put all costs and benefits in present value so they are comparable. Discounting takes account of the fact that resources in a given year are worth more than identical resources in a later year because of return on investment.

[15] In-Store Nutrition Information on Fresh Meat: Issues and Insights, Research Report No. 100-1, National Livestock and Meat Board, 1990.

FSIS views the SDA-based estimate of $2.0 billion as the best available estimate at the current time. The Agency is concerned that an important point can easily get lost in debating the methodology and that is the RTI finding that relatively small changes in nutrient intakes can generate large potential health benefits. While consumer awareness has increased since the SDA project, FSIS sees the potential for substantially higher benefits tied to the effectiveness of ongoing nutrition education programs. Nutrition labeling provides the information needed for the market to respond to changing demands generated by educational programs.

IV. Preliminary Compliance Cost Analysis

A. Scope, Purpose, and Overview of Methodology

1. Scope and Purpose of the Preliminary Compliance Cost Analysis

FSIS estimates that approximately 8,933 U.S. companies owning 9,503 meat and poultry manufacturing facilities would be affected by the proposed nutrition labeling rule. The number of facilities is based on actual counts as of September 30, 1990.[16] These companies and facilities would have to engage in activities to bring their current product labels into compliance, and subsequently incur costs.

The purpose of this chapter is to present preliminary estimates of the compliance costs that would be borne by affected U.S. companies to bring their current product labels into compliance. The preliminary estimates are primarily based on information collected by Research Triangle Institute (RTI) during personal interviews conducted in August and September, 1991, with nine processed meat and poultry companies, but also rely on information from selected analytical testing laboratories, the Bureau of the Census, FSIS, and miscellaneous other sources. The preliminary analysis also estimates annual recurring analytical costs to now-operating processed meat and poultry companies for current products, but does not address future costs as companies bring new products on-line under the proposed rule.

The preliminary cost estimates presented herein serve several purposes. The estimates can be compared to preliminary estimates of the benefits of the proposed rule, and they can be used to help determine industry impacts.

2. Overview of Methodology

Labeling decisions are normally made—and costs incurred—at the company-level rather than the facility-level. As most meat and poultry companies are single-plant companies, the "company" and "facility" are effectively synonymous in most instances. A significant number of companies own multiple establishments, however, and these companies tend to make labeling decisions for all of their affected facilities in a centralized manner. Indeed, some multi-plant companies manufacture identical products in more than one plant, and/or use identical labels in more than one plant.

[16] Meat and Poultry Inspection, Report of the Secretary of Agriculture to the U.S. Congress, USDA, FSIS, March 1, 1991.

Decisionmaking at the company level allows companies with multiple-facilities to take advantage of certain economies of scale.

In its study for the Food and Drug Administration (FDA) in January 1991,[17] RTI found that labeling costs vary by company. This appears to be true partly because larger companies tend to manufacture more products under more labels, and partly because companies of different sizes tend to incur different costs per label and per product.

Consistent with the methodology employed in that study, the processed meat and poultry industry has been segmented into three sizes of companies. Simply stated, the average cost of the proposed rule to each of three sizes of companies is estimated based on information collected during personal interviews with decisionmakers at nine meat and poultry companies and from several other sources. The average of the company cost estimates are then multiplied by the number of companies of each size in the population to derive total industry costs.

The methodology employed in this analysis consists of four fundamental steps. First is the collection of nutrition labeling cost information from nine companies and from several independent analytical laboratories. Second is the estimation of the average cost of the labeling rule for each of three sizes of companies using that information. Third is the estimation of the population of affected processed meat and poultry products companies in the U.S. in each of the three size ranges. Fourth is the extrapolation to the population of the compliance cost of the proposed rule.

RTI arranged and conducted nine personal interviews with owners, executives, and managers of nine potentially-affected companies. The companies were selected on the basis of type, size, location, and cooperation. Three small, three medium, and three large companies were interviewed. These companies are neither the largest nor the smallest in the industry, but rather were selected for their representativeness of large, medium, and small companies. Companies that produce a variety of processed meat and poultry products (beef, poultry, and pork; frozen, refrigerated, preserved and canned) were interviewed. Companies that sell only institutional products were excluded, because the objective of the analysis was to estimate the cost of providing nutrition labeling on processed retail products. Many of the companies interviewed do, however, produce both retail and institutional products. For the same reasons, companies that produce only fresh products were excluded, though again many of the companies interviewed produce both fresh and processed products. To make maximum use of project resources, three companies of each size were interviewed in each of three locations: North Carolina, Cincinnati, Ohio, and the vicinity of Dallas-Fort Worth, Texas. Lastly, since interviews lasted from 2 to 4 hours each, companies that were cooperative enough to dedicate that time were sought.

Interviews were conducted between August 13 and September 4, 1991. Without exception, the participating decisionmakers were prepared and generous with their time and information. Their identities are confidential as the information they provided was sometimes proprietary. Owners, executives, and managers were engaged in a series of inquiries related to the costs they would incur under the proposed mandatory nutrition labeling rule for processed meat and poultry products. Care was taken to limit the discussions to those products and labels that would actually be affected by the proposed FSIS rule.

Nutrition labeling cost extrapolation to the population using this methodology requires an estimate of the number of affected small, medium, and large meat and poultry companies. The estimate derived for and employed in this study is based on information provided by FSIS, information published in several trade journals, data from the 1987 Census of Manufactures, the 1987 Census of Wholesale Trade, and several simplifying assumptions. In brief, FSIS provided an estimate of the total number of affected meat and poultry facilities. An article in the June 1991 issue of *Meat Processing* [18] characterizing the sales and employment of the largest 200 companies in the meat and poultry industry helped with the estimate of the number of large companies. Estimates of the number of medium and small companies were then based on Census estimates of the size distribution of facilities.

The cost of the proposed rule to industry has been estimated by first multiplying the estimated average cost to each of three company sizes by the estimates of the number of small, medium, and large companies in the population, and then by summing across company sizes. Since it is very difficult to confidently estimate the compliance cost of such a rule with the available data, several estimates under varying assumptions are presented in a scenario framework.

The activities undertaken by companies to comply with a mandatory nutrition labeling requirement can be broken down into six categories: Administrative, analytical testing, marketing, printing transition, inventory transition, and equipment transition. Not all types of costs are necessarily incurred by all companies. The nine interviews suggest that while the majority of companies would incur administrative, analytical, printing transition, and label inventory transition costs, a significant number of companies might incur little if any costs for marketing and equipment transition.

Administrative Activities

The administrative activities potentially associated with the proposed nutrition labeling rule encompass a broad range of tasks. Administrative activities are usually the first reaction to a labeling rule and the

[17] Compliance Costs of Food Labeling Regulations, prepared for the Food and Drug Administration, Michael French et al., Center for Economics Research, Research Triangle Institute, January 1991.

[18] Meat Processing (1991). Top 200 Meatpackers, Processors, and Poultry Companies, June 1991. pp. 35–56.

last activities to complete the compliance process. After FSIS promulgates a labeling rule, companies will generally perform the following sequence of administrative events:

- Interpret the policy,
- Determine the applicability to their product labels,
- Establish a corporate position,
- Formulate a method for compliance, and
- Manage the compliance method.

It appears that, in general, administrative effort is related to

- The scope of the rule,
- The severity of the rule,
- The length of the compliance period, and
- The company size.

The 1991 study for FDA found that once a particular labeling rule is identified, personnel from up to eight different departments in large companies may become involved with interpreting the rule, determining its scope, and establishing a corporate position. They may continue the administrative process by forming a committee to develop a compliance method. Nutrition information for affected products must be determined by analytical methods or published data. If the committee agrees on a label change, signatures are required from representatives in each of the eight departments to authorize the change. Management then distributes a label change order to the appropriate departments, which begin the physical conversion to a new label.

The nine interviews with meat and poultry companies confirm that administrative activities may be as complex as those described in the FDA study for large companies It is also clear though that decisionmaking may involve one or only several individuals in medium and small firms.

Analytical Testing Activities

Analytical testing activities are conducted to determine the nutrition profiles of affected products. Analytical testing may be conducted in-house by some of the larger companies in the industry, but the majority of companies will rely on contract laboratories. Even the largest companies interviewed reported that they would contract-out nutrition analyses for certain nutrients and food components for lack of in-house capability.

Information was collected on the number of products each company has, the number of samples of each product they anticipate testing in response to the proposed rule, and their estimate of the cost per test. Companies were also asked whether they have analytical information in their files for certain formulations, and whether they would use this information or conduct repeat and supplemental analyses. Because only a subset of the interviewed companies had confidence in their estimates of analytical costs per product, price information was collected from several additional contract laboratories.

Market Testing Activities

FSIS acknowledges the possibility that some companies may reformulate some products in response to the rule. Rather than analytically test a particular product and redesign its label(s) with nutrition information, a company may, for example, reformulate it in an effort to reduce calories, fat, sodium, or other nutrients that it feels consumers may perceive as "too high" in the current formulation. Companies that do this might subject the new products to internal and/or external market tests.

It is also possible that some companies will conduct market tests of newly-designed labels. Subject to regulatory requirements, companies may market test various nutrition panels to see which one most appeals to consumers.

Label Conversion Activities

Label conversion is the most obvious activity performed during a mandated label change. When quantifying printing effort, it is important to differentiate between the normal activities of printing labels and the incremental activities attributable to rule-induced label changes.

Though none were identified in the nine interviews, some companies' labels for some products may already comply with the proposed rule, so there are no incremental printing costs for such labels. Other labels would be redesigned during the proposed rule's compliance period anyway, and so incremental printing costs would not be present. Depending on the frequency with which companies redesign labels at baseline and the allotted time for compliance, incremental printing activities may be nonexistent.

Consider the following scenario. A company redesigns labels every 12 months on average and is six months away from their next planned redesign when FSIS promulgates a nutrition labeling rule that allows one year for compliance. This company will likely combine mandated label changes with planned label changes for most of its products.

The 1991 study for FDA found that incremental printing effort is primarily conditional on the complexity of the label change, the printing process(es), and the length of the compliance period. The complexity of the label change determines the level of effort for artwork, stripping, and engraving. It also determines the number of plates or cylinders to modify or replace. The printing process also dictates what type of plate or cylinder to modify or replace. Finally, the length of the compliance period determines the opportunities available to coordinate planned film and printer plate or cylinder replacements with rule-induced replacements. For this reason, as the compliance period increases, incremental printing effort may decline. Because printing activities are specific to individual labels, computing incremental printing effort on a per-label basis is necessary.

Despite the similarity and relative simplicity of line copy changes, companies differ in incremental printing effort. If flexography or lithography printing is used, many companies engrave new lettering onto an existing printing plate to save time and resources. Other companies order new printing plates regardless of how minor the line copy change may be, for gravure printing, every label change will result in a new cylinder since modifying gravure cylinders is not possible.

Label Inventory Transition

The fifth activity category is label inventory transition from old to new labels. The probability of label inventory loss is positively related to the average label inventory and inversely related to the compliance period.

Equipment Transition

Equipment transition activities may involve costs for companies that have to scrap, sell, or modify equipment that they now own, and/or purchase new equipment. Two types of equipment are potentially involved, based on the nine interviews. One is labeling equipment that applies pre-printed labels to food packages. Some companies may own machines, for example, that can handle labels up to some maximum size, a size which may be inadequate for a nutrition panel. Other companies may have machines that can apply larger labels with nutrition panels to their packages, but only after some modification.

Another type of equipment that may be germane in the cost analysis is analytical equipment. This includes equipment that might be purchased to allow companies to do analytical testing in house, or at least to allow them to maintain better quality assurance on fat, moisture, and protein content so they can reduce the risk of having their products out of compliance in a less expensive manner than contracting out repeat analytical tests. Since companies might purchase analytical equipment in order to reduce costs, and since the cost estimates derived in this study are based on full, commercial analytical testing prices, equipment purchases may represent cost savings rather than incremental costs.

B. Compliance Cost Data From Company Interviews and other Sources

Most of the nine companies provided information that they consider proprietary. Examples include sales, employment, numbers of product formulations, numbers of labels, in-house analytical capabilities, estimates of compliance costs, etc. Partly to ensure confidentiality, and partly to ensure that the cost estimates of this preliminary analysis do not rely too heavily on the responses of any one company, the interview data have been averaged to compute compliance costs for representative small, medium, and large companies.

Based on the desire to extrapolate the interview cost results to the population of approximately 8,933 companies, and given the sales data for the companies interviewed, small companies have been defined as those with annual sales below $5 million, medium companies as those with annual sales between $5 million and $50 million, and large companies as those with annual sales above $50 million.

The average annual sales of processed meat and poultry products, average company employment, the average number of active labels for processed meat and poultry products, and the average number of processed meat and poultry products of the

small, medium-, and large companies interviewed by RTI for this project are presented in Table 9.

TABLE 9.—SALES, EMPLOYMENT, ACTIVE LABELS, AND PRODUCTS OF INTERVIEWED COMPANIES

	Small (<$5M)	Company size medium ($5M–$50M)	Large (>$50M)
Sales	$2.0M	$10.4M	$401.7M
Employment	23	73	3,133
Active Labels	43	56	772
Products	39	22	335

Note: Company sales, employment, active labels, and products are means of data reported by three small companies, three medium companies, and three large companies during interviews with RTI.

Note that the average sales of the small and medium companies are within the ranges established for these sizes. The average annual sales of the large companies, $402 million, can be placed in some context by noting that the mean and median sales of the 134 companies reported in *Meat Processing* (June 1991) with annual sales in excess of $50 million are $607 million and $160 million, respectively. Thus, the average interviewed large company's annual sales are below the mean and above the median.

The actual processed meat and poultry sales of the nine companies interviewed vary significantly around the mean. For example, one of the small companies has sales under $1 million per year, and another has sales approaching $5 million. Interviewed medium company sales vary from just over $5 million to just under $50 million. Interviewed large company sales vary from just over $50 million to nearly $1 billion. Also note that sales of several of the companies interviewed are somewhat higher when fresh products are included.

It is worth noting that the average number of active labels (for processed meat and poultry products) of medium companies is only somewhat higher than that for small companies, and that the average number of product formulations is actually higher for small companies than for medium companies. This is potentially significant, as it means that sales per product and sales per label are substantially lower for small companies than for medium, as they are lower for medium companies than for large. This in turn implies that compliance costs per dollar of firm sales may vary substantially by firm size.

Table 10 presents more information on these relationships. Note that the average annual sales per product for medium companies are nearly 10 times those of small companies, and that average annual sales per product for large companies are about 2.5 times those of medium companies. Though less pronounced, a similar relationship holds for sales per label.

TABLE 10.—ANNUAL SALES PER PRODUCT AND PER LABEL OF INTERVIEWED COMPANIES, BY COMPANY SIZE ($)

Size of company	Annual sales per product	Annual sales per label
Small Companies:		
Minimum	$17,333	$16,667
Means	50,128	45,308
Maximum	90,000	90,000
Medium Companies:		
Minimum	444,444	121,951
Mean	471,212	184,024
Maximum	500,000	244,595
Large Companies:		
Minimum	310,174	166,667
Mean	1,199,005	520,294
Maximum	5,000,000	2,391,304

The balance of this section presents estimated average costs of the proposed nutrition labeling rule to small, medium, and large companies interviewed. The cost estimates are primarily based on results from the nine company interviews, though price quotes obtained from several independent analytical laboratories are also employed. The average per-company costs of administrative activities, nutrition analysis activities, label printing transition activities, and inventory management activities are treated separately and then totaled.

In this analysis, product and label market testing activities are only discussed qualitatively. With data from a total of only nine companies, it is extremely speculative to quantify these two cost categories. Not a single medium-sized company indicated that it would do any market testing of new formulations or labels. Of the three small companies interviewed, two said they would not do any market testing, and one indicated they might, but probably wouldn't. Similarly, only one of the three large companies indicated they might market test reformulated products, and that company would test only a share of its formulations and then only if they reformulated. Since the data received suggest that market testing would be unusual, estimates of the costs are not presented here.

Analogously, it is extremely speculative to quantify costs of equipment transition. While one medium company and one large company indicated they would have to scrap or modify labeling machines, most companies indicated that they would neither scrap old equipment nor purchase new equipment. Several companies indicated that they might purchase analytical equipment, but it is not clear that these purchases would impose incremental costs over and above those estimated in this analysis. Consequently, equipment transition costs are not quantified in this analysis.

1. Administrative Costs of Nutrition Labeling

Preliminary estimates of the administrative costs that would be incurred by companies bringing current products and labels into compliance with the proposed rule are presented in Table 11. Whether and how administrative costs are related to company size in unclear. All companies except one reported administrative costs of between $2,000 and $20,000. A much higher estimate was reported by the largest company interviewed (sales approaching $1 billion). On a per-label basis, administrative costs average $214 for small companies, $81 for medium companies, and $112 for large companies.

TABLE 11.—ADMINISTRATIVE COSTS OF NUTRITION LABELING TO INTERVIEWED COMPANIES ($/COMPANY)

Size of company	Administrative cost
Small Companies:	
Minimum	$2,000
Mean	9,293
Maximum	19,200
Medium Companies:	
Minimum	2,000
Mean	4,554
Maximum	7,500
Large Companies:	
Minimum	9,600
Mean	86,333
Maximum	237,900

All of the estimates in Table 11 are based on responses by the interviewed companies under instructions to assume that they would have a one-year (12 month) period between promulgation of the nutrition labeling rule and enforcement. Essentially all companies maintained (acknowledged) that the administrative cost of bringing current labels into compliance would be higher (lower) if they had fewer (more) than twelve months to comply. One large company estimates that their administrative cost would be 50 percent higher under a 6-month compliance period and ⅓ lower under a 24-month compliance period, since there would be differences in overtime costs, opportunities for decisionmakers to discuss labeling issues during regularly-scheduled meetings, etc. However, since none of the other eight companies were able to quantify these same differences, we will not speculate on additional costs or savings to a representative company or industry of a shorter or longer compliance period.

2. Analytical Testing Costs of Nutrition Labeling

Analytical testing costs incurred by a given company depend on the number of products the company produces, the types of products the company produces, whether the decisionmakers elect to test for all components or only those components not already on file (incremental testing), and the number of tests per product the decisionmakers elect to conduct.

The range and means of numbers of products that would have to be analytically tested by the nine companies interviewed are reported in Table 12.

TABLE 12.—NUMBER OF PRODUCTS FORMULATIONS TO BE TESTED AT INTERVIEWED COMPANIES

Size of company	Number of products to be analytically tested
Small Companies:	
Minimum	22
Mean	39
Maximum	50
Medium Companies:	
Minimum	10
Mean	22
Maximum	38
Large Companies:	
Minimum	19
Mean	335
Maximum	806

Since the average number of products of small firms is greater than that of medium firms, analytical testing costs are higher for small firms than for medium firms. Testing costs are considerably higher though on average for large firms than for small or medium firms. Product types also influence analytical testing costs. Analytical profile costs essentially depend on the number of nutrients/components tested in a sample. The more components tested, the higher the cost of testing. Under the proposed rule, essentially all processed meat and poultry products would have to be tested for at least the following ten nutrients/components: Total calories, Total fat, Total carbohydrates, Protein, Sodium, Saturated fat, Cholesterol, Iron, Calcium, and Total calories from fat.

Some processed meat and poultry products (e.g. complete meals containing meat and poultry) would also have to be tested for one or more of the following: vitamin A, vitamin C, and dietary fiber. Since dietary fiber will be present in significant amounts less often than the other components, the costs of two additional analytical profiles have been estimated. One is the list of ten components plus vitamin A and vitamin C (the "expanded test"), and the other is the list of these twelve components plus dietary fiber (the "complete test").

For this preliminary analysis, a weighted-average analytical testing cost is computed and applied to all meat and poultry products. It is assumed that 50 percent of all products will be tested at the basic 10-component analytical testing cost, that 40 percent of products will be tested at the expanded twelve-component analytical testing cost, and that 10 percent of products will be tested at the complete thirteen-component analytical testing cost. Using the price estimates of seven analytical testing companies, the weighted-average estimate is $368, as presented in Table 13.

TABLE 13.—ANALYTICAL TESTING COSTS ($/SAMPLE)

	Range	Mean
Total calories		
Total fat		
Saturated fat		
Cholesterol		
Protein		
Carbohydrates		
Sodium		
Iron		
Calcium		
Calories from fat		
Subtotal	$206–378	$304
Vitamin A		
Vitamin C		
Subtotal	288–503	414
Dietary fiber		
Subtotal	350–610	506
Weighted-Average Cost [1]		368

[1] [$368=(0.5×$304)+(0.4×$414)+(0.1×$506)]
Note: Estimates based on informal price-quotes from seven companies.

Of the nine meat and poultry companies interviewed, five have essentially no analytical data on file for their formulations, while the other four have at least some nutrition information on file for at least some of their products. Of the four companies interviewed that have some nutrition information on file, three are large and one is medium. By definition, incremental nutrition testing—the testing of product samples only for nutrients/components not already known—is not an option for the five companies with no data on file. Of the four companies interviewed with some nutrition data on file for their products, two indicated that they would incrementally test if allowed to do so under the rule. The other two companies reported that as a matter of company policy, they would test new samples for all components rather than rely on incremental testing. For purposes of this preliminary analysis, the assumption is that no companies will conduct incremental testing of products. This assumption may tend to overestimate analytical testing costs.

A fourth and very influential analytical cost determinant is the number of samples of each product that would be tested by the company. The proposed rule does not specify the number of analytical tests that would be required for each product. Three of the companies interviewed (one large, one medium, and one small) indicated they planned to test one sample, or as few samples as allowed under the rule. One (small) company indicated they would test more than four samples of each product before nutrition labeling under the rule. The other five companies (two large, two medium, and one small) indicated they would test three or four samples (e.g. quarterly testing) of each product.

Because the number of tests performed per product is a very influential cost determinant, two scenarios are considered. One scenario assumes that all companies in the industry will test all of their products only once prior to label submittal. The single-test assumption may tend to underestimate analytical testing costs, somewhat balancing the earlier assumption of no incremental testing.

The other scenario assumes that companies will perform as many tests per product as they indicated during the interviews. This scenario is implemented by computing a product-weighted average number of tests per product for small, medium, and large companies. Based on the information provided, small companies would conduct an average of 4.3 tests per product, medium companies 3.4 tests per product, and large companies 2.7 tests per product.

Based on the company interviews, the number of tests that companies would conduct per product declines with increasing company size because smaller companies produce batches on a less continuous, more periodic basis and are more concerned about batch-to-batch consistency. All three of the small companies interviewed indicated that they produce many of their products on a weekly basis—or even a monthly basis—rather than on a continuous or daily basis. These same companies expressed concern about the consistency of the nutrition content of their products from batch-to-batch—especially those that are produced only weekly or less frequently. These concerns prompted the smaller companies to indicate that they would have to test products frequently.

Preliminary estimates of per-company analytical testing costs under both scenarios are presented in Table 14.

TABLE 14.—ANALYTICAL TESTING COSTS OF NUTRITION LABELING ($/COMPANY)

Size of company	Single-test scenario	Multi-test scenario
Small Companies:		
Minimum	$8,280	$35,604
Mean	14,413	61,977
Maximum	18,400	79,120
Medium Companies:		
Minimum	3,680	12,512
Mean	8,096	27,526
Maximum	13,984	47,546
Large Companies:		
Minimum	6,992	18,878
Mean	123,280	332,856
Maximum	296,608	800,842

*Assumes 4.3, 3.4, and 2.7 tests per product for small companies, medium companies, and large companies, respectively.

3. Printing Transition Costs

Printing costs incurred by any given company depend on the number of labels the company has to change, the types of labels the company has, and the period of compliance.

Label redesign (artwork) and printing plate modification or replacement is fairly label specific, though one company did indicate that there are some economies of scale in artwork—the more similar labels the company has to redesign, the lower the artwork cost per label other things being equal. Given any mix of label types and compliance period, the more labels a company has to bring into compliance with the rule, the greater the cost the company will incur. None of the approximately 2,600 labels for processed meat and poultry products manufactured by the nine companies interviewed during this study currently have nutrition panels that comply with the

proposed rule. While some of the larger companies have several labels with some nutrition information, none have information even on the basic-ten nutrients/food components. Generally, the more complex the label design and the greater the use of colors, the more expensive the artwork and plate change costs. Average costs per label increase with company size, apparently because larger companies use more complex and colorful labels on their products.

Average label redesign and plate changeover costs on a per-label basis are reported in Table 15.

TABLE 15.—LABEL REDESIGN AND PLATE CHANGE-OVER COSTS OF INTERVIEWED COMPANIES ($/LABEL)

Size of company	Average cost per label ($)
Small Companies:	
Minimum	$168
Mean	234
Maximum	275
Medium Companies:	
Minimum	200
Mean	1,457
Maximum	2,972
Large Companies:	
Minimum	1,053
Mean	2,251
Maximum	4,000

The period of compliance between promulgation of the nutrition labeling rule and enforcement will also influence printing costs. All companies change labels occasionally at baseline. Some companies change some labels every few months, while other companies have labels that have not been changed for several years. The greater the period of compliance, the better the opportunity for a company to coordinate a mandated nutrition label change with a change already planned at baseline.

Ranges and model company estimates of printing transition costs on a per-company basis under two compliance period scenarios are reported in Table 16.

TABLE 16.—NEW LABEL PRINTING COSTS OF NUTRITION LABELING ($/COMPANY)

Size of company	12-month period	24-month period
Small Companies:		
Minimum	$5,160	$0
Mean	7,148	4,632
Maximum	9,408	8,736
Medium Companies:		
Minimum	4,920	1,640
Mean	74,869	63,909
Maximum	160,488	160,488
Large Companies:		
Minimum	26,082	0
Mean	1,175,700	60,016
Maximum	3,000,000	167,006

Note: Estimates reflect the number of active labels per company, baseline label modification frequencies reported by companies, and average costs per label.

Each average (mean) estimate is based on the average number of label per model company, the average cost per label change, and the compliance period in relation to the baseline average label redesign period. Twelve-month per-company costs are approximately 10.5 times higher for medium companies than for small companies, and about 15.7 times higher for large companies than for medium companies. Remember that while larger companies may tend to change labels more frequently at baseline than smaller companies, larger companies have more labels to change and the per-label transition cost is higher.

4. Label Inventory Transition Costs

Label inventory transition costs will be incurred by companies that have to discard non-compliant labels at change-over and/or pay higher prices per label for smaller label orders during the transition period. Label inventory transition costs incurred by any given company will depend on the number of different labels the company has in inventory, their normal label inventory management practices, their label types (because more complex labels are more expensive), and the period of compliance. The average number of processed meat and poultry labels used by small, medium, and large companies interviewed by RTI are 43, 56, and 772, respectively. All nine companies indicated that they normally carry months—not years—of most of their labels in inventory. The simple mean label inventory time across all companies is 5.8 months. This perhaps explains why most of the nine companies interviewed indicated that the cost of inventory transition is not of major concern for them.

Most of the companies interviewed indicated that inventory losses would be minor or even nonexistent under either a 12-month or 24-month compliance period. In fact, the data they provided indicate that inventory costs are the smallest component of the cost of the nutrition labeling rule for eight of the nine companies, even assuming a 12-month compliance period. Estimated per-company label inventory transition costs under 6-month, 12-month and 24-month compliance period scenarios are reported in Table 17. Estimates for a 12-month compliance period range from $0 to $60,000 per-company, though averages are under $1,000 for small and medium companies. The 12-month cost estimates reported in Table 17 are those reported by companies during the RTI interviews.

TABLE 17.—LABEL INVENTORY TRANSITION COSTS OF NUTRITION LABELING ($/COMPANY)

Size of company	6-month	12-month	24-month
Small Companies:			
Minimum	$0	$0	$0
Mean	1,667	833	417
Maximum	4000	2,000	1,000
Medium Companies:			
Minimum	0	0	0
Mean	1,333	667	333
Maximum	4,000	2,000	1,000
Large Companies:			
Minimum	0	0	0
Mean	66,667	33,333	16,667
Maximum	120,000	60,000	30,000

All companies reported that inventory transition costs would be substantially lower under a 24-month compliance period. The large company that estimated it would incur a $60,000 inventory transition cost under a 12-month compliance period also indicated that its cost would be "negligible" under a 24-month compliance period. Most companies found the difference more difficult to quantify. In this analysis it is assumed that inventory transition costs would be 50 percent lower under a 24-month compliance period than under a 12-month compliance period and 50 percent higher under a 6-month compliance period.

5. Total Compliance Costs

The total per-company compliance cost preliminary estimates are summarized in Table 18. The total cost is presented under six alternative scenarios: Combinations of three compliance periods (6-, 12-, and 24-month) and two analytical testing assumptions (single- and multi-test per product).

TABLE 18.—PRELIMINARY ESTIMATES OF COMPANY COMPLIANCE COSTS OF THE PROPOSED NUTRITION LABELING REGULATION ($/COMPANY)

Cost category	Small	Medium	Large
Administrative	$9,293	$4,554	$86,333
Analytical:			
Single-test	14,413	8,096	123,280
Multi-test	61,977	27,526	332,856
Printing:			
6-month	8,406	80,349	1,733,542
12-month	7,148	74,869	1,175,700
24-month	4,632	63,909	60,016
Inventory:			
6-month	1,667	1,333	66,667
12-month	833	667	33,333
24-month	417	333	16,667
Total:			
24-month/single	28,755	76,893	286,296
12-month/single	31,687	88,186	1,418,646
6-month/single	33,779	94,333	2,009,822
24-month/multi	76,319	96,322	495,872
12-month/multi	79,251	107,617	1,628,222
6-month/multi	81,343	113,763	2,219,398

C. Estimate of Population of Affected Companies

Preliminary estimates of the cost of the proposed nutrition labeling rule on a per-company basis have been presented, discussed, and qualified above. As explained in Section A.2, Overview of Methodology, an

estimate of the number of affected small, medium, and large processed meat and poultry companies is also required to estimate the industry cost. The methodology and results of a preliminary estimation of company counts is the topic of this section.

Based on the results of the nine company interviews, large companies are defined to be those with $50 million or more in annual sales; medium companies are those with annual sales between $5 million and $50 million; and small companies are those with annual sales under $5 million.

Using several data sources—FSIS's estimate of 9,503 meat and poultry establishments, Census data cross-tabulating sales and establishments with employment, and Meat Processing's list of the top 200 Meatpackers, Processors, and Poultry Companies—the number of small, medium, and large companies in the industry have been estimated.

Estimating the number of large companies is relatively straightforward. Meat Processing magazine publishes a list of the top 200 meat and poultry companies ranked by sales. According to this list there are 134 large companies—companies with $50 million or more in sales. The number of medium and small companies cannot be estimated from this list alone. FSIS data facilitates the calculation of the number of small and medium companies.

FSIS data shows there are approximately 9,503 federally- and state-regulated establishments. The top 200 list states that the 134 large companies (with annual sales in excess of $50 million) own 690 establishments. Subtracting these 690 establishments from the total of 9,503 leaves 8,813 as the total number of establishments owned by small and medium companies. The top 200 list also states that the 66 largest medium companies (the bottom 66 companies on the top 200 list) have a total of 80 establishments, or approximately 1.2 establishments per company. Assuming that the ratio of all other companies to establishments is 1 to 1, there are 8,733 (8,813−80) more medium and small companies besides the 66 previously mentioned medium companies. Thus, there are 134 large companies and 8,799 (66+8,733) medium and small companies.

It is now necessary to rely on another data source to estimate how many of these 8,799 companies are small and how many are medium. The 1987 Census of Manufacturers and Census of Wholesale Trade Industry Series provides data on the size distribution of facilities in the most important industries that produce processed meat and poultry products. By assuming that small facilities (those with under $5 million in annual sales) are owned by single-facility companies, the size distribution of small and medium facilities indicates the size distribution of small and medium companies.

Using the 1987 Census data for eight four-digit Standard Industrial Classification industries (Meat Packing, Sausages and Other Prepared Meats, Poultry Slaughtering and Processing, Canned Specialties, Frozen Specialties, Food Preparations not elsewhere classified, Poultry and Poultry Products Wholesale Trade and Meat and Meat Products Wholesale Trade), there are approximately 2.2 small facilities per medium facility.

Applying this ratio and combining the results with the previous estimates that there are 134 large and 66 medium companies with multiple establishments, there are an estimated 134 large companies, 2,933 medium companies, and 5,866 small companies that collectively own the estimated total of 9,503 meat and poultry establishments.

D. Preliminary Estimates of Compliance Costs

Preliminary estimates of the one-time compliance costs of the proposed nutrition labeling rule are derived by multiplying average small, medium and large company preliminary cost estimates (from Section B) by preliminary estimates of the total number of processed meat and poultry products companies of each size (from Section C).

The dependence of these estimates on the data collected from a small, non-random sample of meat and poultry products companies can not be overemphasized. Administrative, analytical, printing transition, and inventory transition costs of the rule are apparently highly dependent on the number of products and labels affected by the proposed rule. If the estimated numbers of affected products and labels for small, medium, and large companies are significantly greater or lesser than the actual numbers of products and labels at small, medium, and large companies in the industry, the preliminary cost estimates presented in this Chapter are biased accordingly.

Using the estimates of average numbers of labels per company given in Table 9, and the estimates given in Section C of the numbers of small, medium, and large companies in the industry, there are an estimated 519,934 affected labels. FSIS believes that this estimate is more likely to be high than low, primarily because the estimate is based on the assumption that all State plants have the same number of labels as the average of the three small firms that were interviewed. In the analysis, the 3,376 State plants account for 145,168 labels, an average of 43 per plant. The federally-inspected plants account for 374,766 labels.

Computing industry sales and products in an analogous manner, there are about 338,190 affected products. Assuming a total of 8,933 meat and poultry products companies, there is an average of 38 products per company. It is difficult to know whether this estimate is high or low based on the available data.

Preliminary estimates of the one-time industry cost of the proposed rule are presented in Table 19. Estimates range from $433 million (under the 24-month compliance period/single analytical test per product scenario) to $1,108 million (under the 6-month compliance period/multiple analytical test per product scenario).

TABLE 19.—PRELIMINARY ONE-TIME INDUSTRY COST ESTIMATES OF THE PROPOSED NUTRITION LABELING RULE ($ MILLION)

Cost scenario	
24-month, single test	$433M
12-month, single test	635M
6-month, single test	744M
24-month, multi-test	797M
12-month, multi-test	999M
6-month, multi-test	1,108M

Note: Cost estimates include administrative costs, analytical testing costs, label printing transition costs, and inventory transition costs. Cost estimates do not include costs of market testing reformulated products or re-designed labels, nor do they include costs of scrapping, modifying or purchasing equipment.

Printing and label inventory transition costs are assumed to be one-time expenses. While administrative costs of the rule may be incurred by affected companies into the future, analytical testing costs are assumed to be the major recurring expense.

Recurring analytical testing expenses that would be incurred by now-operating processed meat and poultry companies are estimated to be $535 million annually. This preliminary estimate assumes that 338,190 processed meat and poultry products will continue to be manufactured in the 20 years following enforcement of the proposed rule. FSIS anticipates that as time passes and companies gain confidence that their labels are within compliance tolerances, producers will test products, on average, once every two years. FSIS also estimates that approximately 40 percent of processed meat and poultry labels contain substantive nutrition information on their labels. The agency thus believes that while it is appropriate to assume that all products are subject to full tests during the compliance period, it is also reasonable to assume that the recurring 20-year analytical testing costs attributable to the proposed rule are only the incremental testing costs for those nutrients and food components that would not be analyzed at baseline.

Assuming that 50 percent of all products are un-tested each year, that 30 percent of all products are tested for all nutrients each year, and that 20 percent are incrementally tested each year for cholesterol, saturated fat, and calories from fat, the weighted-average analytical cost per product is $127.

The recurring analytical testing cost of the proposed rule is $43 million per year. The present value of 20 years of recurring analytical costs assuming a 5-percent discount rate is $535 million.

Preliminary estimates of the total present-value cost of the proposed rule are presented in Table 20.

TABLE 20.—PRELIMINARY PRESENT-VALUE INDUSTRY COST ESTIMATES OF THE PROPOSED NUTRITION LABELING RULE ($MILLION)

Cost scenario	
24-month, single test	$968M
12-month, single test	1,170M
6-month, single test	1,279M
24-month, multi-test	1,332M
12-month, multi-test	1,534M
6-month, multi-test	1,643M

Note: Includes both one-time compliance cost and five-percent discounted present-value of 20 years of recurring analytical testing costs.

Estimates range from $968 million to $1,643 million, depending on the scenario. The simple levelized annual cost over a 22-year period (assuming a 24-month compliance period) is between $44 million (assuming the single-test scenario) and $60.5 million (assuming the multi-test scenario). The simple levelized annual cost over a 21-year period (assuming a 12-month compliance period) is between $55.7 million and $73 million.

V. Impact of Costs

A. Methodology

The previous chapter developed a preliminary estimate for the cost of compliance, i.e., the costs incurred by meat and poultry firms to comply with the proposed rule over a 20-year period. Economic impact differs from cost of compliance in that the economic impact analysis attempts to answer questions like:

- Will meat and poultry processors be able to pass costs onto consumers in terms of higher prices?
- Will processors have to absorb some or all of the costs out of existing profits?
- Will the costs cause some firms to go out of business?
- Will small businesses bear a disproportionate amount of the cost burden?
- How many jobs could be lost because of businesses forced to close?

The following economic analysis examines impacts under two scenarios. The first is that all costs are passed on to consumers and the second is that all of the costs must be absorbed. These assumptions cover both extremes recognizing that the actual impact would be somewhere in between. Economic impact could also include demand reduction or shifts in consumer preference among products if cost increases are sufficiently large. This type of analysis is beyond the scope of this preliminary impact analysis.

B. Costs Assumed To Raise Prices

The cost analysis in Chapter IV includes several scenarios with different estimates of up-front, one-time costs and different recurring costs. This analysis uses the one-time cost of $635 million for the scenario that provides a 12-month compliance period and assumes that on the average each product will undergo a complete nutrition analysis at a cost of $368 per product. The nondiscounted recurring costs would be $43 million per year for laboratory analysis.

Based on the 1990 population census of 252.6 million, the one-time, nonrecurring cost of $635 million equates to approximately $2.50 per person or $6.90 per household. Subtracting out infants under 5 years and vegetarians, the cost per meat and poultry consumer is approximately $2.80.

The most recent data[19] on food expenditures show that the average urban household spent $1,335 per person on food in 1988. The average rural household spent $1,178 on food per person in 1988. The average number of individuals per household is 2.75 based on the 1990 Census. The total number of households was 91,947,410.[20] The per household cost of $6.90 represents approximately 0.19 percent of an average urban household food bill of $3,671 [$1,335 × 2.75) and 0.21 percent of an average rural household food bill of $3,240 per year.

The annual recurring analytical costs of $43 represent approximately $.50 per household. This amount is negligible (.01 percent) of an annual household food bill. None of the above calculations assume a wholesale or retail market because additional profits due to fixed markups are not costs of the proposed regulations.

C. Costs Absorbed By Companies

This section assumes that a one-time, nonrecurring cost of $635 million and an annual recurring cost of $43 million would be absorbed by the companies that manufacture and distribute to retail stores consumer-sized packages of processed meat and poultry products. To help place these aggregate costs in perspective, this section develops an average annual cost per pound of production for different sizes of companies. To develop the average annual cost, the one-time, nonrecurring costs are annualized over a 20-year period.

The analysis assumes that a maximum of 9,503 domestic establishments will be affected by the proposed rule. This figure is the sum of federally-inspected processing plants and State-inspected plants. As of September 30, 1990, FSIS had 6,127 establishments processing under Federal inspection. At the same time, there were 3,376 State-inspected plants. Most, but not all, of the total 9,503 establishments produce consumer-sized processed products for sale in retail stores. Without an estimate of the number of establishments producing only fresh product, or only product for further processing, the analysis assumes all 9,503 establishments would be affected. As described previously, the 9,503 establishments were converted into 8,933 small, medium, and large companies. The average one-time and average recurring costs by company size are shown in Table 21.

TABLE 21.—AVERAGE COST BY COMPANY SIZE

Annual sales processed products	Number of companies	Average one-time nonrecurring cost	Average annual recurring cost
Less than $5 Million	5,866	$31,687	$4,953
$5 to $50 Million	2,933	88,186	2,794
More than $50 Million	134	1,418,646	42,545

FSIS collects data on the total number of pounds of finished meat and poultry products prepared at each official establishment. This data includes both fresh and processed products. Assuming that all the small companies are single establishment companies, it was possible to develop annual costs per pound for the small companies as shown in Table 22. The nonrecurring costs are annualized over 20 years to correspond to the timeframe for benefits.

TABLE 22.—AVERAGE ANNUAL COST PER POUMD OF PRODUCT

[Small companies]

	Average annual production of fresh and processed meat and poultry products	Average annual recurring cost per pound	Annualized average nonrecurring cost per pound [1]	Total annual average cost per pound
3,376 State Plants	24,000	$.21	$.16	$.37
Smallest 1,000 Federally-Inspected Plants	32,000	.16	.12	.28
Next 1,000 Larger Federally-Inspected Plants	174,000	.03	.02	.05

TABLE 22.—AVERAGE ANNUAL COST PER POUMD OF PRODUCT—Continued

[Small companies]

	Average annual production of fresh and processed meat and poultry products	Average annual recurring cost per pound	Annualized average nonrecurring cost per pound [1]	Total annual average cost per pound
Next 500 Larger Federally-Inspected Plants	400,000	.01	.01	.02

[1] A 10 percent cost of capital was used, rather than the 5 percent discount rate because financing the up-front costs is a cost of capital. The social discount rate used to convert both costs and benefits to present value for comparison purposes would underestimate the annual costs.

The average annual costs shown in Table 22 are for nutrition labeling on processed products while the production includes both fresh and processed products. In this analysis, companies have been categorized as small based on their sales or production of processed products. The totals could include some large firms where only a small portion af their business applies here.

The annual costs per pound in Table 22 would indicate that many small companies would not be able to recover all cost increases immediately. One does not need a sophisticated model to conclude that many small firms would not be able to add either $.28 or $.37 per pound to the wholesale prices they receive for their products. Thus, many small companies will have to absorb some costs out of existing profits.

Average production of processed products was also estimated for large and medium companies. Average annual production for large companies was estimated at 80 million pounds, a figure heavily influenced by packing firms that ship large volumes of boxed beef. The average annual production for medium companies was estimated at 4 million pounds. The annual cost per pound for these companies is minimal.

Estimates of the number of companies that could potentially go out of business would require an analysis of costs, profits, and business alternatives including changes in products produced. A detailed analysis of the impact on profitability and estimates of the number of firms that could go out of business is beyond the scope of this preliminary analysis. In general, the food processing industry is characterized as being very competitive with relatively low profit margins. This would support a conclusion that many companies would not be able to recover cost increases immediately.

While low profit margins may be characteristic of food processing in general, the USDA-regulated meat and poultry industry is actually a group of industries with varying profit structures. From 1980 to 1985, the sausage and prepared meat industry reported an annual return on sales of from 2.0 to 2.7 percent.[21] A 1981 study [22] of the frozen pizza industry estimated profit before taxes at 16 percent. These findings would indicate that the short-term economic impact will vary greatly depending on both the size of company and the products produced. The impact will also be highly dependent on alternative data sources for nutrition information that could substantially lower analytical costs for many firms. Some firms have also indicated that they would simply eliminate low volume, marginal products to lower their costs.

This discussion of impact also recognizes that meat and poultry processing is a rapidly changing industry where many firms enter and leave the industry each year. Because FSIS issues a grant of inspection before an official establishment can operate, the Agency has an accurate count on the number of new plants and withdrawals. Table 23 shows the changes from FY 1988 to FY 1990.

TABLE 23.—GRANTS AND WITHDRAWALS

FY	Number of grants issued	Number of withdrawals	Withdrawal rate per 10,000
1988	370	635	919
1989	420	582	866
1990	335	500	769

Note: The figures in Table 22 apply to the 6,127 Federally-inspected establishments, not the 3,376 State plants.

The Agency does not collect data on the reason for withdrawal. The rates of withdrawal are significantly higher than the business failure rates shown in Table 24.

TABLE 24.—BUSINESS FAILURES FOR MEAT AND POULTRY INDUSTRIES

[Rate Per 10,000]

Year	SIC code 2011	SIC code 2013	SIC code 2015
1985	116	174	337
1986	158	86	305
1987	82	104	160
1988	112	115	59
1989	103	67	120
1990	90	123	105

D. Differential Impact On Small Companies

The costs for the proposed rule are not necessarily proportional for large and small companies. For the companies interviewed, the cost analysis found that the average number of active labels of medium companies is only somewhat higher than that for small companies, and that the average number of product formulations is actually higher for small companies than for medium companies. Thus, the resulting cost estimates will not be proportional to size. An earlier study by FSIS on the frozen pizza industry referred to above had observed similar finding. This is, small companies have more varieties and sizes of frozen pizza, on average, than large companies distributing national brands.

In determining the impact of the proposed rule, the important variable is the sales volume per product or average sales volume for each formulation. Higher sales per formulation will provide a broader sales base over which to spread the initial company costs. Thus, a small firm with larger sales of a few products may be less affected than a larger company with many product formulations.

E. Impact on Trade

In 1990, processed meat and poultry products represented approximately 17 percent of the 2.6 billion pounds of meat and poultry imports. Out of a total of 1,370 authorized plants, 243 plants in 24 countries exported processed products into the United States. Canada accounted for the largest number with 96 plants. FSIS estimates that less than 5 percent of imported processed products are currently nutrition labeled.

There are approximately 12,000 labels approved for imported products. Chapter IV (Table 19) estimated the nonrecurring costs of modifying 520,000 labels within 12 months at $635 million, or approximately $1,220 per label. Applying the average domestic cost to 12,000 labels results in an estimated cost of $14.6 million, an average of $60,000 per plant ($14.6 million divided by 243).

The annual recurring cost of $43 million represents approximately $127 per product or $83 per label. Applying the per label cost to 12,000 labels results in an annual non-discounted, recurring cost of approximately $1 million or approximately $4,100 for each plant exporting processed products into the United States.

VI. Takings Analysis

A rule that requires companies to revise product labels has "takings implications" as defined under Executive Order 12630. Label inventories are private property. Inventories that are not exhausted by an effective date become non-compliant labels that would be essentially worthless and presumably discarded.

Executive Order 12630 requires that before taking private property for the protection of public health, the Department consider (1) the risk created by the property and (2) the potential cost to the government in the event that a court later determines that the action constituted a taking.

In this rulemaking, the relative public health risks and potential costs are both relatively small. The non-compliant labels represent a risk in that consumers would consume unknown levels of fat and cholesterol which could be higher than intended or perceived. Given the uncertainties concerning diet and health and the timeframes over which diet is expected to affect health, the unused inventories present a relatively small risk.

At the same time, the potential costs are relatively small. Based on Table 17 in Chapter IV, the label inventory transition costs for labels that would not be used before a 6-month compliance date would be $22.6 million. Similar costs for a 12-month compliance period would be $11.3 million.

Existing departmental guidance recommends considering feasible alternatives to the proposed action which would reduce the impact upon private property. The costs associated with unused label inventory could be reduced by allowing firms to either (1) use all existing label inventory that was procured prior to the proposal date, or (2) use existing inventory that includes some nutrition information.

Food Labeling; Reference Daily Intakes and Daily Reference Values; Mandatory Status of Nutrition Labeling and Nutrient Content Revision

AGENCY: Food and Drug Administration, HHS.

ACTION: Proposed rule.

SUMMARY: The Food and Drug Administration (FDA) is issuing this document to supplement, and to republish in modified form, its proposals entitled "Food Labeling; Mandatory Status of Nutrition Labeling and Nutrient Content Revision" (55 FR 29487, July 19, 1990) and "Food Labeling; Reference Daily Intakes and Daily Reference Values" (55 FR 29476, July 19, 1990). In those documents, the agency proposed to amend its food labeling regulations to require nutrition labeling on most foods that are meaningful sources of nutrients, to revise the list of required nutrients and food components and the conditions for declaring them in nutrition labeling, and to establish up-to-date reference standards for those nutrients and food components. FDA is now modifying those proposals and responding to the recent enactment of the Nutrition Labeling and Education Act of 1990 by proposing: (1) To add sugars and complex carbohydrates to the list of required nutrients in nutrition labeling; (2) to prescribe a simplified form of nutrition labeling and the circumstances in which such simplified nutrition labeling must be used; (3) to allow specified products to be exempt from nutrition labeling; and (4) to establish regulations for the nutrition labeling of vitamin and mineral supplements. The agency is also responding to a citizen petition regarding methodologies for determining protein quality.

DATES: Written comments by February 25, 1992. The agency is proposing that any final rule that may issue based upon this proposal become effective 6 months following its publication in accordance with requirements of the Nutrition Labeling and Education Act of 1990.

ADDRESSES: Written comments to the Dockets Management Branch (HFA-305), Food and Drug Administration, rm. 1-23, 12420 Parklawn Dr., Rockville, MD 20857.

SUPPLEMENTARY INFORMATION:

I. Background

In the **Federal Register** of July 19, 1990 (55 FR 29847), FDA published a proposed rule entitled "Food Labeling; Mandatory Status of Nutrition Labeling and Nutrient Content Revision" (hereinafter identified as the mandatory nutrition labeling proposal) to amend its food labeling regulations to require nutrition labeling on most food products that are meaningful sources of nutrients. FDA also proposed to revise the list of nutrients and food components that must be included in nutrition labeling by adding calories from fat, saturated fatty acids, cholesterol, and dietary fiber to that list. It proposed to make the listing of thiamin, riboflavin, and niacin optional rather than mandatory. In addition, FDA addressed the conditions under which other nutrients could be, or are required to be, included in nutrition labeling and proposed to allow manufacturers to voluntarily include a nutrition profile of selected food components in nutrition labeling.

In the same issue of the **Federal Register**, FDA published two technical supporting proposals. The first, entitled "Food Labeling; Reference Daily Intakes and Daily Reference Values" (hereinafter identified as "the RDI/DRV proposal") (55 FR 29476), proposed: (1) To replace the current U.S. Recommended Daily Allowances (U.S. RDA's) with Reference Daily Intakes (RDI's); (2) to establish RDI's for protein and for 26 vitamins and minerals; (3) to establish RDI's for five groups: Adults and children 4 or more years of age, children less than 4 years of age, infants, pregnant women, and lactating women; and (4) to establish Daily Reference Values (DRV's) for adults and children 4 or more years of age for eight food components considered important to the maintenance of good health: Fat, saturated fatty acids, unsaturated fatty acids, cholesterol, carbohydrate, dietary fiber, sodium, and potassium. The second technical, supporting proposal, entitled "Food Labeling; Serving Sizes" (hereinafter identified as "the serving size proposal") (55 FR 29517), proposed: (1) To define serving and portion size on the basis of the amount of food commonly consumed per eating occasion by persons 4 years of age or older, by infants, or by children under 4 years of age (toddlers); (2) to require the use of both U.S. and metric measures to declare serving size; (3) to permit the declaration of serving (portion) size in familiar household measures; (4) to permit the optional declaration of nutrient content per 100 grams (g) (or 100 milliliters (mL)); (5) to define a "single serving container" as that which contains 150 percent or less of the standard serving size for the food product; and (6) to establish standard serving sizes for 159 food product categories to ensure reasonable and uniform serving sizes upon which consumers can make nutrition comparisons among food products. Interested persons were given until November 16, 1990, to submit comments to the agency on these three proposed rules.

On September 26, 1990, the National Academy of Sciences' (NAS) Institute of Medicine (IOM) issued a report entitled "Nutrition Labeling, Issues and Directions for the 1990s." (the IOM Report) (Ref. 1). The IOM report, written under contract to the Public Health Service, U.S. Department of Health and Human Services and the Food Safety and Inspection Service, U.S. Department of Agriculture (USDA), makes recommendations for changes in food labeling that will assist consumers in implementing the recommendations of the Surgeon General's Report on Nutrition and Health (Ref. 2) and the National Research Council report, "Diet and Health, Implications for Reducing Chronic Disease Risk" (Ref. 3). On October 5, 1990, FDA published in the **Federal Register** (55 FR 40944) a notice announcing the availability of the IOM report and requested interested persons to comment on the implications of the report for the agency's July 19, 1990, proposals and for the other proposals that the agency has issued or will issue on food labeling.

On November 8, 1990, the President signed into law the Nutrition Labeling and Education Act of 1990 (the 1990 amendments) (Pub. L. 101-535). The 1990 amendments make the most significant changes in food labeling law since the passage of the Federal Food, Drug, and Cosmetic Act of 1938 (the act) and have a direct bearing on FDA's three July 19, 1990, proposals to revise nutrition labeling. The 1990 amendments add section 403(q) to the act which specifies, in part, that: (1) With certain exceptions, a food is to be considered misbranded unless its label or labeling bears nutrition labeling; (2) that certain nutrients and food components are to be included in nutrition labeling, although the Secretary can add or delete nutrients by regulation if he finds it necessary to assist consumers in maintaining healthy

dietary practices; (3) that nutrition labeling is to be provided for the most frequently consumed varieties of raw produce (fruits and vegetables) and raw fish according to voluntary guidelines or, if necessary, regulations; (4) that a simplified nutrition label is to be used when the food contains insignificant amounts of most nutrients; and (5) that FDA is to develop regulations governing labeling of foods to which section 411 of the act applies. The 1990 amendments also require FDA to develop and implement specific consumer education activities.

While the requirements of the 1990 amendments that pertain to nutrition labeling are similar in many respects to FDA's three proposals of July 19, 1990, differences do exist that require the agency to issue this supplementary proposal to amend the July 19, 1990, mandatory nutrition labeling proposal and to request further comment. Those aspects of the July 19, 1990, proposal that are not addressed in the preamble of this supplementary proposal remain unchanged from the mandatory nutrition labeling proposal or the RDI/DRV proposal. FDA is incorporating herein those portions of the July 19, 1990, preambles that relate to aspects of the mandatory nutrition labeling and RDI/DRV proposals that remain unchanged.

The agency is aware from a preliminary review of comments that some further changes to the mandatory nutrition labeling proposal may be necessary. For example, the agency has received comments requesting a change in the definition of saturated fatty acids. However, there has been insufficient time for the agency to thoroughly review all of the comments and make all appropriate changes before issuing this supplementary proposal. The agency is proposing below some changes as a result of its preliminary review of the comments where it believes that such changes will help to clarify the requirements of the mandatory nutrition labeling and RDI/DRV proposals. FDA is also responding to a petition on protein quality issues that it received before the enactment of the 1990 amendments.

Persons who have already submitted comments on issues raised by the mandatory nutrition labeling and RDI/DRV proposals that are not addressed in this preamble need not do so again unless they would like to amend their comments based on the changes made in this supplementary proposal or to submit comments on those changes. However, FDA is providing this opportunity for interested persons to submit comments on any issues addressed in the mandatory nutrition labeling proposal, the RDI/DRV proposal, or this supplementary proposal and on any and all aspects of these documents. FDA will consider and respond to all the comments that it receives on these documents in its final rule.

For clarity and completeness, the text of § 101.9 (21 CFR 101.9) set forth below includes the changes discussed in this supplementary proposal, the proposed provisions from the mandatory nutrition labeling proposal that have not been changed by this supplementary proposal, and the provisions of the current regulation to which the agency is either proposing no change or only minor nonsubstantive changes. To complete the section, the agency is also including the RDI and DRV values as proposed in the RDI/DRV proposal (55 FR 29476) (i.e., § 101.9 (c)(7)(iii), (c)(10)(iv), and (c)(11)(i), redesignated here as § 101.9 (c)(8)(iii), (c)(11)(iv), and (c)(12)(i)). There is nothing in the 1990 amendments that requires changes in the RDI/DRV proposal, and accordingly, the agency intends to analyze comments received on both the RDI/DRV proposal and this supplementary proposal and move toward a final regulation on these reference values with an effective date consistent with this rulemaking. Accordingly, the agency solicits any additional comments on the reference values and the groups for which RDI's are proposed.

Serving size, which is considered in proposed § 101.9(b), was addressed in the 1990 amendments but in a manner that is fully consistent with the agency's proposal (55 FR 29517). However, a preliminary review of the comments on the serving size proposal revealed significant disagreement. As a result, FDA is reconsidering its tentative position on serving size and intends to address this subject in a subsequent document. Therefore, FDA is not including proposed § 101.9(b) in the regulatory language at the end of this document.

Because the establishment and use of standard serving sizes is a new endeavor for the agency, FDA issued a notice on February 26, 1991 (56 FR 8084), announcing a public meeting to further discuss issues related to how serving size should be determined and presented as a part of nutrition labeling. The meeting was held on April 4, 1991, in Washington, DC. The agency was requested to hold an additional public meeting on the RDI/DRV proposal. However, FDA denied this request because it did not believe it could justify another public meeting given the resources and time constraints under which it is working to meet the requirements of the 1990 amendments (Ref. 3a). Unlike the serving size issue, the establishment of reference values for nutrition labeling has been a practice of the agency for almost 20 years and is based on well-recognized scientific and dietary guideline documents.

II. Mandatory Nutrition Labeling—Legal Authority

Before the passage of the 1990 amendments, the act did not specifically mention nutrition labeling. In the mandatory nutrition labeling proposal, however, FDA tentatively concluded that it had authority to require nutrition labeling on virtually all foods that are a meaningful source of nutrition. The agency found this authority in section 403(a)(1) of the act, which states that a food is misbranded if its label or labeling is false or misleading in any particular, section 201(n) of the act, which states that the labeling of a food is misleading if it fails to reveal facts material with respect to consequences that may result from use of the food, and section 701(a) of the act, which authorizes FDA to adopt regulations for the efficient enforcement of the act. In the mandatory nutrition labeling proposal (55 FR 29487 at 29492), the agency stated that:

> Given the history and use of nutrition labeling, the advances in nutrition science * * * and the public interest in healthful diets, FDA concludes that the nutritional content of a food is a material fact, and that a food label is misleading if it fails to bear nutrition information * * *.

The 1990 amendments confirmed the agency's authority to require nutrition labeling. Section 403(q) of the act states that a food shall be deemed to be misbranded if, with certain exceptions, it fails to bear nutrition labeling. Accordingly, FDA is proposing to revise § 101.9, as set forth below, to require nutrition labeling on all foods that are a meaningful source of nutrition under sections 201(n), 403(a)(1), 403(q), and 701(a) of the act.

III. Content of Nutrition Labeling

Section 403(q)(1) of the act, which was included in section 2(a) of the 1990 amendments, specifies that nutrition labeling shall include information on the total number of calories derived from any source; the number of calories derived from total fat; the amount of total fat, saturated fat (i.e., saturated fatty acids), cholesterol, sodium, total carbohydrates, complex carbohydrates, sugars, dietary fiber, total protein, and any vitamin, mineral, or other nutrient

required to be placed on the label under the act before October 1, 1990, if the Secretary determines that information about the vitamin, mineral, or other nutrient will assist consumers in maintaining healthy dietary practices. Section 403(q)(2) of the act states that other nutrients may be required by regulation to be included in the nutrition label, or required nutrients may be removed, if the Secretary determines that their placement on the label would (or would not) assist consumers in maintaining healthy dietary practices.

In regard to section 403(q) of the act's reference to vitamins, minerals, and other nutrients that were required to be placed on the label before October 1, 1990 (section 403(q)(1)(E) of the act), FDA notes that this reference is somewhat confusing. No vitamins, minerals, or other nutrients were required to appear on the label and labeling of food before October 1, 1990. The apparent reference is to 21 CFR 101.9(c)(7)(iii), which provides that when nutrition labeling is required, it must include vitamin A, vitamin C, thiamin, riboflavin, niacin, calcium, and iron. FDA is proposing to require the inclusion of all of these nutrients in the nutrition label except for thiamin, riboflavin, and niacin, whose declaration the agency proposed to make voluntary in its mandatory nutrition labeling proposal (55 FR 29487). The agency tentatively concluded that "Public health concerns for deficient intakes of these nutrients (thiamin, riboflavin, and niacin) have lessened considerably in the last 20 years," and, accordingly, proposed to delete them as a mandatory part of nutrition labeling. The IOM report also stated that thiamin, riboflavin, and niacin are not current public health issues and did not recommend that the disclosure of their levels in food be required (Ref. 1). Thus, because the agency tentatively finds that inclusion of these three nutrients in the nutrition label is not necessary to assist consumers in maintaining healthy dietary practices, under section 403(q)(2)(B) of the act, FDA is proposing to delete them from the list of nutrients that are mandatory elements of nutrition labeling.

A. Sugars and Complex Carbohydrates

The principal change that the 1990 amendments would require in FDA's mandatory nutrition labeling proposal is the addition of sugars and complex carbohydrates to the list of nutrients and food components that must be declared in nutrition labeling. Accordingly, to comply with the 1990 amendments, FDA is modifying proposed § 101.9(c)(6)(i) and (c)(6)(ii)(A) of the mandatory nutrition labeling proposal to make the declaration of complex carbohydrates and sugars mandatory.

In the mandatory nutrition labeling proposal, the agency proposed to make the declaration of these two food components voluntary. FDA set out the factors that it considered in deciding whether a nutrient or food component should be mandatory or voluntary in nutrition labeling:

> The agency has proposed to make the declaration of a nutrient or food component mandatory in nutrition labeling when quantitative intake recommendations with respect to the nutrient or component are highlighted in the reports cited above (e.g., "Reduce total fat intake to 30% or less of calories." * * *), and the nutrient or component is of particular public health significance as defined in several recent consensus documents * * *. On the other hand, for those nutrients or food components for which quantitative intake recommendations are not highlighted but that do have some public health significance (e.g., "* * * increase intakes of starches * * *" * * *), or for which quantitative recommendations are available but that are not of pressing public health importance (e.g., the Recommended Dietary Allowances for several vitamins and minerals * * *), the agency is proposing to make declaration of the nutrient or component voluntary.
>
> (55 FR 29487 at 29493.)

Accordingly, while several recent dietary guidelines recommend that intakes of sugars and sugar-rich foods be limited (Refs. 2, 3, and 4), FDA did not propose to require the mandatory declaration of sugars content because specific quantitative recommendations have not been provided. Similarly, dietary guidelines have recommended increased consumption of complex carbohydrates but have not clearly defined the term "complex carbohydrates" and also have not highlighted quantitative consumption goals (Refs. 2, 3, and 4). Thus, FDA did not propose to require the mandatory declaration of complex carbohydrates in nutrition labeling. The IOM report also recommended that the declaration of sugars and complex carbohydrates be voluntary (Ref. 1).

As stated above, section 403(q)(2)(B) of the act allows the Secretary to determine whether information relating to nutrients specified in section 403(q)(1)(C), (q)(1)(D), (q)(1)(E), or (q)(2)(A) is necessary to assist consumers in maintaining healthy dietary practices and, if not, to delete such nutrients from the required list of nutrients in nutrition labeling. Accordingly, FDA has considered its option to continue to make the inclusion of sugars and complex carbohydrates optional rather than mandatory elements of nutrition labeling. However, a preliminary review of comments received by the agency on the mandatory nutrition labeling proposal shows consumer interest in having sugars and complex carbohydrates as a mandatory part of nutrition labeling. In addition, while current dietary guidance recommendations (Refs. 2, 3, and 4) have not specified quantitative amounts, the general directions of the recommended modifications in current intakes—i.e., increase complex carbohydrates and limit sugars—are specified. Based on these factors FDA has tentatively concluded that consumers would find the inclusion of these food components useful in maintaining healthy dietary practices. Therefore, in accordance with the 1990 amendments and consistent with consumer comments, FDA is proceeding to amend its mandatory nutrition labeling proposal by proposing in § 101.9(c)(6)(i) and (c)(6)(ii)(A) to include sugars and complex carbohydrates as mandatory elements of nutrition labeling.

However, the preliminary review of comments also shows support for voluntary, rather than mandatory declaration of sugars and complex carbohydrates. The agency acknowledges that the mandatory approach is potentially controversial for several reasons, and that there is some basis to question the appropriateness of this approach. First, the inclusion of complex carbohydrates and sugars within the mandatory nutrition label may be misleading to consumers because it may suggest that these food components have greater public health significance than has been established by existing diet and health studies. More specifically, the identification of a specific benefit for complex carbohydrates is confounded by the fact that diets high in complex carbohydrates are usually mixed diets that contain significant amounts of cereal grains, fruits, and vegetables which are high in fiber, vitamins, and minerals and low in fat (Ref. 2). Thus, it is unclear the extent to which complex carbohydrates impart health benefits separate from such factors as the presence of fiber, vitamins, minerals, and reduced levels of fat. For sugars, the major public health concern relates to the relationship between sugars and dental caries. However, other factors, such as the characteristics of the food that contains the sugars (e.g., stickiness), the frequency of consumption, and the sequence in a meal, appear to be as

important in the etiology of dental caries as the sugars themselves (Refs. 2 and 3).

Second, as noted above, the Surgeon General's report (Ref. 2) and NAS's Diet and Health report (Ref. 3) have not specified a recommended level of intake for either complex carbohydrates or sugars. FDA has tentatively concluded that without targeted recommendations from these major consensus reports, it would not be appropriate to establish reference values, i.e., DRV's, for these food components. Moreover, FDA is proposing DRV's for all the other food components required to be declared in nutrition labeling except for protein, vitamin A, vitamin C, calcium, and iron, for which RDI's are being established. The agency anticipates that the reference value DRV's and RDI's will be helpful for consumers in planning overall diets, and the agency does not know the extent to which the absence of DRV's for complex carbohydrates and sugars will be problematic or confusing for consumers.

Third, the terms "complex carbohydrates" and "sugars" have not been clearly or consistently defined. While it is most appropriate to chemically define these terms in a way that reflects the physiological effects and health benefits associated with food substances, available consensus reports have not attempted to do so (Refs. 1 through 4). In its mandatory nutrition labeling proposal in which sugars and complex carbohydrates were proposed as voluntary, FDA proposed to define sugars as the sum of all free mono- and oligosaccharides and (and their derivatives) that contain four or fewer saccharide units (55 FR 29487 at 29513). This definition includes tri- and tetrasaccharides primarily to avoid underdeclaration of the sugars content of foods rich in corn syrups. It also includes sugar alcohols because they have sweetening, nutritional, and metabolic effects similar to sugars. This definition differs from that used by Canada (Ref. 5), the Codex Alimentarius Commission (Ref. 6), and the European Community (Ref. 7), all of which limit the definition of sugars to mono- and disaccharides.

FDA defined complex carbohydrates in the mandatory nutrition labeling proposal as the sum of dextrins and starches, i.e., those carbohydrate components that contain 10 or more saccharide units exclusive of dietary fiber (55 FR 29487 at 29497). However, the inclusion of dextrins (saccharide units of 10 or more) within the definition of complex carbohydrates may inappropriately classify the relatively low molecular weight carbohydrates in some nutritive sweeteners as complex carbohydrates. This definition may result in some foods, such as coffee whiteners and ice cream, that contain large amounts of low conversion (i.e., low dextrose equivalent) corn sweeteners being classified as sources of complex carbohydrates. These low molecular weight carbohydrates may have nutritional or metabolic effects different from those of commonly recognized complex carbohydrates. Thus, it may be misleading to consumers if these foods are labeled as containing complex carbohydrate.

FDA specifically requested comments on these suggested definitions and solicited alternative suggestions in the mandatory nutrition labeling proposal. FDA has not yet reviewed the comments that were submitted. Therefore, the agency has not modified the definition of sugars, although it has added a more precise definition of dextrins, as "saccharide units of 10 or more," to the definition of complex carbohydrates in § 101.9 (c)(6)(i).

Finally, from a compliance perspective, the proposed approach of including complex carbohydrates and sugars as mandatory elements of nutrition labeling poses certain analytical problems. Specifically, available and widely used laboratory methods provide for the analysis of carbohydrate in foods in a manner that may not be sufficiently specific for regulatory purposes. For example, available analytical procedures now measure carbohydrate as either more than 4 saccharide units or as single saccharide units up to 4 units. Suitable analytical procedures would be needed if complex carbohydrates were to be defined as those carbohydrates that contain a specified number of saccharide units that exceeds 4 (e.g., 10 units).

Therefore, because of all of these concerns and because this approach constitutes a change from the mandatory nutrition labeling proposal, FDA requests specific comments on its proposal to include complex carbohydrate and sugars as mandatory elements of nutrition labeling. The agency solicits comments concerning the utility and appropriateness, as well as the feasibility, of requiring declaration of complex carbohydrate and sugars content particularly as such declarations relate to and are supported by public health goals. If the mandatory declaration of these food components is considered necessary to assist consumers in maintaining healthy dietary practices, the agency further requests comments on the physiological effect of carbohydrate fractions, on appropriate chemical definitions and analytical methodologies for these substances, and on the impact, if any, of the absence of a DRV for these food components. Based on such comments and the other information that it has received, the agency will decide, under section 403(q)(2) of the act, whether to include complex carbohydrate and sugars in the required list of nutrients in nutrition labeling.

B. Protein Quality

While not directed to do so by the 1990 amendments, the agency is including in this supplementary proposal a modification of the mandatory nutrition labeling proposal regarding the determination of protein quality. This action is in response to a citizen petition submitted by Protein Technologies International, Inc. (Docket No. 90P–0052), requesting that the agency accept an amino acid scoring method that is corrected for protein digestibility in addition to the presently accepted procedure, the Protein Efficiency Ratio (PER) method. The agency has decided that the petition has merit, and that the agency's response to it should be integrated into this rulemaking because protein quality is an important part of nutrition labeling. Therefore, the agency is incorporating into this proposal most of the concepts from the petition and providing that any final rule based on this proposal will be a final disposition of the subject petition.

In the mandatory nutrition labeling proposal, FDA indicated that a more flexible approach to determining protein quality was desirable. The preamble stated:

> As new methodologies and new information on amino acid requirements of various age groups become available, the agency believes it must become more flexible in regard to permitted protein quality methodologies. Therefore, while the PER method described in the Official Methods of Analysis of the Association of Official Analytical Chemists may continue to be used as one of the methods for assessing the protein quality of foods, alternative acceptable validated procedures may be used as they become available.
>
> (55 FR 29487 at 29499).

Dietary protein serves as a source of essential and nonessential amino acids, the building blocks of body protein, and also as a source of energy. Because excess amino acids are not stored in the body, humans need a constant supply of good quality dietary protein to support growth and maintenance of body protein. Primarily, assessment of protein quality is a measure of the content,

proportion, and availability of essential amino acids in food protein. Accurate methods for determining protein quality are necessary because different food protein sources are not equivalent in their ability to support growth and body protein maintenance. When nutrition labeling regulations were promulgated in 1973, FDA used the PER method for measuring protein quality of foods and made a gross separation of protein types into high and low quality proteins with a separate U.S. RDA for each category (38 FR 2128, January 19, 1973). This method continues to be used in current regulations (§ 101.9(c)(7)(ii)).

The need for improved methods of assessing protein quality has been recognized for over a decade, but suitable alternative methods were not available. The PER method measures the ability of a protein source to support growth in young, rapidly growing rats. It is an expensive and time-consuming biological assay that compares weight gain in rats fed a test protein to the gain in rats fed a protein standard, casein. Moreover, as indicated in the agency's proposal on common or usual names for vegetable protein products (43 FR 30472, July 14, 1978), there has been increasing scientific data to demonstrate that the PER method for evaluating protein is not very precise for measuring protein quality for human needs. In brief, PER overestimates the value of some animal proteins for human growth and underestimates the value of some vegetable proteins because rapidly growing rats have a higher need for certain essential amino acids (Ref. 8, p. 4). The continued use of the PER method to assess comparative protein quality for food labeling purposes was discussed in a recent review article published in the *Journal of Nutrition* (Ref. 9).

Following publication of the mandatory nutrition labeling proposal, the Codex Alimentarius Commission accepted a method for assessing protein quality that uses a protein digestibility-corrected amino acid score (PDCAAS) (Ref. 9a, p. 80). This method had been recommended in a report from a joint expert consultative group of the Food and Agriculture Organization (FAO) of the United Nations and the World Health Organization (WHO) (Ref. 8). The standard used for assessing protein quality in the PDCAAS method is the amino acid scoring pattern established by FAO/WHO/United Nations University (UNU) in 1985 for preschool children 2 to 5 years of age (Ref. 10). To calculate PDCAAS, the test food is analyzed for protein and amino acid composition and the digestibility of the protein is determined with a standardized rat balance method. Overall, the most limiting essential amino acid (that is, the amino acid that is present at the lowest level in the test food compared to the standard) is identified in the test food by comparing the levels of individual amino acids in the test food with the FAO/WHO pattern of the essential amino acids established as a standard for children 2 to 5 years of age. The value of the most limiting amino acid (the ratio of the amino acid in the test food over the amino acid value from the pattern) is multiplied by the percent of digestibility of the protein. This resulting number is the PDCAAS.

The FAO/WHO/UNU report proposed separate amino acid scoring patterns for infants, preschool children 2 to 5 years of age, school-aged children 6 to 12 years of age, and adults, implying that protein quality varies with the age of the individual. The report stated that protein and diets containing essential amino acids that met the greater needs of young children were also adequate for older children and adults, whereas the reverse may not be true (Ref. 10). Five years later, the FAO/WHO consultative group evaluated the FAO/WHO/UNU report and concluded that there is no adequate basis to use different scoring patterns for different age groups with the exception of infants who have much greater needs for essential amino acids (Ref. 8). They recommended that the FAO/WHO/UNU amino acid scoring pattern for preschool children should be used to evaluate protein quality for all age groups, except infants. They also concluded that the protein digestibility-corrected amino acid score is the most suitable regulatory method for evaluating protein quality of foods, stating that "Since this method is based on human amino acid requirements, it is inherently more appropriate than animal assays used for predicting protein quality of foods and the Consultation therefore recommends that the procedure be adopted as the preferred method of measuring protein values in reference to human nutrition" (Ref. 8).

The agency has reviewed the FAO/WHO report and tentatively accepts its conclusion that the protein digestibility-corrected amino acid score method is more appropriate for assessing protein quality of foods than animal assays and is preferable for regulatory purposes. Therefore, the agency is proposing in § 101.9(c)(8)(ii) to require the use of the PDCAAS method as the method for determining protein quality for food intended for children over 1 year of age and adults. While this method is recommended for all children above 1 year of age, it is not recommended for infants, and therefore FDA proposes in § 101.9(c)(8)(ii) to retain the PER method for assessing protein quality and to retain casein as the standard in expressing the percentage of the RDI for protein in foods represented and purported to be for use by infants. FDA notes that there is an inconsistency between the FAO/WHO report cited above (Ref. 8) and a report of the meeting of the Codex Committee on Nutrition and Foods for Special Dietary Uses (CCNFSDU) which was held in February 1991 (Ref. 10a). While the CCNFSDU endorsed the use of the PDCAAS method, it adopted a higher standard for protein quality for children 1 to 3 years of age. The CCNFSDU report requires that "The amino acid score * * * should not be less than 70 percent of that of casein." The agency invites comments on the difference between the two reports especially with regard to issues of safety and public health of children between the ages of 1 and 3 years of age.

C. Terminology

1. Food Components

To be consistent with terminology used in the 1990 amendments, FDA is modifying the listing of "fat" to "total fat," "carbohydrates" to "total carbohydrates," "fiber" to "dietary fiber," and "saturated fatty acid" to "saturated fat." The agency had used the abbreviated terms "fat," "carbohydrate," and "fiber" to minimize space requirements for nutrition labeling. However, both the comments on the mandatory nutrition labeling proposal and research that the agency conducted in the fall of 1990 have shown that these abbreviated terms cause some consumer confusion (Ref. 11). FDA's research showed that many consumers did not realize that the "saturated fat" content was a part of the "fat" content, as listed (Ref. 11). The agency learned that many consumers think that it is necessary to add the grams of fat and the grams of saturated fat to get a total fat value (Ref. 11). While nutrition education programs are needed to address this issue, FDA believes that consumer confusion will be reduced by the use of the more explicit term "total fat."

Likewise, now that the agency is proposing to make complex carbohydrates and sugars mandatory elements of nutrition labeling, the use of the term "total carbohydrates" will help make clear that the term includes the two subelements listed beneath it. These

changes in terminology are supported by the IOM report which used the term "total fat" and recommends use of the term "total carbohydrate" when carbohydrate components are listed on the nutrition information panel, with the subgroups indented (Ref. 1).

In contrast to the listings for fat and carbohydrates, the agency does not believe there is a need to add the term "total" in front of "protein" because there are no other protein terms that are permitted to be listed. In addition, it may be helpful to minimize space requirements by the declaration of protein content since the percent RDI may be included on the same line (proposed § 101.9(c)(7)(i), redesignated as § 101.9(c)(8)(i) in this document). In regard to fiber, comments have stated that the use of the more precise term "dietary fiber" would help clarify the type of fiber being declared. FDA agrees with these comments and, as stated above, is using the suggested term in this supplementary proposal.

FDA is also proposing to require the use of the abbreviated terms "saturated fat," "unsaturated fat," "polyunsaturated fat," and "monounsaturated fat" in nutrition labeling in place of the more scientifically correct terms that include "fatty acid." The abbreviated terminology is used in the 1990 amendments and was recommended in the IOM report (Ref. 1). It also is consistent with terminology used in the dietary recommendations given in the Surgeon General's report (Ref. 2) and the Dietary Guidelines for Americans (Ref. 4). The agency has tentatively concluded that use of the abbreviated terms will help to reduce consumer confusion, as well as help to minimize space requirements within nutrition labeling.

2. Reference Values

In its mandatory nutrition labeling proposal (55 FR 29487), FDA acknowledged that the replacement of the U.S. RDA's with two sets of reference values, RDI's and DRV's, could potentially be confusing to consumers if both of the new terms were used on the food label. Although it is necessary to distinguish between RDI's and DRV's for regulatory purposes, FDA does not consider the distinction to be important to a consumer's understanding of the nutrition information presented on the food label. Therefore, FDA asked for comments on the possibility of listing the reference values on the label under a single new term.

On its own, FDA has arrived at "Daily Value" as a possibility for use as this single term. FDA believes that this term would be appropriate for two reasons. First, it is consistent with section 2(b)(1)(A) of the 1990 amendments, which directs the Secretary to require that information on the nutrition label be presented in a manner that enables consumers to understand the significance of the information presented in the context of a total daily diet. This term makes clear that the reference value is a daily intake level. Second, FDA has conducted consumer research that included discussions of the term "Daily Value" and, in general, the term was correctly interpreted by consumers (Ref. 11). However, consumers did suggest that the use of the word "value" was confusing. They commented that the word implied price or cost, rather than a reference standard.

The agency has received additional comments that also indicate that the term "Daily Value" may not be appropriate and has the potential to cause confusion. Alternative suggestions made to the agency include: Daily allowance, daily level, balanced daily allowance, recommended daily amount (or standard), daily limit, daily need, daily requirements, daily intake, and total daily value.

The agency is not proposing alternative terms that use words such as "recommended," "requirement," or "need" because such terms could be misleading to consumers and complicate nutrition education efforts. For example, some reference values are intended to guide consumers relative to maximum intakes (e.g., total fat), while others are intended to serve as a basis for planning general diets to meet nutrient requirements (e.g., vitamin C) or as minimum intakes (e.g., potassium). It would be incorrect to imply that FDA "recommends" that consumers consume the maximum intake level for total fats, or that such levels are "required."

FDA is, therefore, specifically reiterating its request for comment on, and suggestions for, appropriate terminology to be used to refer to both RDI's and DRV's when used as reference values on the food label, particularly as to the most meaningful and appropriate term to convey to consumers the purpose and intent of the reference values.

D. Fatty Acids

In its mandatory nutrition labeling proposal, FDA requested comments concerning the definitions of, and content declarations for, the different types of fatty acids (55 FR 29487). FDA stated that the available evidence does not support a cholesterol-raising effect for *trans* isomers when they are substituted for saturated fatty acids in the diet. New research and commentary have been published (Refs. 12 and 13), however, concerning the effect of *trans* isomers of fatty acids on the serum cholesterol levels. In view of these publications, the agency is requesting comments on the significance of the new findings for nutrition labeling and further requests that persons who submitted comments concerning *trans* isomers in response to the mandatory nutrition labeling proposal reevaluate their comments relative to the newest data and, if appropriate, submit additional or revised comments.

The agency also notes the increased use of fats containing long and very long chain fatty acids (e.g., components of partially hydrogenated menhaden oil) in the food supply and the potential for the marketing of novel compounds in which fatty acids are linked to carbon structures in a manner that will reduce their digestibility. As a result, these compounds will have the technical effects of fat without the calories. The agency is requesting comment concerning the appropriateness of current fat related definitions and analytical procedures for the declaration of these compounds with respect to mandatory nutrition labeling. FDA also requests the submission of the results of any research finding that will assist the agency in arriving at appropriate definitions for fatty acid groups.

In addition, definitions for "saturated" fatty acids and "unsaturated" fatty acids proposed by FDA are at variance with those of Canada (Ref. 5), the Codex Alimentarius Commission (Ref. 6), and the European Community (Ref. 7). Differing definitions among these organizations, Canada, and the United States could result in added analytical expenses for nutrition labeling and to support nutrition claims for internationally marketed products. The agency therefore requests comment on the need for internationally uniform fat definitions for purposes of labeling.

E. Additional Information

Section 2(b)(1)(C) of the 1990 amendments stipulates that regulations shall "permit the label or labeling of food to include nutrition information which is in addition to the information required by such section 403(q) and which is of the type described in subparagraph (1) or (2) of such section * * *." In its mandatory nutrition labeling proposal, FDA proposed to allow the voluntary declaration of several food components (e.g., unsaturated fat and soluble fiber) and any naturally occurring vitamins and

minerals for which RDI's have been proposed in § 101.9(c)(10)(iv), which is redesignated as § 101.9(c)(11)(iv) in this document. However, the agency requested comment on the merits of allowing a voluntary listing of nutrients and food components beyond those required in nutrition labeling. The agency raised questions about how the presence of these additional nutrients and food components on the label would be interpreted by consumers, and whether the listing of some voluntary nutrients and food components would actually be misleading (55 FR 29493). Through the inclusion of section 2(b)(1)(C) in the 1990 amendments, Congress would appear to have settled this issue, and, accordingly, the proposed regulations will continue to allow specified nutrients and food components, like unsaturated fat and soluble fiber, to be included voluntarily in nutrition labeling. However, the House Report on the 1990 amendments (Ref. 16) states that the regulations that FDA adopts should assure that the information that is included voluntarily does not interfere with the consumer's understanding of the information that is required to be included in the nutrition label. Therefore, FDA requests comment on whether it is necessary to include limits on the voluntary information that may be provided.

IV. Nutrition Label Format

As stated above, section 2(b)(1)(A) of the 1990 amendments states that implementing regulations shall "require the required information to be conveyed to the public in a manner which enables the public to readily observe and comprehend such information and to understand its relative significance in the context of a total daily diet." FDA interprets this provision as supporting the proposed DRV's and as a mandate for the agency to continue the effort that it began as part of Secretary Sullivan's food labeling initiative of conducting consumer research to determine the most useful and appropriate format for nutrition labeling.

FDA began its research by testing consumer reactions to alternative label formats in five consumer focus groups (Ref. 11). A focus group session is a qualitative information-gathering technique in which a group of 8 to 10 persons is guided through a discussion of a specific topic by a trained moderator. A session usually lasts about 1 to 2 hours. While the outcomes of these sessions are generally not quantifiable, they can help in guiding the design and interpretation of structured research projects and can provide useful insights into consumer behavior.

The agency's preliminary consumer focus group sessions were designed to provide qualitative information on four types of nutrition label formats, specifically bar graphs, pie charts, adjectival descriptors, and tabular numeric formats (Ref. 11). In designing the focus group sessions, FDA included specific comparison tasks or discussion issues that targeted the participants' ability to use and interpret the format. In this way, the discussions were structured to explore issues beyond stated preference and initial visual appeal. However, the extent to which familiarity with the current label influenced participants' responses could not be determined.

The outcome of the focus group discussions suggested that participants had difficulty using pie charts and bar graphs. In addition, formats based on adjectival descriptors, such as the use of the word "high" to designate the level of a nutrient in a food, did not increase participants' ability to compare levels of nutrients between foods. The tabular numeric format, which was similar to the current label, was readily used and most often appropriately interpreted by participants. Some participants suggested that this type of format required "less work" to interpret than bar graphs or pie charts. Virtually all participants favored some type of label standard or reference value for macronutrients and food components associated with chronic disease conditions (Ref. 11).

The agency also has conducted a large scale quantitative study to evaluate the communication effectiveness of five alternative label formats. The study employed a representative national sample of 1,000 adult primary food shoppers and a separate sample of 500 undereducated shoppers (Ref. 14). The criteria on which labels were evaluated included: Accuracy with which consumers distinguished between nutritionally dissimilar foods, time required to make distinctions, confidence in using formats, and rated helpfulness of formats for food selection and meal planning. Study respondents provided comments about the most helpful and least helpful features of the formats.

On May 20, 1991 (56 FR 23072), FDA published a notice in the **Federal Register** that announced the availability of a report of the results of this study. The notice also asked for comments on the study and on proposed additional format research.

Should FDA ultimately decide, based on comments and the results of the studies, that changes in the format of nutrition labeling appear to be necessary, it intends to propose those changes in time to include any such changes in the final nutrition labeling regulations that must be published by November 8, 1992.

The proposed DRV's were used in several formats studied in the focus group sessions as well as in some of those investigated in the quantitative study (Refs. 11 and 14). In these and other studies (Ref. 15), consumers indicated a desire to have reference values, such as the proposed DRV's, on food labels. A preliminary review of comments received on the mandatory nutrition labeling and RDI/DRV proposals also indicates great consumer interest in having these reference values become a part of nutrition labeling. The DRV's appear to help fulfill the requirements of section 2(b)(1)(A) of the 1990 amendments in that they enable consumers to "comprehend such information (i.e. nutrition labeling) and to understand its relative significance in the context of a total daily diet."

In light of these responses, the agency is of the opinion that use of the DRV's will help meet the objectives of the 1990 amendments and is therefore proposing to make them mandatory in some form. How they will be expressed within nutrition labeling and in what form is the subject of further format research. However, at this time FDA wishes to advise that it intends to require inclusion of DRV's in nutrition labeling, and it therefore requests further comments on how they might be expressed.

There are certain additional aspects of the current format that are directly affected by the 1990 amendments (i.e., highlighting, use of ranges, and a simplified format). A discussion of these matters follows.

A. Highlighting

Section 403(q)(1) of the act provides that "The Secretary may by regulation require any information required to be placed on the label * * * to be highlighted * * * by larger type, bold type, or contrasting color if the Secretary determines that such highlighting will assist consumers in maintaining healthy dietary practices."

FDA's current regulations do not address this issue. While many examples of highlighting of nutrients in nutrition labeling can be found in the marketplace, the agency has viewed the practice as a marketing activity rather than as a tool for educating or assisting consumers in planning a healthy diet. Highlighting is widely practiced by designers of print communications.

including food package designers, as a means of enhancing the readability of print materials. However, FDA has not conducted any research to determine the effectiveness of highlighting in directing consumer attention to specific nutritional information or in helping consumers to retain the highlighted information.

Comments are requested on the usefulness of highlighted information to consumers. For example, the agency asks for comments on what information, if any, should be highlighted; how, when, or where highlighting should be used; the circumstances in which it may be misleading (e.g., highlighting the cholesterol, but not the fat content of a food); and what costs are involved. Research findings would be particularly useful.

B. Ranges for Nutrients

Section 2(b)(1)(D) of the 1990 amendments directs FDA to permit the quantitative information on nutrition labeling to remain the same (i.e., to be stated as a single value) or to be stated as a range:

> * * * even though (i) there are minor variations in the nutritional value of the food which occur in the normal course of the production or processing of the food, or (ii) the food is comprised of an assortment of similar foods which have variations in nutritional value.

FDA, since 1973, has provided guidelines for deriving nutrition label values that are representative of the range of nutrients in a food. Under the guidelines, the label values are established by statistical analyses of data gathered to account for seasonal effects, growing/harvesting regions, storage, and other variables that affect nutrient content. This procedure, together with FDA's compliance standards in § 101.9(e)(4)(ii) and (e)(5) (renumbered as § 101.9(g)(4)(ii) and (g)(5) in this proposal), which allow up to a 20 percent deviation for naturally occurring nutrients, permits most foods to be represented by a single label value for each nutrient, even those that are quite variable.

The agency believes that single values calculated using this procedure are more informative, and are less confusing, for consumers than are ranges of values, especially where the ranges are large. It is true that requiring a single value may result in underdeclaration of some nutrients (e.g., vitamin C) and overdeclaration of others (e.g., sodium) when variability is high. However, the single value will fairly represent the nutrient levels that the consumer can depend upon receiving from the product over time. A single value also permits manufacturers to avoid frequent product analyses and label changes, and it requires that FDA take compliance action only if a label significantly misrepresents the nutrient content of a food.

The statistical procedures used by FDA are discussed in a guide, "Compliance Procedures for Nutrition Labeling," as noted in the mandatory nutrition labeling proposal (55 FR 29487 at 29507). This guide may be obtained from the Division of Nutrition, Center for Food Safety and Applied Nutrition (address above). A revised guide, to be entitled "FDA Nutrition Labeling Manual—A Guide for Using Data Bases," will be available by the time a final rule in this proceeding is issued. The revised guide will provide a more comprehensive discussion of procedures for using a data base to develop a nutrition label. It will also discuss some suggested alternatives to current procedures. In the revised guide, the agency will provide for the use of a mean value derived from a satisfactory data base for use in nutrition labeling in conformance with § 101.9(g)(4)(ii). In order to ensure that the data base is adequate for this purpose, a maximum coefficient of variation will be incorporated in the revised guide in addition to other requirements. The coefficient of variation is the standard of deviation (a measure of variability) expressed as a percentage of the mean. The mean value that may be used should be derived from an acceptable data base that meets the criteria given in detail in the booklet and summarized below:

Number of samples	Maximum coefficient of variation
5	17
10	25
20	31
30	34
40	36
50	37

Thus, if the sampling plan is acceptable to the agency, and the above number of samples are assayed, then, if the coefficient of variation is equal to or less than the maximum coefficient of variation applicable to the number of samples as specified above, the mean value may be used for labeling purposes instead of the calculated value using the agency formula.

The booklet detailing the requirements of an acceptable data base will have a more complete discussion of the use of mean values and calculated values and when each may be used for reasonable nutrient label values. The agency intends to publish a notice in the Federal Register when the revised guide is completed to provide an opportunity for public review.

FDA tentatively concludes that the agency's current compliance policy with respect to labeling in the face of nutrient variability, satisfies the requirements of the 1990 amendments. While the legislative history (Ref. 16) states that section 2(b)(1)(D) is to give the Secretary flexibility to permit nutrient values to be declared as a range, the agency does not believe that doing so will assist consumers in maintaining healthy dietary practices and, therefore, is not proposing any changes in its regulations in response to this section. However, the agency solicits specific comment on the use or display of ranges on nutrition labels.

C. Simplified Format

In an effort to keep the space requirements for the nutrition label to a minimum, FDA proposed in the mandatory nutrition labeling proposal that certain nutrients and food components (i.e., calories from fat, saturated fatty acids, cholesterol, fiber, vitamins, and minerals) could be omitted from the tabular listing if they are not present in the food or are present in very small amounts. When these nutrients and food components are omitted from the tabular listing, FDA proposed to require that the statement "Not a significant source of _____." with the blank filled in with the missing items, be included within the nutrition labeling (55 FR 29487 at 29502).

Section 403(q)(5)(C) of the act, takes a somewhat different approach. It states that:

> * * * If a food contains insignificant amounts, as determined by the Secretary, of more than one-half the nutrients required by subparagraphs (1) and (2) to be in the label or labeling of the food, the Secretary shall require the amounts of such nutrients to be stated in a simplified form prescribed by the Secretary.

In discussing label format issues, the IOM report (Ref. 1, p. 299) states that "There is an obvious tension between the goal of label uniformity, which will facilitate consumer use of nutrition labeling, and the possible need for modification for specific foods or markets." While the benefits of consistency in the presentation of nutrition information are stressed, the report also states that "It may be appropriate to allow foods that contain very few of the mandatory components of nutrition labeling to use an

abbreviated version of the standards format * * *."

Research conducted in conjunction with selection of the current nutrition label format showed that consumers of all educational backgrounds were consistently more accurate in identifying individual nutrient differences between foods, as well as in making overall comparative judgments about nutrition quality, when nutrients not present at significant levels were omitted from the nutrition label (Ref. 17). These results need to be weighed against other research that showed strong consumer preference for having all nutrients reported on the label rather than only those nutrients that are actually present in the food (Ref. 15).

To reflect the part of section 403(q)(5)(C) that states "* * * If a food contains insignificant amounts, as determined by the Secretary, of more than one-half the nutrients required by subparagraphs (1) and (2) to be in the label or labeling of the food * * *," FDA is proposing in § 101.9(f)(1) to consider all 15 nutrients and food components that would be mandatory under this proposal as "required nutrients." The 15 food components and nutrients to be included are: calories, calories from fat, total fat, saturated fat, cholesterol, total carbohydrate, complex carbohydrate, sugars, dietary fiber, protein, sodium, vitamin A, vitamin C, calcium, and iron. While the agency generally refers in this document to calories as a measure of energy; to fat, fatty acids, cholesterol, carbohydrates, fiber, protein, and sodium as food components; and to vitamins and minerals as nutrients, it is clear in section 403(q)(2)(B) of the 1990 amendments that all of these categories are included under the general term "nutrients." Accordingly, FDA is proposing to use all of them in calculating "* * * one-half the nutrients required * * *." Therefore, FDA interprets the language in section 403(q)(5)(C) quoted above as meaning that if a food contains insignificant amounts of 8 or more required nutrients, it is subject to the simplified format. To ensure that the determination as to when this format is required is not unnecessarily complicated, FDA is proposing not to count nutrients other than the 15 listed above as required nutrients, even if the nutrients are added to a standardized enriched food and therefore would have to be declared in nutrition labeling (§ 101.9(f)(1) and (3)(iii).

For purposes of determining when a food must bear the simplified format, section 403(q)(5)(C) of the act also directs the Secretary to determine when a food contains "insignificant amounts" of these required nutrients. For this purpose, FDA is proposing in § 101.9(f)(2) to define "insignificant amount" as that amount that may be rounded to zero in nutrition labeling.

To clarify the point at which very low levels of nutrients or food components may be rounded to zero, the agency is proposing additions in proposed § 101.9 to indicate precisely what analytical amounts may be rounded down to zero: § 101.9(c)(3), calories; § 101.9(c)(3)(i), calories from total fat; § 101.9(c)(3)(ii), calories from saturated fatty acids, unsaturated fatty acids, carbohydrates, and protein; § 101.9(c)(4), total fat; § 101.9(c)(4)(i), saturated fatty acids; § 101.9(c)(4)(ii), unsaturated fatty acids; § 101.9(c)(4)(ii)(A), polyunsaturated fatty acids; § 101.9(c)(4)(ii)(B), monounsaturated fatty acids; § 101.9(c)(6), total carbohydrate; § 101.9(c)(6)(i), complex carbohydrate; § 101.9(c)(6)(ii)(A), sugars; § 101.9(c)(6)(ii)(B), sugar alcohol; § 101.9(c)(7), dietary fiber; § 101.9(c)(7)(i)(A), soluble fiber; § 101.9(c)(7)(i)(B), insoluble fiber; and § 101.9(c)(8), protein. In the case of calories, which are proposed to be declared to the nearest 5–calorie increment in nutrition labeling (up to 50 calories), the amount specified that would be expressed as zero is "less than 5 calories." For total fat, total carbohydrate, complex carbohydrates, sugars, sugar alcohol, dietary fiber, soluble fiber, insoluble fiber, and protein, FDA is proposing less than 0.5 g as the amount that can be expressed as zero. For saturated fatty acids, unsaturated fatty acids, polyunsaturated fatty acids, and monounsaturated fatty acids, FDA is proposing less than 0.25 g as the amount that can be expressed as zero.

Current regulations (§ 101.9(c)(7)(i)) provide that vitamin and mineral values of less than 2 percent of the U.S. RDA are to be declared as zero. This provision was carried forward in the mandatory nutrition labeling proposal as proposed § 101.9(c)(10)(iii), now redesignated as § 101.9(c)(11)(iii). Consequently, FDA is proposing that a value of less than 2 percent of the RDI (set forth in proposed § 101.9(c)(10)(iv), redesignated in this document as § 101.9(c)(11)(iv)) be considered insignificant. This cutoff is supported by the imitation food regulation (§ 101.3(e)(4)(ii)) which identifies 2 percent or more of the RDI as a measurable amount of a nutrient. Anything less than a measurable amount could be considered "insignificant."

Current regulations (§ 101.9(c)(8)(i)) require that sodium content be declared as zero when less than 5 mg are present per serving (portion). This value is consistent with the definition of "sodium free." This requirement for zero declaration was carried forward in the mandatory nutrition labeling proposal in § 101.9(c)(8), which is redesignated as § 101.9(c)(9) in this proposal.

In the case of cholesterol, the agency proposed in § 101.9(c)(5) of its mandatory nutrition labeling proposal that a zero declaration of cholesterol be allowed when the cholesterol content of a food is less than 2 mg per serving (portion). This level is consistent with the definition of "cholesterol free" (55 FR 29456) that FDA has proposed.

Currently no single food composition data base has all of the information needed to determine what, or how many, foods would be required to bear the simplified format using the above criteria. Available data bases lack information particularly on sugars, complex carbohydrates, and dietary fiber. FDA utilized several available data bases to create a file that contains information on all required nutrients (Ref. 18). This file makes it possible to obtain some information on the types and number of traditional foods that would be required to bear the simplified format. Using this file, it appears that the proposed rules would require that the following types of foods bear the simplified format: beverages such as sweetened coffee and tea, soft drinks, and fruit and fruit-flavored drinks; fats and oils including some salad dressings; all types of sugar; sweets such as syrups, gelatin desserts, jams, jellies, and some candies; pickles; some condiments and sauces; salt and seasoning salts; and a limited number of grain products, fruits, and vegetables.

FDA is proposing in § 101.9(f)(3)(i) to prescribe a simplified format that resembles the minimum label requirements as described in the mandatory nutrition labeling proposal (55 FR 29487 at 29502) in that total calories, total fat, total carbohydrate, protein, and sodium would be declared as a minimum (i.e., as a core requirement). In addition, FDA is proposing in § 101.9(f)(3)(ii) that any other nutrients or food components that are required components of the full nutrition label and identified in § 101.9(f)(1) be declared in the simplified format if they are present in more than insignificant amounts.

The minimum label requirements stated in the mandatory nutrition labeling proposal allowed nutrients and food components (other than the core

requirements—that is, total calories, total fat, total carbohydrate, protein, and sodium) to be omitted from the tabular listing if a statement was added within the nutrition label stating "Not a significant source of _____," with the blank filled in by the missing nutrients or food components. The primary difference between that format and the simplified format being proposed here is that, as long as no additional nutrients (e.g., potassium) are declared, the nutrients or food components (other than the core requirements) that are required parts of the full nutrition label but that are present in insignificant amounts would not be identified on the simplified label. In these circumstances, manufacturers would not have to include the statement "Not a significant source of _____" on their label.

However, under proposed § 101.9(f)(4), if manufacturers voluntarily choose to declare additional nutrients or food components that are not among the 15 required nutrients (e.g., potassium), as allowed by section 2(b)(1)(C) of the 1990 amendments, they will then be required to use the statement "Not a significant source of _____," with the blank filled in with the name of any required nutrients or food components that are missing or present in insignificant amounts. The agency is also proposing in § 101.9(f)(4) that if the product is voluntarily enriched or fortified with added vitamins or minerals, any such nutrients must be declared within the simplified format and followed by the above statement. Such a voluntary addition of nutrients is viewed by the agency as an effort to market the food as a significant source of nutrients. The agency believes such action would be misleading under section 201(n) of the act unless consumers are advised about the full nutritional profile of the food.

However, as an exception, under proposed § 101.9(f)(3)(iii), standardized enriched foods that qualify for use of the simplified format may use this format without the added statement even though they include nutrients that are required by the standard to be added (e.g., thiamin, riboflavin, and niacin in enriched flour) but that are not among the 15 required nutrients.

This exception is being proposed because, in many cases, these standardized foods have been enriched because of the food standard and not at the choice of the manufacturer.

A nutrition label for a soft drink that uses the simplified format would state:

NUTRITION INFORMATION PER SERVING

Serving size	12 fl oz (360 mL)
Servings per container	1
Calories	145
Total fat	0 g
Total carbohydrate	36 g
Sugars	36 g
Protein	0 g
Sodium	20 mg

fl oz=fluid ounces
mg=milligram

However, a nutrition label using the simplified format for a vegetable oil that voluntarily declares polyunsaturated and monounsaturated fats would state:

NUTRITION INFORMATION PER SERVING

Serving size	1 tbsp (14 g)
Servings per container	64
Calories	130
Calories from total fat	130
Total fat	14 g
Saturated fat	2 g
Polyunsaturated fat	4 g
Monounsaturated fat	8 g
Total carbohydrate	0 g
Protein	0 g
Sodium	0 mg

Not a significant source of cholesterol, complex carbohydrate, sugars, dietary fiber, vitamin A, vitamin C, calcium, or iron.

To save space and to allow greater flexibility in presentation, FDA is proposing in § 101.9(f)(5) that nutrition information for the simplified format may be presented in vertical columns (as above) or in lines. Under the proposal, when a line presentation is used, any nutrients or food components that are subelements that would otherwise be indented under a principal element (e.g., saturated fat as a subelement of total fat) must be put in parentheses in the proper order. Examples of a line presentation for the two products listed above are as follows:

Nutrition Information

Serving size: 12 fl oz (360 mL)
Servings per container: 1
Per serving: 145 calories, 0 g total fat, 36 g total carbohydrate (36 g sugars), 0 g protein, 20 mg sodium.

Nutrition Information

Serving size: 1 tbsp (14 g)
Servings per container: 64
Per serving: 130 calories (130 calories from total fat), 14 g total fat (2 g saturated fat, 4 g polyunsaturated fat, and 8 g monounsaturated fat), 0 g total carbohydrate, 0 g protein, 0 mg sodium. Not a significant source of cholesterol, complex carbohydrate, sugars, dietary fiber, vitamin A, vitamin C, calcium, or iron.

To attract the consumer's attention to the smaller nutrition label, to clarify the information in the simplified format to the consumer, and in recognition of section 403(q)(1) of the act and of section 2(b)(1)(A) of the 1990 amendments, the agency is also considering the usefulness of requiring that the headings "NUTRITION INFORMATION" and "PER SERVING" be highlighted by larger type, bold type, or contrasting color. Comments are requested on this possible use of highlighting.

V. Exemptions

The 1990 amendments specifically exempt certain foods from the requirements of section 403(q) of the act. Some of these exemptions are the same as those included in FDA's mandatory nutrition labeling proposal. A discussion of the authority for these exemptions and, where differences exist, of the revised exemptions follows.

A. No Nutritional Significance

Section 403(q)(5)(C) of the act states:

> If a food contains insignificant amounts, as determined by the Secretary, of all the nutrients required by subparagraphs (1) and (2) to be listed in the label or labeling of food, the requirements of such subparagraphs shall not apply to such food if the label, labeling, or advertising of such food does not make any claim with respect to the nutritional value of such food. * * *

In accordance with this provision of the statute, FDA is revising proposed § 101.9(a). As set out in the mandatory nutrition labeling proposal, this section would have required that nutrition labeling be provided on all foods that are a meaningful source of calories or nutrients. The agency proposed that a food be classified as a "meaningful" source of calories or nutrients if it contained:

(1) Two percent or more of the RDI for protein, vitamin A, vitamin C, iron, or calcium per serving (portion);

(2) More than 40 calories per serving (portion) or more than 0.4 calories per g; or

(3) More than 35 mg of sodium per serving (portion).

FDA is compelled by the statute to revise proposed § 101.9(a) to exempt from nutrition labeling only those foods that contain insignificant amounts of all of the nutrients and food components required within nutrition labeling. Thus, consistent with the preceding discussion on the simplified format, the agency is proposing to define "insignificant" in

§ 101.9(a) as that amount that allows a declaration of zero in nutrition labeling.

FDA is also compelled by the statute to make this exemption available only when there are no nutrition claims in the label, labeling, or advertising for the food. FDA therefore has modified proposed § 101.9(a) to restrict the exemption for foods with insignificant amounts of nutrients to such situations. The proposed provisions point out that nutrition claims or information set forth in any context, and in any form of expression, implicit as well as explicit, will bar a food from an exemption from nutrition labeling under the "no nutritional significance" provisions.

B. Small Business

Section 403(q)(5)(D) of the act establishes a small business exemption by providing that:

> If a person offers food for sale and has annual gross sales made or business done in sales to consumers which is not more than $500,000 or has annual gross sales made or business done in sales of food to consumers which is not more than $50,000, the requirements of subparagraphs (1), (2), (3), and (4) (of section 403(q)) shall not apply with respect to food sold by such person to consumers unless the label or labeling of food offered by such person provides nutrition information or makes a nutrition claim.

This section of the statute requires a modification of the relevant provision that FDA included in the mandatory nutrition labeling proposal. That provision, § 101.9(h)(1), would have provided an exemption for foods offered for retail sale by firms that have an annual amount of food sales of not more than $500,000.

Under section 403(q)(5)(D) of the act, however, a food product is exempt from nutrition labeling if it is offered for sale by a person who has annual gross sales made, or business done in sales, of food and other merchandise to consumers of not more than $500,000 or annual gross sales made, or business done in sales, of food alone of not more than $50,000. Accordingly, the food products sold by a company would be exempt if the company had annual gross sales, made, or business done in sales, to consumers of more than $500,000 but less than $50,000 worth of sales made, or business done in sales, of food to consumers, or if it had annual gross sales, or business done in sales, to consumers of less than $500,000 even though it had more than $50,000 worth of sales made, or business done in sales, of food to consumers. Only businesses having more than $500,000 in gross sales made, or business done in sales, to consumers and more than $50,000 in sales, or business done in sales, of food alone to consumers would not be exempt. Proposed § 101.9(h)(1), redesignated in this proposal as § 101.9(j)(1), has been revised accordingly.

For the purposes of this regulation, FDA is proposing in § 101.9(j)(1)(ii) that a person who offers food for sale, or who has business done in sales, to consumers is any person who manufactures, packs, or distributes food for ultimate sale to consumers at the retail level, as well as any person directly involved in the retail sale of foods to consumers. This proposed provision clarifies the coverage of the small business exemption.

As discussed in the June 13, 1990, report of the Committee on Energy and Commerce, House of Representatives (Ref. 16), wholesale business, that is, sales not involving consumers, is not included in calculations of gross sales. Sales from all stores or other outlets owned by a particular corporation or other business, however, must be added together in determining whether the business qualifies for the exemption (Ref. 16).

In proposed § 101.9(j)(1)(iii), FDA is carrying forward from the mandatory nutrition labeling proposal its position that the calculation of the amount of sales should be based on the most recent two year average of business sales, and that, where firms have been in business less than two years and wish to claim the small business exemption, reasonable estimates of sales must indicate that annual sales will not exceed the dollar amounts specified. The agency recognizes that foreign firms may also be entitled to the small business exemption. In order to provide comparable treatment to such firms, FDA is proposing in § 101.9(j)(1)(iii) that the total sales of a foreign firm in the United States would be the level of business activity used in determining whether the firm has less than $500,000 sales to consumers or less than $50,000 in food sales to consumers.

C. Restaurant Food

Sections 403(q)(5)(A)(i) and (ii) of the act exempt from the nutrition labeling requirements foods that are served in restaurants or similar food service establishments, that are principally processed and prepared in a retail establishment, that are ready for consumption although not necessarily for consumption at the place of sale, and that are not offered for sale outside the establishment. FDA tentatively concludes that proposed § 101.9(h)(2) and (h)(3), which are redesignated as § 101.9(j)(2) and (j)(3) in this document, appropriately reflect these provisions of the legislation. Therefore, FDA is not modifying § 101.9(j)(3). However, to reflect the exemption contained in section 403(q)(5)(F) of the act, FDA is modifying § 101.9(j)(2) to exempt foods sold by a distributor who sells principally to restaurants and other food service establishments from the nutrition labeling requirements. Manufacturers, packers, or distributors of foods for restaurant use should nutrition label their food products if there is a reasonable possibility that the food will be purchased directly by consumers (Ref. 25).

D. Small Packages

Section 403(q)(5)(B) of the act provides an exemption from nutrition labeling on labels of foods that are in packages that are so small that it is impracticable to comply with the statutory requirements and that do not contain any nutrition information. According to the House Committee Report (Ref. 16):

> * * * In order to qualify for the exemption, the Secretary must find that the information on the label would be difficult to read, while leaving a reasonable amount of room for the name of the product and other information that is required by law to be on the label. * * *

FDA had attempted to exempt very small packages by proposing an exemption in § 101.9(h)(11) for small individually packaged "bite-size" pieces of food. The agency has been made aware of the confusion over the term "bite size" through the number of requests it has received to define it. Therefore, in response to the 1990 amendments and to the requests for clarification that it has received, FDA is revising proposed § 101.9(h)(11), which is redesignated as § 101.9(j)(11) in this document, to specify a standard for a package that is sufficiently small to be exempt from nutrition labeling. To promote consistency within its food labeling regulations, the package size that the agency is proposing as its standard is the same package size that it uses as the standard in § 101.2(c)(3)(i) for exempting small packages of foods from type size requirements, namely that the "package is designed such that it has a total surface area available to bear labeling of less than 12 square inches." Thus, under this proposal, foods sold in packages of this size or smaller will not be required to bear nutrition labeling on their label unless, as provided in section 403(q)(5)(B) of the act, nutrition information (e.g., nutrition claims) is presented on the label.

By focusing on the size of the label, FDA is complying with the direction from the House Committee on Energy

and Commerce (Ref. 16, p. 16) that the agency not permit manufacturers to avoid section 403(q) of the act by increasing the size of the name and other legally required information so that insufficient space is left for nutrition information. Because the size of the label is the deciding factor in determining eligibility for the exemption, the manufacturer is left with the responsibility for determining how the required information is to be fit into the available label space if that space is of the requisite size.

FDA believes, however, that nutrition information about the food in very small packages can still be provided to consumers through alternative means. Section 403(q)(5)(B) of the act states only that the nutrition labeling requirements shall not apply to the label of the food. It says nothing about the labeling. The absence of clear statutory direction for labeling exemptions for these packages gives the agency discretion to decide whether labeling should also be exempted. Under these circumstances, FDA believes that it should only provide an exemption for this labeling if compliance with nutrition labeling requirements is impracticable. FDA knows of no reason why firms could not provide nutrition information on placards or through display of the label for the container in which the small packages are shipped (e.g., the label of a box containing "penny candy"). Therefore, the agency is proposing in § 101.9(j)(11) to require that nutrition information that would otherwise be required on the label be displayed clearly at the point of purchase according to § 101.9(a)(2) for food not in packaged form.

The agency believes that relatively few food packages will qualify as "small" under the proposed exemption. FDA has reviewed information from the agency's 1982 Food Labeling and Packaging Survey (FLAPS) and found that, for the foods in the survey, the proposed exemption for packages with less than 12 square inches of total surface area available for labels would primarily exempt candy rolls, breath sweeteners, and a few very small individual-serving size canned foods (Ref. 19). However, because FLAPS did not consider every brand of food in the marketplace, additional foods may be included.

E. Medical Foods

Section 403(q)(5)(A)(iv) of the act exempts medical foods from the nutrition labeling requirements. This section defines a "medical food" by incorporating by reference the definition in section 5(b) of the Orphan Drug Act (21 U.S.C. 360ee(b)(3)). Medical foods are currently exempted from the nutrition labeling regulations in § 101.9(h)(4), which was redesignated as § 101.9(h)(7) in the mandatory nutrition labeling proposal.

FDA is amending proposed § 101.9(h)(7) (and redesignating it as § 101.9(j)(7)) to reflect the wording of the explicit exemption of medical foods in the act and to incorporate the statutory definition of "medical food" into the nutrition labeling regulations. That definition is:

> The term *medical food* means a food which is formulated to be consumed or administered enterally under the supervision of a physician and which is intended for the specific dietary management of a disease or condition for which distinctive nutritional requirements, based on recognized scientific principles, are established by medical evaluation.

The agency advises that it considers the statutory definition of medical foods to narrowly constrain the types of products that can be considered to fall within this exemption.

For the efficient enforcement of the act, under section 701(a), FDA is proposing to clarify this definition by providing criteria in § 101.9(j)(7) for use in identifying a medical food. These criteria are based on the agency's expertise on medical foods and on a survey of the literature on this subject.

Medical foods are distinguished from the broader category of foods for special dietary use and from foods that make health claims (e.g., fiber in relation to cancer) by the requirement that medical foods be used under medical supervision. In general, to be considered a medical food, a product must, at a minimum, meet the following criteria: The product must be a food for oral or tube feeding; the product must be labeled for the dietary management of a specific medical disorder, disease, or condition for which there are distinctive nutritional requirements; and the product must be intended to be used under medical supervision (Ref. 20).

The term "medical foods" does not pertain to all foods fed to sick patients. Medical foods are foods that are specially formulated and processed (as opposed to a naturally occurring foodstuff used in its natural state) for the patient who is seriously ill or who requires the product as a major treatment modality. Typical medical foods are enteral nutrition products. Enteral nutrition is defined as nutrition provided through the gastrointestinal tract, taken by mouth, or provided through a tube or catheter that delivers nutrients beyond the oral cavity (i.e., directly to the stomach) (Ref. 21). Medical foods may require special quality control procedures, adequate and appropriate directions for use, and substantiation of labeling claims (Ref. 22). They are generally not available on the retail shelf.

Medical foods are intended for the partial or exclusive dietary management of patients under medical supervision who, because of specific therapeutic or chronic medical needs, have limited or impaired capacity to ingest, digest, absorb, or metabolize ordinary foodstuffs or certain nutrients, or who have other special medically determined nutrient requirements, the dietary management of which cannot be achieved by the modification of the normal diet alone (Ref. 22). Medical foods are intended for the dietary management of such patients by providing nutrition specifically modified to include as many nutrients as necessary while minimizing adverse signs and symptoms that might result from the provision of other nutrients that are not ingested, digested, absorbed, or metabolized normally by the patient (Ref. 22).

The statute requires that a medical food be consumed or administered enterally under the supervision of a physician. *Under the supervision of a physician* means that the intended use of a medical food is for the dietary management of a patient receiving active and ongoing medical supervision (e.g., in a health care facility or as an outpatient). The physician determines that the medical food is necessary to the patient's overall medical care. The patient sees the physician on a recurring basis for, among other things, instructions on the use of the medical food.

Medical foods are not foods that are simply recommended by a physician or other health care professional as part of an overall diet designed to reduce the risk of a disease or medical condition or as weight loss products. Moreover, medical foods are not dietary supplements for the general population that can be openly purchased from retail shelves or by mail order, although it is true that dietary supplements may be recommended by a physician for a specific condition or disease. The intended use and degree of medical oversight for these latter products is not sufficient to qualify them as medical foods, and such products will continue to be regulated as foods for special dietary use.

Single ingredient nutrient products that are promoted for the treatment of specific disease states will continue to be regulated under existing drug law

(e.g., zinc sulfate for the treatment of acrodermatitis enteropathica), as will all injectable nutrient formulations (Ref. 20). Parenteral nutrients also are drugs and not medical foods. By definition, medical foods are consumed or administered enterally (21 U.S.C. 360ee(b)(3)).

FDA's traditional policy has been to regulate medical foods as foods for special dietary use. However, in light of the existing definition of foods for special dietary use and the definition of medical food that has been enacted by Congress (see 21 U.S.C. 350(c) and 360ee(b)(3)), FDA is reevaluating its policy. FDA intends to address the issue of medical foods at length in a future Federal Register document.

Section 101.9(h)(7), as proposed in the mandatory nutrition labeling proposal, contained the phrase, "* * * except that such products shall be labeled in compliance with part 105 of this chapter" (55 FR 29487 at 29516). FDA recognizes that there are currently no regulations in 21 CFR part 105 or elsewhere in the CFR that specify labeling requirements for medical foods. To avoid confusion to readers of this proposal, the agency is deleting this phrase until at least such time as labeling regulations are developed for these foods. However, FDA believes that the proper labeling of the nutrient content and purported uses of medical foods, perhaps in a different manner or in more detail than is required for other, more traditional foods, and adequate and appropriate directions for use, as well as assurances of the quality of medical food products, are all of vital public health interest. Therefore, the agency intends to develop regulations covering these aspects of medical foods in the near future.

F. Infant Formula

Section 403(q)(5)(A)(iii) of the act specifically exempts infant formula from the nutrition labeling requirements. In its mandatory nutrition labeling proposal (55 FR at 29505), the agency proposed to exempt infant formula from nutrition labeling because it is already subject to special labeling requirements which are set out in 21 CFR part 107. (See proposed § 101.9(h)(4).)

FDA is now proposing § 101.9(j)(6) to incorporate the statutory exemption for infant formula into its regulations. Further, the agency is proposing to add the phrase, "except that such foods shall be labeled in compliance with part 107 of this chapter," to direct the reader to the location of the appropriate regulations for the labeling of infant formula

G. Foods Represented for Use as the Sole Item of the Diet

Foods represented for use as the sole item of the diet currently are exempted from the nutrition labeling regulation by § 101.9(h)(3) (redesignated in the mandatory nutrition labeling proposal as § 101.9(h)(6)) with the proviso that "such foods shall be labeled in compliance with part 105 of title 21, Chapter 1, Code of Federal Regulations." Section 403(q)(5) of the act does not provide a specific exemption for foods represented for use as the sole item of the diet. Further, the agency recognizes that there are no regulations in 21 CFR part 105 at this time that explicitly deal with the labeling of such foods. Therefore, FDA has reconsidered the proposed exemption.

The agency is not aware of any reason why foods that are neither medical foods nor infant formula, but that are represented as the sole item of the diet (e.g., formulated weight loss products), should not be labeled with at least the amount of nutrition-related information that is now being proposed for traditional foods in the general food supply. Accordingly, FDA is deleting the exemption for foods represented for use as the sole item of the diet from its proposed regulations. After the current round of rulemaking to implement the 1990 amendments to the act, FDA will consider whether there should be additional or different requirements for the nutrition labeling of these products. The exemption can then be established if regulations are developed to deal specifically with these foods.

H. Foods Shipped in Bulk Form

Section 403(q)(5)(A)(v) of the act exempts food described in section 405(2) of the act from nutrition labeling. Section 405(2) of the act exempts from any labeling requirement food that is to be processed, labeled, or repacked at a site other than that where it was originally processed or packed. Such food is currently exempted by § 101.9(h)(8), redesignated in this supplementary proposal as § 101.9(j)(8). The redesignated § 101.9(j)(8) has been revised to more closely reflect the statutory language of section 405(2) of the act.

I. Raw Agricultural Commodities and Raw Fish

Section 403(q)(4) of the act provides for the dissemination of nutrition information for raw fruit, vegetables, and fish to consumers at retail locations. The act provides that by November 8, 1991, FDA is to issue:

(1) Voluntary guidelines that advise food retailers on how to provide the nutrition information specified in the statute to consumers;

(2) Regulations that identify the 20 varieties of most frequently consumed raw vegetables, fruit, and fish to which the guidelines will apply; and

(3) Regulations that define the circumstances that constitute substantial compliance by retailers with the guidelines.

After issuing these guidelines and regulations, the agency is to survey retailers of raw produce and fish, and by May 8, 1993, it is to issue a report on actions taken by food retailers to provide consumers with nutrition information under the voluntary guidelines. If the agency finds that food retailers are in substantial compliance with the guidelines, it need not take any further action for 2 years, at which time, it is to conduct a new survey. This cycle will repeat every 2 years. If, however, the agency finds that there is not substantial compliance with the guidelines, it is directed to issue proposed regulations that mandate nutrition labeling on the top 20 varieties of raw fruit, vegetables, and fish.

FDA is taking steps to implement this section of the 1990 amendments. First, the agency is withdrawing the exemption that it proposed (§ 101.9(h)(10) (55 FR 29516)) for fresh fruit and vegetables in containers of not more than 1 dry quart. FDA proposed to exempt these containers because of the statutory exemption for fresh produce in small containers in section 405(1) of the act. The 1990 amendments, however, provide that this exemption does not apply to nutrition labeling and health claims (section 5 of the 1990 amendments).

Secondly, consistent with section 403(q)(4)(A) of the act, FDA is proposing in § 101.9(j)(10) to exempt raw fruits and vegetables and raw fish from the nutrition labeling regulations. FDA will propose to remove this exemption if, and when, the agency finds that there is not substantial compliance with the voluntary guidelines. In exempting raw fish, FDA interprets the exemption of the 1990 amendments to apply to unpackaged raw fish and to fish packaged by the retailer for immediate sale, not to products such as frozen fish fillets or canned oysters that are packaged by the manufacturer or packer for direct sale to the consumer. Because these products have been processed in some way and not simply iced, they cannot be considered to be raw for purposes of section 403(q)(4)(B)(i)(II) of the act. Fish products such as frozen

fillets and canned oysters are required to bear nutrition labeling under the act.

Thirdly, FDA published in the **Federal Register** (56 FR 30468, July 2, 1991) proposed voluntary guidelines for labeling raw produce and fish; a proposed regulation that defines the applicability of the guidelines by listing the 20 most frequently consumed varieties of raw fruits, vegetables, and fish; and a proposed regulation that defines "substantial compliance" with the voluntary guidelines. This action is being followed by publication elsewhere in this issue of the **Federal Register** of the guidelines and final regulations. In addition, FDA is planning for the biennial survey of food retailers.

J. Foods Sold From Bulk Containers

Section 403(q)(3) of the 1990 amendments states: "For food that is received in bulk containers at a retail establishment, the Secretary may, by regulation, provide that the nutrition information required by subparagraphs (1) and (2) be displayed at the location in the retail establishment at which the food is offered for sale." Congress intended that this section cover foods received in, and sold from, bulk containers where the consumer selects and packages the food (Ref. 16).

In its mandatory nutrition labeling proposal, the agency stated its intention that foods sold from bulk containers be nutritionally labeled:

> * * * Many foods, such as candies, cookies, and pasta, are offered for sale from large containers such as barrels or bins. FDA has traditionally required that these foods be labeled in accordance with section 403(i)(2) of the act through the use of a counter sign or card on the labeling of the bulk container (21 CFR 101.100(a)(2)). The agency believes that nutrition labeling can be provided in a similar manner. Therefore, the agency proposes to require nutrition information for such foods. (55 FR 29505)

The agency continues to believe that nutrition labeling can, and should, be presented on the labeling of the bulk container or on a counter card, sign, or other appropriate device as identified in § 101.100(a)(2) for ingredient labeling of bulk foods. This position is supported by the legislative history (Ref. 16) that points to the impracticality of requiring nutrition labeling to be printed on the bags that the consumer would put the food into for purchase.

To prevent any confusion or misunderstanding on this issue, FDA is proposing to add an exemption, § 101.9(j)(14), for foods sold from bulk containers at a retail establishment provided that the nutrition labeling be displayed prominently and conspicuously at the point of purchase.

VI. Other Nutrition Labeling Provisions

A. Corrections

The agency is proposing to make a few nonsubstantive changes to its mandatory nutrition labeling proposal to make the following corrections:

(1) In its mandatory nutrition labeling proposal, the agency inadvertently omitted a sentence in proposed § 101.9(c)(4)(ii) that specifies how the amount of unsaturated fat is to be expressed on the nutrition label. FDA has corrected this omission by adding a sentence that states that unsaturated fat is to be declared in grams, to the nearest gram, with exceptions noted if the amount present is less than 1 g.

(2) In proposed § 101.9(c)(6), the agency redefined carbohydrate to exclude dietary fiber. The result of this proposed change is that the definition of a carbohydrate would no longer include those components that were traditionally considered part of carbohydrates but that are not digested and, therefore, do not contribute calories to the diet. However, the agency overlooked that a parallel change was needed in § 101.9(c)(3) to delete the direction to subtract dietary fiber from carbohydrate when determining the number of calories by the general Atwater factors of 4, 4, and 9 calories per gram for protein, carbohydrate, and fat, respectively. To correct this oversight, FDA is proposing to amend § 101.9(c)(3) to no longer require the subtraction of dietary fiber from carbohydrate since this correction has already been made in defining carbohydrate content. The agency also is proposing in § 101.9(c)(6) to add a more complete description of the method to be used in calculating total carbohydrate by subtracting the sum of crude protein, total fat, dietary fiber, moisture, and ash from the total weight of the product.

(3) In the mandatory nutrition labeling proposal, the paragraphs pertaining to dietary fiber (§ 101.9(c)(6)(iii) through (c)(6)(iii)(B)) were placed within the larger section pertaining to carbohydrates (§ 101.9(c)(6)). Because FDA is defining total carbohydrate to exclude dietary fiber, the agency believes that there will be less confusion if the paragraphs relating to dietary fiber are redesignated as § 101.9(c)(7). Therefore, the agency is proposing this redesignation and, consequently, the redesignation of the remaining paragraphs within § 101.9(c).

(4) The last sentence in proposed § 101.9(c)(10)(ii) in the mandatory nutrition labeling proposal is repeated in the last sentence in proposed § 101.9(c)(10)(iii). FDA is proposing to eliminate this unnecessary repetition by deleting the sentence from the paragraph now redesignated as § 101.9(c)(11)(iii).

(5) In § 101.9(c)(11)(i) which was published as part of the RDI/DRV proposal, the agency referred to the reference caloric intake of 2,350 calories as the "* * * population-adjusted mean of the recommended caloric intake (i.e., 2,350 calories)." While this statement correctly refers to the NAS's recommended caloric intakes (Ref. 24), some persons were confused, interpreting the statement to mean that FDA was recommending a caloric intake of 2,350 calories. To prevent this erroneous interpretation, FDA is proposing to amend § 101.9(c)(11)(i), now redesignated as § 101.9(c)(12)(i), to state "* * * a reference caloric intake of 2,350 calories * * *."

(6) To be consistent with the manner in which percent RDI's are reported in nutrition labeling, the agency is proposing to include a requirement in § 101.9(c)(12) that when a nutrition profile is given, the percent DRV's be expressed in 2-percent increments up to and including the 10-percent level, 5-percent increments above 10 percent and up to and including the 50-percent level, and 10-percent increments above the 50-percent level. The mandatory nutrition labeling proposal did not specify this manner of declaring amounts.

(7) In the RDI/DRV proposal, the agency proposed DRV's for total fat (75 g) and carbohydrates (325 g) based on a reference caloric intake of 2,350 calories. The agency did not propose a DRV for protein, but it did propose an RDI value of 50 g for protein for adults and children 4 or more years of age. The agency recognizes that clarification may be necessary concerning these values because the caloric value of the DRV's for total fat (675 calories) and total carbohydrates (1,300 calories) when coupled with the caloric value of the RDI for protein (200 calories) do not sum to the reference caloric intake of 2,350 calories.

The dietary recommendations that serve as the basis for the DRV's for total fat and carbohydrate (i.e., 30 percent and 55 percent of calories, respectively (Ref. 3)) result in the assumption that protein intake will furnish the remaining calorie requirements, i.e., protein will comprise approximately 15 percent of calories. The assumption is made by persons developing dietary guidance materials that protein will be used not only to meet protein requirements but also to meet some of the caloric needs. This level of protein intake (15 percent

of calories) is consistent with current U.S. dietary consumption patterns and is not considered to be a level of intake inconsistent with good health (Ref. 3). The RDI for protein, on the other hand, is based on the human requirement for protein and reflects the levels of high quality protein needed to maintain body stores and to support growth and development. Therefore, the RDI for protein does not provide the same level of caloric value as the level of protein intake that is incorporated into dietary pattern recommendations. To clarify this issue, FDA is proposing to add a note to the DRV listing in § 101.9(c)(11)(i), redesignated as § 101.9(c)(12)(i) in this proposal, to state that the caloric contribution of protein is assumed to be approximately 15 percent.

(8) FDA is proposing to amend the regulations by removing current § 101.9(c)(7)(v) (proposed § 101.9(c)(11)(iv) (55 FR 29515)). This section allowed for general claims of significance and nutritional superiority. However, the 1990 amendments suggest a somewhat different approach. Section 403(r)(2)(A)(i) of the act only allows such claims if they use terms defined in regulations, and under section 3(b)(1)(A)(iii) (V) and (VI) of the 1990 amendments, "less" and "high" are among the terms that FDA must define. In light of these facts, FDA will define and provide for the proper use of such terms in a separate **Federal Register** document on nutrient content claims.

(9) FDA proposed changes in current § 101.9 (e)(5) and (e)(6) in its mandatory nutrition labeling proposal to specify the food components that it expects will vary by less than 20 percent from the labeled value, and to specify where reasonable excesses or deficiencies would be allowed in nutrition labeling. To complete this activity, the agency should also have proposed changes in current § 101.9(e)(4) so that the nutrients and food components specified in that paragraph are the same as those for which reasonable excesses are allowed in § 101.9(e)(6). Paragraphs (e)(4) through (e)(6) would then identify the upper and lower boundaries for all nutrients and food components declared in nutrition labeling. Accordingly, FDA is proposing to add total carbohydrate, complex carbohydrate, unsaturated fat, and potassium to § 101.9(e)(4), (e)(4)(i), and (e)(4)(ii), which are redesignated as § 101.9(g)(4), (g)(4)(i), and (g)(4)(ii) in this proposal, to specify the amount of variability allowed. Likewise, total carbohydrate was inadvertently left out of § 101.9(e)(6), and the agency is now proposing to insert it in that paragraph, redesignated as § 101.9(g)(6) in this proposal.

(10) The agency failed to explain its rationale in the mandatory nutrition labeling proposal for rearranging the order of some food components within the nutrition label and to specifically request comment on that order. The rationale was based on comments that FDA had received over time that many consumers were finding it difficult to pick out information on fats in the current nutrition label. The agency determined that there was a potential benefit in ordering the information, at least in part, according to its public health significance. To accomplish this goal, FDA proposed in its mandatory nutrition labeling proposal to rearrange the order of the three sources of energy (i.e., fat, carbohydrate, and protein) in § 101.9(c) to state fat first, followed by carbohydrates and protein. This ordering was selected to support the position of the Department of Health and Human Services, as stated in the forward to the Surgeon General's Report on Nutrition and Health, that "Of highest priority among the (dietary) changes (that can improve the health prospects of many Americans) is to reduce intake of foods high in fats and to increase intake of foods high in complex carbohydrates and fiber" (Ref. 2, p. v.). Subelements of fat and carbohydrates are proposed to be listed immediately under the declaration of each element. Comments are requested on this proposed arrangement.

B. Increments

In addition to the above corrections, FDA is proposing to change the increments for declaring fats and fatty acids. The agency is proposing in § 101.9(c)(4), (c)(4)(i), (c)(4)(ii), (c)(4)(ii)(A), and (c)(4)(ii)(B) to require declaration of total fat, saturated fat, unsaturated fat, polyunsaturated fat, and monounsaturated fat, respectively, in ½ g increments. The agency is proposing this change to increase the consistency between the probable quantitative declaration of a food component and its level of significance. For example, sodium, which has a DRV of 2,400 mg, may be reported to the nearest 10-mg increment when the serving contains more than 140 mg of sodium. This reporting represents a ratio of the increment to the DRV of 10/2400, which is equivalent to 0.4 percent (hereafter the ratio will be reported parenthetically following the percent equivalent). This ratio is similar to that for carbohydrates, which are to be declared to the nearest g and for which the ratio of the increment to the DRV of 325 g is 0.3 percent (1/325). These values differ significantly from the comparable ratios for total fat and fatty acids, which are to be reported to the nearest g. The ratio for total fat with a DRV of 75 g is 1 percent (1/75); for saturated fat with a DRV of 25 g, 4 percent (1/25); and for unsaturated fat with a DRV of 50 g, 2 percent (1/50). DRV s were not proposed for polyunsaturates or monounsaturates, therefore similar calculations cannot be made for them. The ratio of the increment to the DRV for cholesterol (300 mg) is 2 percent (5/300) and of the increment to the RDI for protein (50 g for adults and children over 4 years of age) is 2 percent (1/50).

In reviewing all of these ratios, the ratio for saturated fat is clearly the highest. Requiring ½ g increments for all fatty acids lowers the ratio to 2 percent for saturated fat (0.5/25) and to 1 percent for unsaturated fat (0.5/50). A similar change for total fat that would allow all fat entries to be rounded to the same increment lowers the ratio to 0.7 percent (0.5/75). These ratios are more comparable to those for sodium, carbohydrate, cholesterol, and protein.

The agency believes the proposed change to allow declaration of fat and fatty acids in ½ g increments will provide consumers with more precise information and a greater ability to discriminate among products. It will also make calculation of the number of calories from fat more consistent with the declared amount of fat, because calories are to be reported to the nearest 5-calorie increment up to and including 50 calories. The disadvantages are that, because of natural variability in fat content in some foods, the 0.5 g increment will convey to the consumer a degree of precision that may not be supported by the analytical measurements and thus the degree of reliability of the value for some foods may be decreased. Moreover, where the food matrix complicates fat extraction, the cost of analysis will be higher. The agency therefore requests comment on this proposed change, and whether it would be preferable to maintain 1 g increments for declaring fat and fatty acids.

A similar argument can be made for requiring that dietary fiber (with a ratio of the increment to the DRV of 25 g of 4 percent (1/25)) be declared to the nearest 1/2 g. However, the precision of the analytical methodology for determining quantitative amounts of fiber does not allow for that degree of accuracy. Therefore, FDA is not proposing to change the current procedure of declaring amounts of dietary fiber to the nearest g.

VII. Labeling of Dietary Supplements of Vitamins and Minerals

A. History

The agency has a long history relating to the labeling of dietary supplements. In the **Federal Register** of November 22, 1941 (6 FR 5921), FDA promulgated regulations on food for special dietary uses under 403(j) of the act, which states that a food shall be deemed to be misbranded:

> * * * if it purports to be or is represented for special dietary uses, unless its label bears such information concerning its vitamin, mineral, and other dietary properties as the Secretary determines to be, and by regulations prescribes as, necessary in order fully to inform purchasers as to its value for such uses.

In the **Federal Register** of August 2, 1973 (38 FR 20708 and 20730), FDA adopted new regulations to govern the labeling and composition of dietary supplements and other foods that purport or are represented to be for special dietary use because of vitamin or mineral properties (the 1973 regulations). These regulations were codified in §§ 80.1, 125.1, 125.2, and 125.3 (21 CFR 80.1, 125.1, 125.2, 125.3. They were recodified as §§ 105.3, 105.60, 105.77 and 105.85 (21 CFR 105.3, 105.60, 105.77, and 105.85) as part of the general agency reorganization and republication of its regulations in 1977 (42 FR 14302 at 14328 and 14331, March 15, 1977).

The 1973 regulations set forth definitions, standards of identity, and labeling statements for vitamin and mineral dietary supplements. The standards permitted only five basic types of preparations (a multivitamin supplement, a multimineral supplement, a multivitamin supplement with iron, and a supplement consisting of any single vitamin or mineral); prescribed the vitamin, mineral, and other ingredient composition of multinutrient supplements; and specified maximum and minimum potencies for vitamins and mineral ingredients. These potencies were stated in terms of U.S. RDA's which were derived by FDA from the recommended dietary allowances (RDA's) established by the Food and Nutrition Board of the NAS in 1968 (Ref. 24). In general, the minimum potency for a nutrient in a dietary supplement was established at 50 percent of the U.S. RDA for the nutrient, the maximum potency at 150 percent of the U.S. RDA.

Fifteen petitions for review of this rulemaking were filed in various United States courts of appeals and eventually consolidated in the United States Court of Appeals for the Second Circuit. After extensive briefing and oral argument, the Court on August 15, 1974, held that it was "broadly sustaining the regulations," but it remanded them to the agency for certain further actions (*National Nutritional Foods Association* v. *Food and Drug Administration*, 504 F.2d 761, 786 (2d Cir. 1974).

A petition for certiorari, asking the U.S. Supreme Court to review the decision by the U.S. Court of Appeals for the Second Circuit, was filed, but on February 24, 1975, it was denied (420 U.S. 946). Thereafter, FDA began the process of implementing the remand instructions of the U.S. Court of Appeals. On May 28, 1975, FDA published a preliminary notice in the **Federal Register** (40 FR 23244) (the 1975 proposal) inviting applications for additional formulations of dietary supplements as the court had directed, proposing certain other revisions in the regulations consistent with the court's opinion, and announcing the reopening of the administrative hearing on which the regulations were based.

While FDA was in the process of completing the hearing and revising the vitamin and mineral regulations pursuant to the instructions of the U.S. Court of Appeals, Congress enacted legislation (Pub. L. 94–278, title V, April 22, 1976) that became section 411 of the act (known as "the Proxmire Amendment"). This amendment restricted the agency s authority to limit both the maximum potency of vitamins and minerals in dietary supplements and the ingredient composition of multinutrient supplements that are offered for use by adults (other than pregnant or lactating women). Dietary supplements represented for use by pregnant or lactating women, by children under the age of 12, or by individuals in the treatment or management of specific diseases or disorders were excluded from the Proxmire Amendnent (i.e., the agency retained authority to limit the maximum potency and ingredient composition of these products).

The agency issued a final regulation in the **Federal Register** of October 19, 1976 (41 FR 46156), that amended the 1973 regulations to comply with the court's 1974 remand instructions and with the Proxmire Amendment. The agency received petitions to reconsider the propriety of issuing a final rule without having first issued a proposed rule. FDA denied these petitions on the ground that a proposed rule was unnecessary because the rule merely "recognized the will of Congress."

The petitioners appealed to the U.S. Court of Appeals for the Second Circuit, and the appeals were consolidated. On February 16, 1978, the Second Circuit vacated the regulations and remanded them to the agency for further proceedings (*National Nutritional Foods Association* v. *Kennedy*, 572 F. 2d 377 (2d Cir. 1978)). The court made clear that the agency had to issue proposed regulations, and that the issue for comment was whether the proposed regulations were "suitable in light of what Congress had done." In the **Federal Register** of March 16, 1979 (44 FR 16005), FDA revoked the 1976 regulations and reinstated portions of the 1973 regulations. The agency has not taken any further action on the 1976 regulations.

B. Legal Authority

Section 403(q)(5)(E) of the act states that if a food to which section 411 of the act applies (i.e., dietary supplements of vitamins and minerals) contains one or more of the nutrients required to be listed in nutrition labeling, "the label or labeling of such food shall comply with the requirements of subparagraphs (1) and (2) (of section 403(q) of the act) in a manner which is appropriate for such food and which is specified in regulations of the Secretary."

Currently, dietary supplements, including dietary supplements of vitamins and minerals to which section 411 of the act applies (except for dietary supplements in conventional food form, e.g., breakfast cereals), are exempt from the nutrition labeling regulations (21 CFR 101.9(h)(2)). FDA carried this exemption forward in the mandatory nutrition labeling proposal, redesignated as § 101.9(h)(5) (55 FR 29487 at 29516).

To now comply with the new section 403(q)(5)(E) of the act, the agency is proposing to amend § 101.9(h)(2), now redesignated as § 101.9(j)(5), to provide that dietary supplements of vitamins and minerals (except those in conventional food form) bear appropriate nutrition labeling. FDA is also proposing a new section, § 101.36 entitled "Nutrition labeling of dietary supplements of vitamins and minerals," under Part 101—Food Labeling, Subpart C—Specific Nutrition Labeling Requirements and Guidelines, to establish nutrition labeling regulations that the agency believes are appropriate for dietary supplements of vitamins and minerals.

In accordance with section 403(q)(5)(E) of the act, § 101.36(a) proposes that vitamin and mineral supplements provide nutrition labeling. Vitamin and mineral supplements that do not contain any of the 15 nutrients required to be in nutrition labeling are not required by section 403(q)(5)(E) of the act to bear nutrition labeling. However, the agency believes that these

supplements are required to bear nutrition labeling under section 403(q)(5)(C) of the act. This section provides that nutrition labeling is not required when a food contains insignificant amounts of all of the nutrients required to be listed in nutrition labeling unless a claim is made with respect to the nutritional value of the food. Thus, when such a claim is made, nutrition labeling is required. With respect to dietary supplements of vitamins and minerals, the agency believes that a statement of identity, such as "Vitamin E," on the label of a product is a claim about the nutritional value of the food. Therefore, such products must bear nutrition labeling under the act.

However, the agency is providing in § 101.9(j)(5) that such supplements are to be labeled in accordance with proposed § 101.36. Although the 1990 amendments are silent with respect to whether these products should bear nutrition labeling specific for dietary supplements or for conventional foods, because these products are more similar to those regulated under section 411 of the act than to conventional foods, the agency tentatively finds that it is appropriate that they bear nutrition labeling specific for dietary supplements in accordance with proposed § 101.36. The agency requests comments on this issue.

Under § 101.9(a)(4), dietary supplements to which vitamins and minerals have been added, and that contain 50 percent or more of the RDI of any one of the added vitamins or minerals, are foods for special dietary use to which section 403(j) of the act applies. Therefore, to the extent that the regulations that FDA is proposing apply to foods for special dietary use, FDA is proposing these regulations under section 403(j) of the act as well as section 403(q) of the act.

FDA is not proposing a specific exception for dietary supplements that do not contain vitamins or minerals. Under this proposal, these products are subject to the general provisions set forth in § 101.9(a).

The agency emphasizes that § 101.36 pertains only to the nutrition labeling of dietary supplements of vitamins and minerals. This section does not authorize the use of any particular vitamins or minerals as components of vitamin and mineral supplements. The use of vitamins and minerals in food must be in accordance with the appropriate regulations (i.e., food additive, generally recognized as safe, or prior-sanctioned food ingredient regulations). Dietary supplements of selenium, fluoride, and chromium, for example, are not permitted.

C. Provisions of Proposed Section 101.36

To reduce consumer confusion, the agency is proposing that nutrition labeling of vitamin and mineral supplements appear as similar as possible to the nutrition labeling of other foods.

The agency is proposing in § 101.36(b) to require that the overall heading of the nutrition label be "NUTRITION INFORMATION" rather than "NUTRITION INFORMATION PER SERVING." The agency is not proposing that the term "per serving" be used in the heading for vitamin and mineral supplements because the information presented may be declared per day as well as per unit (or serving). The agency prefers the use of the term "unit" rather than "serving" for supplements because the word "serving" is customarily used to describe conventional foods.

The agency is proposing in § 101.36(b)(1) that the listing of "Units per day" be required for supplements in place of "Serving (portion) size" as required in § 101.9(c)(1) because more than one unit of a supplement is often consumed per day, and it is important that the amount recommended by the manufacturer for consumption over the period of 1 day be clearly stated. Proposed § 101.36(b)(1) allows for the use of terms such as "tablets," "capsules," or "teaspoonsful," to be used in lieu of "units" throughout the nutrition label depending on whether the product is in tablet, capsule, or liquid form (e.g., the nutrition label on a bottle of vitamin tablets could state "Tablets per day"). The agency believes that use of the more precise terms will aid consumer understanding. The quantity specified must be reasonable and suitable for daily dietary consumption and consistent with any intake recommendations on the label or in labeling.

The agency is proposing in § 101.36(b)(2) to require the listing of "Units per container" in lieu of "Servings (portions) per container" as required in § 101.9(c)(2) for conventional foods. Again, the word "units" could be replaced with the appropriate term for the type of product.

The agency is proposing in § 101.36(b)(3) that only those nutrients or food components listed in § 101.9(c) that are present in more than insignificant amounts must be declared in the nutrition label of vitamin and mineral supplements. FDA is not proposing to require that the label of such supplements follow the simplified format described in proposed § 101.9(f) for conventional foods. Conventional foods that contain insignificant amounts of 8 or more of the 15 nutrients and food components required under proposed § 101.9(c) are required to declare 5 elements (i.e., calories, total fat, total carbohydrate, protein, and sodium) even when the amounts declared are zero (proposed § 101.9(f)(3)(i)). However, because vitamin and mineral supplements that are not in conventional food form generally do not contain the five food components required in the simplified format, FDA believes that it would not be confusing or misleading to consumers to omit the required declaration of these elements when they are absent or present in insignificant amounts. Therefore, FDA tentatively concludes it is not necessary to require that these elements be declared on such supplements when they are present in insignificant amounts.

Similarly, proposed § 101.9(f)(4) would require that when amounts of nutrients and food components other than the 15 required nutrients are declared in the simplified nutrition label on conventional foods, the statement "Not a significant source of _____" be included at the bottom of the nutrition label with the blank filled in by whichever of the following are present in insignificant amounts: Calories from total fat, saturated fat, cholesterol, complex carbohydrate, sugars, dietary fiber, vitamin A, vitamin C, calcium, and iron. FDA is not aware of any consumer expectations that these nutrients or food components are present in vitamin or mineral supplements if they are not, in fact, declared on the label. Therefore, the agency does not believe a statement declaring that these components are not present in the supplements in significant amounts is needed. Such a statement could even be confusing to consumers. FDA therefore is not proposing that vitamin and mineral supplements need to include the statement "Not a significant source of _____" as required by proposed § 101.9(f)(4).

FDA believes that what is needed for full consumer understanding of the content of dietary supplements of vitamins and minerals is full declaration of any of the 15 required nutrients as well as any additional vitamins and minerals for which RDI's are proposed that are present in more than insignificant amounts. Accordingly, FDA is proposing in § 101.36(b)(3) that the quantitative amounts of all nutrients and food components that must be included in nutrition labeling in accordance with § 101.9(c) be declared in addition to the percent of the RDI. The agency points out that § 101.9(c)(7)(iii) (redesignated here as

§ 101.9(c)(11)(ii)) requires the declaration within nutrition labeling of all vitamins and minerals that have been added as a nutrient supplement or that are the subject of a claim. Most dietary supplements currently include information on both the quantitative amounts and the percent of the U.S. RDA. The agency believes that continuation of this type of labeling will help to ensure that consumers are fully informed about the content of these products.

FDA also is proposing in § 101.36(b)(3) that the required nutrition information shall be presented in columns under the heading "PER UNIT." If more than one unit is specified for consumption per day, the information shall also be presented in a second set of columns under the heading of "PER DAY." The agency is requiring that nutrition information should be declared by both the unit and daily amounts where label directions suggest consumption of more than one unit per day to more fully inform the consumer.

FDA is proposing in § 101.36(b)(3)(i) that nutrients and food components to be declared in nutrition labeling of vitamin and mineral supplements be listed in the order that the nutrients and food components are listed in nutrition labeling of conventional foods (i.e., as specified in § 101.9(c)) with the exception that calcium and iron shall be listed with the other minerals following the complete list of vitamins present.

Proposed § 101.36(b)(3)(ii) specifies the manner in which the quantitative nutrition information shall be presented. FDA is proposing that the information be given in a column under the heading of "Amount." In addition, the quantitative amounts should be expressed in the increments and units of measure (e.g., mg) specified in proposed § 101.9(c). Although the agency is not requiring that the quantitative amounts of vitamins and minerals be included in nutrition labeling of conventional foods, the agency believes that this additional information is useful on the labels of supplements because these products are represented and sold for their vitamin and mineral content. FDA is proposing that the quantitative amounts of vitamins and minerals should be declared to the nearest unit of measure of the same level of significance as that given in § 101.9(c)(11)(iv) for that nutrient. For example, 2.775 mg of thiamin would be declared as 2.8 mg, whereas 2.775 niacin equivalents (mg NE) of niacin would be declared as 3 mg NE.

Proposed § 101.36(b)(3)(iii) would require that the percent of the RDI specified in § 101.9(c)(11)(iv) be declared for each vitamin and mineral present under the heading "Percent of Daily Value." In section III.C.2. above, the agency requested further comment on the appropriateness of the single term "daily value" on the label to represent both RDI's and DRV's. If the agency is persuaded by comments to specify a different term in § 101.9(c)(11) in the final regulations, the new terminology will also apply to proposed § 101.36(b)(3)(iii). FDA therefore requests comments on the use of the term "Daily Value" in the labeling of dietary supplements as well as conventional foods.

Proposed § 101.36(b)(3)(iii)(A) requires that, unless the supplement is represented or purported to be for adults and children 4 or more years of age, column headings must clearly specify the group for which the RDI values are being declared. This proposed requirement is consistent with the current practice of manufacturers of vitamin and mineral supplements and with regulations governing nutrition labeling of conventional foods. It is based on the reasonable assumption that a product is for use by the general population unless specified to the contrary.

Consistent with the manner in which percent RDI's are reported in nutrition labeling, FDA is proposing in § 101.36(b)(3)(iii)(B) that percent RDI's be expressed in 2 percent increments up to and including the 10-percent level, 5 percent increments above 10 percent and up to and including the 50-percent level, and 10 percent increments above the 50-percent level.

The agency is proposing in § 101.36(b)(3)(iv) that vitamin and mineral supplements intended for use by more than one group for which RDI's have been proposed must list the percent daily value for each group. This proposed requirement is consistent with proposed § 101.9(c)(11)(i) which requires that foods represented or purported to be for use by more than one group for which RDI's exist, state the percent of daily values based on the RDI values for each group separately and in equal prominence.

As discussed previously, the agency has tentatively decided to require that DRV's listed in § 101.9(c)(11)(i) be declared in nutrition labeling of conventional foods. If this requirement appears in the final rule for § 101.9, then dietary supplements of vitamins and minerals will also be required to present this information and the percent of the DRV for fat, saturated fat, cholesterol, carbohydrate, dietary fiber, and sodium provided by the supplement when they are declared (i.e., when they are present in the supplement in more than insignificant amounts). The agency requests comments on the usefulness of this information on the nutrition labeling of dietary supplements of vitamins and minerals.

Consistent with nutrition labeling of conventional foods, FDA is proposing in § 101.36(b)(3)(v) to allow the use of synonyms for certain nutrients. The synonyms to be allowed are "folacin" for "folate," "ascorbic acid" for "vitamin C," and "energy" for "calories." The agency's position on synonyms is spelled out in the mandatory nutrition labeling proposal (55 FR 29487 at 29502).

FDA believes dietary supplements of vitamins and minerals should be subject to the same compliance policies as conventional processed foods and is therefore proposing in § 101.36(c) that compliance shall be determined in accordance with proposed § 101.9(g).

The following hypothetical sample labels illustrate proposed nutrition labeling of dietary supplements of vitamins and minerals:

DAILY VITAMINS PLUS IRON, MULTIPLE VITAMINS PLUS IRON

Nutrition Information

Tablets per day: 1 Tablets per container: 365	Per unit	
	Amount	Percent of daily value
Calories	15	
Total fat	1 g	
Total carbohydrate	1 g	
Sugars	1 g	
Sodium	10 mg	
Vitamin A	875 µg RE	100
Vitamin C	60 mg	100
Vitamin D	6.5 µg	100
Vitamin E	9 mg α-TE	100
Thiamin	1.2 mg	100
Riboflavin	1.4 mg	100
Niacin	16 mg NE	100
Folate	180 µg	100
Vitamin B_{12}	2 µg	100
Pantothenic acid	5.5 mg	100
Iron	12 mg	100

B-VITAMINS—TAKE ONE WITH EACH MEAL

VIII. Other Actions

A. Effective Date

In its July 19, 1990 proposals, FDA proposed to make these regulations effective 1 year after the publication of a final rule. FDA requested comment on this deviation from the agency's normal practice of making food labeling regulations effective on the uniform compliance date that follows publication of the final rule. However, section 10(a)(1)(A) of the 1990 amendments requires that these regulations become effective 6 months after the date of promulgation of all final regulations required to implement section 403(q) of the act, or, if no final regulations have issued by November 8, 1992, this proposal, which incorporates the RDI/DRV and the mandatory nutrition labeling proposals of July 19, 1990, is statutorily mandated to be considered a final rule on November 8, 1992, with an effective date of May 8, 1993. FDA invites comments on this effective date taking into consideration the provisions of section 10 of the act.

FDA notes, however, that in section 10(a)(3)(B) of the 1990 amendments, Congress provides that if the Secretary of Health and Human Services (the Secretary), and by delegation FDA, finds that requiring compliance with section 403(q) of the act, on mandatory nutrition labeling, or with section 403(r)(2) of the act, on nutrient content claims, 6 months after publication of the final rules in the Federal Register would cause undue economic hardship, the Secretary may delay the application of these sections for no more than 1 year. In light of the agency's tentative findings in its regulatory impact analysis that compliance with the 1990 amendments by May 8, 1993, will cost $1.5 billion, and that 6 month and 1 year extensions of that compliance date will result in savings that arguably out weigh the lost benefits, FDA believes that the question of whether it can and should provide for an extension of the effective date of sections 403(q) and (r)(2) of the act is squarely raised.

FDA has carefully studied the language of section 10(a)(3)(B) of the 1990 amendments and sees a number of questions that need to be addressed. The first question is the meaning of "undue economic hardship." FDA recognizes that the costs of compliance with the new law are high, but those costs derive in large measure from the great number of labels and firms involved. The agency questions whether the costs reflected in the aggregate number represent "undue economic hardship." Therefore, FDA requests comments on how it should assess "undue economic hardship." Should it assess this question on a firm-by-firm basis, as was provided in the bill that passed the House Committee on Energy and Commerce (H. Rept. 101–538, 101st Cong., 2d sess., 24 (1990)), an industry-by-industry basis, or should it assess this question on an aggregate basis? If the agency should take the latter approach, comments should provide evidence that would permit the agency to make a determination that there is "undue economic hardship" for most companies. FDA also points out that assessing hardship on a firm-by-firm basis would likely be extremely burdensome because of the likely number of requests.

FDA will consider the question of the meaning and appropriate application of section 10(a)(3)(B) of the 1990 amendments as soon as possible after the comment period closes. The agency intends to publish a notice in advance of any final rule announcing how it will implement this section to assist firms in planning how they will comply with the act. The early publication of this notice is to assist firms in avoiding any unnecessary expenses that could be incurred by trying to comply with a compliance date that may cause "undue economic hardship."

B. Consumer Education Program

Section 2(c) of the 1990 amendments directs the Secretary of the Department of Health and Human Services to carry out a consumer education program related to the nutrition label and its importance in maintaining healthy dietary practices. The agency discussed its intention to undertake such activities in its mandatory nutrition labeling proposal (55 FR 29487 at 29508). This program will require many varied activities, such as identification of key educational needs; target populations; appropriate educational strategies; educational messages; materials development; establishment of a food label education network to include representatives from health professionals and educators, consumers, and the food industry to assist in dissemination and implementation of educational materials and programs; and evaluation of the program's impact. FDA intends to begin to develop and implement these activities as quickly as possible, so that materials will be available to consumers as revised food labels begin appearing in the marketplace.

C. Preemption

In its July 19, 1990 proposal, FDA acknowledged the numerous comments that it received at the public hearings and as a result of its advance notice of proposed rulemaking (54 FR 32610, August 8, 1989) that suggested that Federal nutrition labeling rules should explicitly preempt any State nutrition labeling regulations. Because of the complexity of this issue, however, the agency requested additional comments on the appropriateness of preemption before deciding on a course of action.

Section 6 of the 1990 amendments settled the issue by amending the act to

include several provisions pertaining to Federal preemption of State and local labeling requirements. The 1990 amendments prohibit a State or a political subdivision of a State from establishing or continuing in effect any requirement for food in interstate commerce that would conflict with certain provisions of section 403 of the act. Specifically, section 403A(a)(4) of the act, which was added by the 1990 amendments, prohibits any requirement for nutrition labeling of food that is not identical to the requirement of section 403(q) of the act. The only exceptions provided in this section are for nutrition labeling of foods sold in restaurants, restaurant-type facilities, or ready-to-eat foods sold in retail establishments such as delicatessens that are exempt under section 403(q)(5)(A)(i) or (q)(5)(A)(ii) of the act from Federal nutrition labeling provisions (section 403A(a)(4) of the act).

Congress included the preemption provisions in the 1990 amendments because it recognized that it would be difficult or impossible for food companies to operate in interstate commerce if they were confronted with State and local requirements that were in conflict with, or were inconsistent with, the applicable Federal requirements (Ref. 25). However, Congress also recognized that Federal preemption should only apply in matters where a strong Federal regulatory system is in place (Ref. 25). Congress recognized a role for the States, permitting them to petition the Secretary for exemption from the preemption provisions in situations where a State requirement does not conflict with Federal law, does not burden interstate commerce, and addresses a need that is not met by the provisions of the act that have preemptive effect (section 403A(b) of the act).

The preemption provision concerning nutrition labeling of foods established under section 403(q) of the act becomes effective upon the effective date of the proposed regulations (section 10(b)(1)(D) of the 1990 amendments). Accordingly, the proposed revisions in § 101.9 that address nutrition labeling will preempt any State or local requirement to the contrary when these revisions become effective.

D. Redesignation

In the July 19, 1990 proposal, FDA did not republish existing § 101.9(i), which pertains to the circumstances in which labeling relating to the nutritional properties of a product can misbrand it. The agency had planned to revise this section as part of its rulemaking on health claims (see the **Federal Register** of February 13, 1990 (55 FR 5176)). However, in light of the 1990 amendments, FDA believes that it is appropriate to retain this paragraph and to deal with health claims in a separate section of the regulations. However, FDA believes that § 101.9(k)(1) is so closely related to the health claims issue that it is appropriate to discuss that provision in the proposal on health claims. Consequently, FDA is retaining paragraph (i) and redesignating it as paragraph (k) to reflect the other provisions of this proposal. However, FDA is reserving § 101.9(k)(1) and reproposing that provision in the companion document.

IX. Economic Impact

The food labeling reform initiative, taken as a whole, will have associated costs in excess of the $100 million threshold that defines a major rule. Therefore, in accordance with Executive Order 12291 and the Regulatory Flexibility Act (Pub. L. 96–354), FDA has developed one comprehensive regulatory impact analysis (RIA) that presents the costs and benefits of all of the food labeling provisions taken together. The RIA is published elsewhere in this issue of the **Federal Register**. The agency requests comments on the RIA.

X. Environmental Impact

The agency has previously considered the environmental effect of this rule as announced in the July 19, 1990, mandatory nutrition labeling proposal (55 FR 29487). No new information or comments have been received, nor have there been any changes effected by the 1990 amendments, that would affect the agency's previous determination that there is no significant impact on the human environment and that an environmental impact statement is not required.

XI. Comments

Interested persons may, on or before February 25, 1992, submit to the Dockets Management Branch (address above) written comments regarding this proposal. Two copies of any comments are to be submitted, except that individuals may submit one copy. Comments are to be identified with the docket number found in brackets in the heading of this document. Received comments may be seen in the office above between 9 a.m. to 4 p.m., Monday through Friday.

In accordance with section 2(b)(1) of the 1990 amendments, FDA must issue by November 8, 1992, final regulations for mandatory nutrition labeling. If the agency does not promulgate final regulations by November 8, 1992, the 1990 amendments provide that the regulations proposed in this document shall be considered as the final regulations. The agency has determined that 90 days is the maximum time that it can provide for the submission of comments and still meet this statutory timeframe for the issuance of final regulations. Thus, the agency is advising that it will not consider any requests under 21 CFR 10.40(b) for extension of the comment period beyond February 25, 1992. The agency must limit the comment period to no more than 90 days to assure sufficient time to develop a final rule based on this proposal and the comments it receives.

List of Subjects in 21 CFR Part 101

Food labeling, Reporting and recordkeeping requirements.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, it proposed that 21 CFR Part 101 be amended as follows:

PART 101—FOOD LABELING

1. The authority citation for 21 CFR Part 101 continues to read as follows:

Authority: Secs. 4, 5, 6 of the Fair Packaging and Labeling Act (15 U.S.C. 1453, 1454, 1455); secs. 201, 301, 402, 403, 409, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 331, 342, 343, 348, 371).

2. Section 101.9 is revised to read as follows:

§ 101.9 Nutrition labeling of food.

(a) Nutrition information relating to food shall be provided for all products that contain more than insignificant amounts of nutrients or food components required in paragraph (c) of this section, or whose label, labeling, or advertising contains a nutrition claim or any other nutrition information, in conformity with the requirements of this section unless an exemption is provided for the product in paragraph (j) of this section. An insignificant amount of a nutrient or a food component shall be that amount that allows a declaration of zero in nutrition labeling. A nutrition claim or any other nutrition information in any context, and in any form of expression, implicit, as well as explicit, shall subject a food to the provisions of this section.

(1) When food is in package form, the required nutrition labeling information shall appear on the label in the format specified in this section.

(2) When food is not in package form, the required nutrition labeling information shall be displayed clearly at the point of purchase (e.g., on a counter card, sign, tag affixed to the product, or some other appropriate device). Alternatively, the required information may be placed in a booklet, looseleaf binder, or other appropriate format that is available at the point of purchase.

(3) Solicitation of requests for nutrition information by a statement "For nutrition information write to _____" on the label or in the labeling or advertising for a food, or providing such information in a direct written reply to a solicited or unsolicited request, does not subject the label or the labeling of a food exempted under paragraph (j) of this section to the requirements of this section if the reply to the request conforms to the requirements of this section.

(4) If any vitamin or mineral is added to a food so that a single serving provides 50 percent or more of the Reference Daily Intake (RDI) for the age group for which the product is intended, as specified in paragraph (c)(11)(iv) of this section, of any one of the added vitamins or minerals, unless such addition is permitted or required in other regulations, e.g., a standard of identity or nutritional quality guideline, or is otherwise exempted by the Commissioner, the food shall be considered a food for special dietary use within the meaning of § 105.3(a)(1)(iii) of this chapter.

(b) [Reserved]

(c) The declaration of nutrition information on the label and in labeling shall contain the following information except for that which is voluntary as set forth in this paragraph or for those food products where a simplified format shall be used as provided for in paragraph (f) of this section. Information shall be presented in the following order, using the headings specified and displayed with equal type size, under the overall heading of "NUTRITION INFORMATION PER SERVING (PORTION)." Alternatively, the terms "PER SERVING (PORTION)" may be placed directly below the terms "NUTRITION INFORMATION."

(1) "Serving (portion) size": A statement of the serving (portion) size.

(2) "Servings (portions) per container": The number of servings (portions) per container.

(3) "Caloric content" or "Calories": A statement of the caloric content per serving (portion), expressed to the nearest 5-calorie increment up to and including 50 calories, and 10-calorie increment above 50 calories, except that

amounts less than 5 calories may be expressed as zero. Energy content per serving (portion) may also be expressed in kilojoule units, added in parentheses immediately following the statement of the caloric content. Caloric content may be calculated by using specific Atwater food factors or by using the general factors of 4, 4, and 9 calories per gram for protein, carbohydrate, and fat, respectively, as described in A. L. Merrill and B. K. Watt, "Energy Value of Foods—Basis and Derivation," USDA Handbook 74 (1955). The definition of carbohydrate is given in paragraph (c)(6) of this section. These methods of calculation are incorporated by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies of the references are available from the Division of Nutrition, Center for Food Safety and Applied Nutrition (HFF–260), Food and Drug Administration, 200 C St. SW., Washington, DC 20204, or available for inspection at the Office of the Federal Register, 1100 L St. NW., Washington, DC.

(i) "Calories from total fat": A statement of the caloric content derived from the total fat content of the food per serving (portion), expressed to the nearest 5–calorie increment, up to and including 50 calories, and the nearest 10–calorie increment above 50 calories, except that label declaration of "calories from total fat" is not required on products that contain less than ½ gram of fat in a serving (portion) and amounts less than 5 calories may be expressed as zero. This statement shall be indented under the statement of calories, or, alternatively, calories from fat may be declared adjacent to the statement of fat content and aligned with the statement of total calories, in a column headed "Calories." Except as provided for in paragraph (f) of this section, if "Calories from total fat" is not required and, as a result, not declared, the statement "Not a significant source of calories from total fat" shall directly follow the declaration of sodium (or potassium if declared) in the same type size.

(ii) "Calories from saturated fat," "Calories from unsaturated fat," "Calories from carbohydrate," and "Calories from protein" (VOLUNTARY): A statement of the caloric content derived from a serving (portion) of any one or more of the following components may be declared voluntarily: Saturated fat, unsaturated fat, total carbohydrate, and protein. Caloric values shall be expressed to the nearest 5–calorie increment, up to and including 50 calories, and the nearest 10–calorie increment above 50 calories, except that amounts less than 5 calories may be expressed as zero.

(A) "Calories from saturated fat" or "Calories from saturated": A statement of the caloric content derived from saturated fat as defined in paragraph (c)(4)(i) of this section. This statement shall be indented under the statement of calories from total fat, or alternatively the calories from saturated fat may be declared adjacent to the statement of saturated fat content.

(B) "Calories from unsaturated fat" or "Calories from unsaturated": A statement of the caloric content derived from unsaturated fat as defined in paragraph (c)(4)(ii) of this section. This statement shall be indented under the statement of calories from total fat, and follow calories from saturated fat, if present; or alternatively calories from unsaturated fat may be declared adjacent to the statement of unsaturated fat content.

(C) "Calories from total carbohydrate": A statement of the caloric content derived from total carbohydrate as calculated in paragraph (c)(6) of this section. This statement shall be indented under the statement of calories from total fat, and follow calories from saturated fat and unsaturated fat, if present; or alternatively calories from total carbohydrate may be declared adjacent to the statement of carbohydrate content and aligned with the statement of total calories, in a column headed "Calories."

(D) "Calories from protein": A statement of the caloric content derived from protein as calculated in paragraph (c)(8) of this section. This statement shall be indented under the statement of calories from total fat, and follow calories from saturated fat, unsaturated fat, and total carbohydrate, if present; or alternatively calories from protein maybe declared adjacent to the statement of protein content and aligned with the statement of total calories, in a column headed "Calories."

(4) "Total fat content" or "Total fat": A statement of the number of grams of total fat in a serving (portion) expressed to the nearest ½ gram. If the serving (portion) contains less than 0.5 gram, the content shall be expressed as zero.

(i) "Saturated fat content," "Saturated fat," or "Saturated": A statement of the number of grams of saturated fat in a serving (portion) calculated as triglycerides and defined as the sum of lauric, myristic, palmitic, and stearic acids, except that label declaration of saturated fat content information is not required for products that contain less than 1/2 gram of total fat in a serving if no claims are made about fat or cholesterol content, and if "calories from saturated fat" is not declared. Except as provided for in paragraph (f) of this section, if a statement of the saturated fat content is not required and, as a result, not declared, the statement "Not a significant source of saturated fat" shall directly follow the declaration of sodium (or potassium if declared) in the same type size. Saturated fat content shall be indented and expressed as grams per serving (portion) to the nearest 1/2 gram. If the serving (portion) contains less than 0.25 gram, the content shall be expressed as zero.

(ii) "Unsaturated fat content," "Unsaturated fatty acid," or "Unsaturated (VOLUNTARY): A statement of the number of grams of unsaturated fat in a serving (portion) calculated as triglycerides and defined as the sum of all polyunsaturated and monounsaturated fatty acids (both *cis* and *trans* isomers) may be declared voluntarily, except that when a claim is made on the label or in labeling about fatty acid or cholesterol content or when "calories for unsaturated fat" is declared, label declaration shall be required. Unsaturated fat content shall be indented and expressed as grams per serving (portion) to the nearest ½ gram. If the serving (portion) contains less than 0.25 gram, the content shall be expressed as zero. Alternatively, separate statements may be declared for polyunsaturated and monounsaturated fat, except that if a claim is made on the label or in labeling about a particular type of unsaturated fatty acid, separate statements shall be declared as follows in lieu of the collective term "Unsaturated":

(A) "Polyunsaturated fat" or "Polyunsaturated": A statement of the number of grams of polyunsaturated fat defined as *cis,cis*-methylene-interrupted polyunsaturated fatty acids, indented and expressed as grams per serving to the nearest 1/2 gram. If the serving (portion) contains less than 0.25 gram, the content shall be expressed as zero; and

(B) "Monounsaturated fat" or "Monounsaturated": A statement of the number of grams of monounsaturated fat defined as *cis*-monounsaturated fatty acids, indented and expressed as grams per serving to the nearest ½ gram. If the serving (portion) contains less than 0.25 gram, the content shall be expressed as zero.

(5) "Cholesterol content" or "Cholesterol": A statement of the cholesterol content in a serving (portion) expressed in milligrams to the nearest 5–milligram increment, except that label declaration of cholesterol information is

not required for products that contain less than 2 milligrams cholesterol in a serving (portion) and make no claim about fat, fatty acids, or cholesterol content, or such products may state the cholesterol content as zero. Except as provided for in paragraph (f) of this section, if cholesterol content is not required and, as a result, not declared, the statement "Not a significant source of cholesterol" shall directly follow the declaration of sodium (or potassium if declared) in the same type size. If the food contains 2 to 5 milligrams of cholesterol per serving (portion), the content may be stated as "less than 5 milligrams."

(6) "Total carbohydrate content" or "Total carbohydrate": A statement of the number of grams of total digestible carbohydrate in a serving (portion) expressed to the nearest gram, except that if a serving (portion) contains less than 1 gram, the statement "Contains less then 1 gram" or "less than 1 gram" may be used as an alternative, or if the serving (portion) contains less then 0.5 gram, the content may be expressed as zero. Total carbohydrate content shall be calculated by subtraction of the sum of the crude protein, total fat, dietary fiber, moisture, and ash from the total weight of the food. (This calculation method is described in A.L. Merrill and B.K. Watt, "Energy Value of Foods—Basis and Derivation," USDA Handbook 74 (1955) which is incorporated by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51 except that total dietary fiber as described in paragraph (c)(7)(ii) of this section shall also be subtracted). Copies of the method may be obtained from the Division of Nutrition, Center for Food Safety and Applied Nutrition (HFF–260), Food and Drug Administration, 200 C St. SW., Washington, DC 20204, or available for inspection at the Office of the Federal Register, 1100 L St. NW., Washington, DC.

(i) "Complex carbohydrate content" or "Complex carbohydrate": A statement of the number of grams of digestible complex carbohydrate, defined as the sum of dextrins (saccharide units of 10 or more) and starches, except that label declaration of complex carbohydrate content is not required for products that contain less than 1 gram of complex carbohydrate in a serving. Except as provided for in paragraph (f) of this section, if a statement of the complex carbohydrates content is not required and, as a result, not declared, the statement "Not a significant source of complex carbohydrate" shall directly follow the declaration of sodium (or potassium if declared) in the same type size. Complex carbohydrate content shall be indented and expressed to the nearest gram, except that if a serving (portion) contains less than 1 gram, the statement "Contains less than 1 gram" or "less than 1 gram" may be used as an alternative, and if the serving (portion) contains less than 0.5 gram, the content may be expressed as zero.

(ii)(A) "Sugars content" or "Sugars": A statement of the number of grams of sugars in a serving (portion), except that label declaration of sugars content is not required for products that contain less than 1 gram of sugars in a serving if no claims are made about sweeteners, sugars, or sugar alcohol content. Except as provided for in paragraph (f) of this section, if a statement of the sugars content is not required and, as a result, not declared, the statement "Not a significant source of sugars" shall directly follow the declaration of sodium (or potassium if declared) in the same type size. Sugars shall be defined as the sum of all free mono- and oligosaccharides through four saccharide units (such as glucose, fructose, lactose, sucrose, and glucose polymers up to four saccharide units) and their derivatives whose use in the food is approved by the Food and Drug Administration or is generally recognized as safe that have similar sweetening, nutritional, and metabolic effects (such as sugar alcohols). Sugars content shall be indented and expressed to the nearest gram, except that if a serving (portion) contains less than 1 gram, the statement "Contains less then 1 gram" or "less than 1 gram" may be used as an alternative, and if the serving (portion) contains less than 0.5 gram, the content may be expressed as zero.

(B) "Sugar alcohol content" or "Sugar alcohol" (VOLUNTARY): A statement of the number of grams of sugar alcohols in a serving (portion) may be declared voluntarily on the label, except that when a claim is made on the label or in labeling about sugar alcohol or sugars when sugar alcohols are present in the food, sugar alcohol content shall be declared. For nutrition labeling purposes, sugar alcohols are defined as the sum of mannitol, sorbitol, xylitol, and any other sugar alcohols whose use in the food is approved by FDA or is generally recognized as safe and that meet the definition of sugars as described in paragraph (c)(6)(ii)(A) of this section. Sugar alcohol content shall be indented under sugars content and expressed to the nearest gram, except that if a serving (portion) contains less than 1 gram, the statement "Contains less then 1 gram" or "less than 1 gram" may be used as an alternative, and if the serving (portion) contains less than 0.5 gram, the content may be expressed as zero.

(7) "Dietary fiber content" or "Dietary fiber": A statement of the number of grams of total dietary fiber in a serving (portion), expressed to the nearest gram, except that if a serving (portion) contains less than 1 gram, declaration of dietary fiber is not required or, alternatively, the statement "Contains less than 1 gram" or less than 1 gram" may be used, and if the serving (portion) contains less than 0.5 gram, the content may be expressed as zero. Except as provided for in paragraph (f) of this section, if dietary fiber content is not required and as a result, not declared, the statement "Not a significant source of dietary fiber" shall directly follow the declaration of sodium (or potassium if declared) in the same type size.

(i) Soluble and insoluble fiber (VOLUNTARY): A statement of the number of grams of soluble and insoluble dietary fiber in a serving (portion) may be declared voluntarily except that when a claim is made on the label or in labeling about either type of fiber, label declaration of both types shall be required as follows:

(A) "Soluble fiber": A statement of the number of grams of soluble dietary fiber, indented and expressed to the nearest gram, except that if a serving (portion) contains less than 1 gram, the statement "Contains less than 1 gram" or "less than 1 gram" may be used as an alternative, and if the serving (portion) contains less than 0.5 gram, the content may be expressed as zero, and

(B) "Insoluble fiber": A statement of the number of grams of insoluble dietary fiber, indented and expressed to the nearest gram except that if a serving (portion) contains less than 1 gram, the statement "Contains less than 1 gram" or "less than 1 gram" may be used as an alternative, and if the serving (portion) contains less than 0.5 gram, the content may be expressed as zero.

(ii) Total dietary fiber, soluble dietary fiber, and insoluble dietary fiber content shall be determined by the method "Total Dietary Fiber in Foods, Enzymatic Gravimetric Method, First Action," in the *Journal of the Association of Official Analytical Chemists* (JAOAC), 68:399, 1985, as amended in JAOAC, 69:370 1986 and as modified in JAOAC 71:1017, 1988. These nethods are incorporated by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies are available from the Division of Nutrition, Center for Food Safety and Applied Nutrition (HFF–260), Food and Drug Administration, 200 C St. SW.,

Washington, DC 20204, or available for inspection at the Office of the Federal Register, 1100 L St. NW., Washington, DC.

(8) "Protein content" or "Protein": A statement of the number of grams of protein in a serving (portion), expressed to the nearest gram, except that if a serving (portion) contains less than 1 gram, the statement "Contains less than 1 gram" or "less than 1 gram" may be used as an alternative, and if the serving (portion) contains less than 0.5 gram, the content may be expressed as zero. When the protein in foods represented or purported to be for adults and children 4 or more years of age has a protein quality value that is a protein digestibility-corrected amino acid score of less than 20 expressed as a percent, the protein content statement shall be modified by an adjacent statement "not a significant source of protein" regardless of the actual amount of protein present. The same statement is required when the protein quality in a food as measured by the protein digestibility-corrected amino acid score is less than 40 percent of the reference standard (casein) for a food represented or purported to be for children greater than 1 but less than 4 years of age; or when the protein quality in a food as measured by Protein Efficiency Ratio (PER) is less than 40 percent of the reference standard (casein) for a food represented or purported to be for infants. Protein content may be calculated on the basis of the factor of 6.25 times the nitrogen content of the food as determined by the appropriate method of analysis as given in the current edition of the Official Methods of Analysis of the Association of Official Analytical Chemists, which is incorporated by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51, except when the official procedure for a specific food requires another factor. Copies may be obtained from the Association of Official Analytical Chemists, 2200 Wilson Blvd., suite 400, Arlington, VA 22201-3301, or may be examined at the Office of the Federal Register, 1100 L St. NW., Washington, DC.

(i) A statement of the corrected amount of protein per serving, as determined in paragraph (c)(8)(ii) of this section, calculated as a percentage of the RDI for protein and expressed as "Percent of Daily Value," may be placed on the label, except that such a statement shall be given if a protein claim is made for the product, or if the product is represented or purported to be for use by infants or children under 4 years of age. When such a declaration is provided, it shall be placed on the label adjacent to the statement of grams of protein. However, the percentage of the RDI for protein shall not be declared if the food is represented or purported to be for use by adults and children 4 or more years of age and the protein quality value is a protein digestibility-corrected amino acid score of less than 20 expressed as a percent, or if the food is represented or purported to be for use by infants or children under 4 years of age and the protein quality value is less than 40 percent of the reference standard.

(ii) The "corrected amount of protein (gram) per serving (portion)" for foods represented or purported for adults and children 1 or more years of age is equal to the actual amount of protein (gram) per serving (portion) multiplied by the amino acid score corrected for protein digestibility. If the corrected score is above 1.00 then it shall be set at 1.00. The protein digestibility-corrected amino acid score shall be determined by the method given in "Protein Quality Evaluation," Report of the Joint FAO/WHO Expert Consultation on Protein Quality Evaluation, Rome, 1990, which is incorporated by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies are available from the Division of Nutrition, Center for Food Safety and Applied Nutrition (HFF-260), Food and Drug Administration, 200 C St. SW., Washington, DC 20204, or available for inspection at the Office of the Federal Register, 1100 L St. NW., Washington, DC. For foods represented or purported for infants, the corrected amount of protein (grams) per serving is equal to the actual amount of protein (grams) per serving (portion) multiplied by the relative protein quality value. The relative protein quality value shall be determined by dividing the subject food protein PER value by the PER value for casein. If the relative protein value is above 1.00, it shall be set at 1.00.

(iii) For the purpose of labeling with a percent of the RDI, a value of 50 grams of protein shall be the RDI for adults and children 4 or more years of age, 16 grams of protein for children less than 4 years of age, and 14 grams of protein for infants.

(9) "Sodium content" or "Sodium": A statement of the number of milligrams of sodium in a specified serving (portion) of food expressed as zero when the serving (portion) contains less than 5 milligrams of sodium, to the nearest 5-milligram increment when the serving (portion) contains 5 to 140 milligrams of sodium, and to the nearest 10-milligram increment when the serving (portion) contains greater than 140 milligrams.

(10) "Potassium content" or "potassium" (VOLUNTARY): A statement of the number of milligrams of potassium in a specified serving (portion) of food may be declared voluntarily, except that when a claim is made about potassium content, label declaration shall be required. Potassium content shall be expressed as zero when the serving (portion) contains less than 5 milligrams of potassium, to the nearest 5-milligram increment when the serving (portion) contains less than or equal to 140 milligrams of potassium, and to the nearest 10-milligram increment when the serving (portion) contains more than 140 milligrams.

(11) Under the heading "Percent of Daily Value": A statement of the amount per serving (portion) of the vitamins and minerals as described in this paragraph, expressed as a percent of the RDI.

(i) For purposes of declaration of Percent of Daily Value, foods represented or purported to be for use by infants, children less than 4 years of age, pregnant women, or lactating women shall use the RDI's in paragraph (c)(11)(iv) of this section that are specified for the intended group. For foods represented or purported to be for use by both infants and children under 4 years of age, the Percent of Daily Value shall be presented by separate declarations based on the RDI values for infants from birth to 12 months of age and for children under 4 years of age. Similarly, the Percent of Daily Value based on both the RDI values for pregnant women and for lactating women shall be declared separately on foods represented or purported to be for use by both pregnant and lactating women. When such dual declaration is used on any label, it shall also be included in all labeling, and equal prominence shall be given to both values in all such labeling. All other foods shall use the RDI for adults and children 4 or more years of age.

(ii) The declaration of vitamins and minerals as a percent of the RDI shall include vitamin A, vitamin C, calcium, and iron, in that order, and shall include any of the other vitamins and minerals listed in paragraph (c)(11)(iv) of this section when they are added as a nutrient supplement, or when a claim is made about them. The declaration may also include any of the other vitamins and minerals listed in paragraph (c)(11)(iv) of this section when they are naturally occurring in the food. The additional vitamins and minerals shall be listed in the order established in paragraph (c)(11)(iv) of this section.

(iii) The percentages hall be expressed in 2-percent increments up to

and including the 10–percent level, 5–percent increments above 10 percent and up to and including the 50–percent level, and 10–percent increments above the 50–percent level. Vitamins and minerals present in amounts less than 2 percent of the RDI are not required to be declared in nutrition labeling but may be declared by a zero or by the use of an asterisk that refers to another asterisk that is placed at the bottom of the table and that is followed by the statement "Contains less than 2 percent of the Daily Value of this (these) nutrient (nutrients)." Except as provided for in paragraph (f) of this section, if vitamin A, vitamin C, calcium, or iron is omitted, the statement "Not a significant source of _____ (listing the vitamins or minerals omitted)" shall directly follow the listing of percentages of the RDI.

(iv) The following RDI's and nomenclature are established for the following vitamins and minerals which are essential in human nutrition:

Nutrient	Unit of measurement [1]	Adults and children 4 or more years of age	Children less than 4 years of age [2]	Infants [3]	Pregnant women	Lactating women
Vitamin A	Retinol equivalents [4]	875	400	375	800	1,300
Vitmin C	Milligrams	60	40	33	70	95
Calcium	do	900	800	500	1,200	1,200
Iron	do	12	10	8.0	30	15
Vitamin D	Micrograms [5]	6.5	10	9.0	10	10
Vitamin E	α-Tocopherol equivalents [4]	9.0	6.0	3.5	10	12
Vitamin K	Micrograms	65	15	7.5	65	65
Thiamin	Milligrams	1.2	0.7	0.4	1.5	1.6
Riboflavin	do	1.4	0.8	0.5	1.6	1.8
Niacin	Niacin equivalents [4]	16	9.0	5.5	17	20
Vitamin B_6	Milligrams	1.5	1.0	0.5	2.2	2.1
Folate	Micrograms	180	50	30	400	280
Vitamin B_{12}	do	2.0	0.7	0.4	2.2	2.6
Biotin	do	60	20	13	65	65
Pantothenic acid	Milligrams	5.5	3.0	2.5	5.5	5.5
Phosphorus	do	900	800	400	1,200	1,200
Magnesium	do	300	80	50	320	355
Zinc	do	13	10	5.0	15	19
Iodine	Micrograms	150	70	45	175	200
Selenium	do	55	20	13	65	75
Copper	Milligrams	2.0	0.9	0.6	2.5	2.5
Manganese	do	3.5	1.3	0.6	3.5	3.5
Fluoride	do	2.5	1.0	0.5	3.0	3.0
Chromium	Micrograms	120	50	33	130	130
Molybdenum	do	150	38	26	160	160
Chloride	Milligrams	3,150	1,000	650	3,400	3,400

[1] The following abbreviations are allowed: "mg" for "milligrams"; "mcg" or "μg" for "micrograms"; "μg RE" for "retinol equivalents"; "mg α-TE" for "α-tocopherol equivalents"; "mg NE" for "niacin equivalents."
[2] The term "children less than 4 years of age" means persons 13 through 47 months of age.
[3] The term "infants" means persons not more than 12 months of age.
[4] 1 retinol equivalent = 1 microgram retinol or 6 micrograms β-carotene; 1 α-tocopherol equivalent = 1 milligram *d*-α-tocopherol; 1 niacin equivalent = 1 milligram niacin or 60 milligrams of dietary tryptophan.
[5] As cholecalciferol.

(v) The following synonyms may be added in parentheses immediately following the name of the nutrient or dietary component:

Vitamin C	Ascorbic acid
Folate	Folacin
Calories	Energy

(12) Under the heading "Nutrition Profile": A statement of the percent of the Daily Reference Value (DRV) present in a serving (portion) for food components for which DRV's are given in paragraph (c)(12)(i) of this section shall be declared, followed by a statement of the DRV for each component. The percent and DRV shall be declared for total fat, saturated fat, cholesterol, total carbohydrate, dietary fiber, and sodium. Unsaturated fat and potassium also may be included. The percents of DRV's shall be expressed in 2-percent increments up to and including the 10-percent level, 5-percent increments above 10 percent and up to and including the 50-percent level, and 10-percent increments above the 50-percent level.

(i) The following DRV's are established for the following food components based on a reference caloric intake of 2,350 calories (**Note:** The caloric contribution from protein is assumed to be approximately 15 percent.):

Food component	Unit of measurement [1]	DRV
Total fat	grams	75
Saturated fat	do	25
Unsaturated fat	do	50
Cholesterol	milligrams	300
Total carbohydrate.	grams	325
Dietary fiber	do	25
Sodium	milligrams	2,400
Potassium	do	3,500

[1] The following abbreviations are allowed: "g" for "grams" and "mg" for "milligrams."

(ii) The following format shall be used to present a food product's nutrition profile:

Food component	Percent	Daily value
Total fat	(percent)	75 grams. [1]
Saturated fat	(percent)	25 grams. [1]
Cholesterol	(percent)	300 milligrams.
Total carbohydrate	(percent)	325 grams. [1]
Dietary fiber	(percent)	25 grams. [1]
Sodium	(percent)	2,400 milligrams.

[1] As part of a 2,350 calorie diet.

(iii) In addition, the percent of the DRV for unsaturated fat may be listed in the Nutrition Profile immediately following saturated fat and the percent

of the DRV for potassium immediately following sodium as follows:

Unsaturated fat	(percent)	50 grams.*
Potassium	(percent)	3,500 milligrams.

(d) [Reserved]

(e) Products with separately packaged ingredients, with assortments of food, or to which other ingredients are added by the user may be labeled as follows:

(1) If a product consists of two or more separately packaged ingredients enclosed in an outer container or of assortments of food (e.g., assorted candy mixtures) in the same package, nutrition labeling of the total product shall be located on the outer container to provide information for the consumer at the point of purchase. However, when two or more food products are simply combined together in such a manner that no outer container is used, or no outer label is available, each product shall have its own nutrition information, e.g., two boxes taped together or two cans combined in a clear plastic overwrap.

(2) If a food is commonly combined with other ingredients or is cooked or otherwise prepared before eating, and directions for such combination or preparations are provided, another column of figures may be used to declare the nutrient contents on the basis of the food as consumed in the same format required in paragraph (c) of this section for the food alone (e.g., a dry ready-to-eat cereal may be described with one set of Daily Values for the cereal as sold (e.g., per ounce), and another set for the cereal and milk as suggested in the label (e.g., per ounce of cereal and 1/2 cup of vitamin D fortified whole milk); and a cake mix may be labeled with one set of Daily Values for the dry mix (per serving) and another set for the serving of the final cake when prepared): *Provided*, That, the type and quantity of the other ingredients to be added to the product by the user and the specific method of cooking and other preparation shall be specified prominently on the label.

(f)(1) The declaration of nutrition information shall be presented in the simplified format set forth herein when a food product contains insignificant amounts of eight or more of the following: calories, calories from total fat, total fat, saturated fat, cholesterol, total carbohydrate, complex carbohydrate, sugars, dietary fiber, protein, sodium, vitamin A, vitamin C, calcium, and iron.

(2) An "insignificant amount" shall be defined as that amount that may be rounded to zero in nutrition labeling.

(3) The simplified format shall include:

(i) Serving size, number of servings per container, calories, total fat (grams), total carbohydrate (grams), protein (grams), and sodium (milligrams);

(ii) Any other nutrients or food components identified in paragraph (f)(1) of this section that are present in the food in more than insignificant amounts; and

(iii) Any other vitamins and minerals listed in paragraph (c)(11)(iv) of this section when they are required to be added as a nutrient supplement to foods for which a standard of identity exists.

(4) Other nutrients or food components that are present in the food in more than insignificant amounts may be voluntarily declared as part of the simplified format. Any vitamins or minerals that are added to the food as nutrient supplements shall be declared as part of the simplified format. If additional nutrients or food components are declared as part of the simplified format for either of these reasons, the statement "Not a significant source of _____" (with the blank filled in with the name of any nutrient or food component identified in § 101.9(f)(1) present in insignificant amounts) shall be included at the bottom of the nutrition label.

(5) Nutrient information in the simplified format may be presented in vertical columns or in lines. When lines are used, any subcomponents declared shall be listed parenthetically after principal components (e.g., saturated fat shall be parenthetically listed after total fat).

(g) Compliance with this section shall be determined as follows:

(1) A collection of primary containers or units of the same size, type, and style produced under conditions as nearly uniform as possible, designated by a common container code or marking, or in the absence of any common container code or marking, a day's production, constitutes a "lot".

(2) The sample for nutrient analysis shall consist of a composite of 12 subsamples (consumer units), taken 1 from each of 12 different randomly chosen shipping cases, to be representative of a lot. Unless a particular method of analysis is specified in paragraph (c) of this section, composites shall be analyzed by appropriate methods as given in the 15th edition 1990 of the Official Methods of Analysis of the Association of Official Analytical Chemists (AOAC) which is incorporated by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51 or, if no AOAC method is available or appropriate, by other reliable and appropriate analytical procedures. Copies of the incorporation by reference are available from the Association of Official Analytical Chemists, 2200 Wilson Blvd., suite 400, Arlington, VA 22201–3301, or available for inspection at the Office of the Federal Register, 1100 L St. NW., Washington, DC. Alternative methods of analysis may be submitted to FDA to determine their acceptability.

(3) Two classes of nutrients are defined for purposes of compliance:

(i) Class I. Added nutrients in fortified or fabricated foods; and

(ii) Class II. Naturally occurring (indigenous) nutrients. If any ingredient which contains a naturally occurring (indigenous) nutrient is added to a food, the total amount of such nutrient in the final food product is subject to Class II requirements unless the same nutrient is also added.

(4) A food with a label declaration of a vitamin, mineral, protein, total carbohydrate, complex carbohydrate, dietary fiber, unsaturated fat, or potassium shall be deemed to be misbranded under section 403(a) of the Federal Food, Drug, and Cosmetic Act (the act) unless it meets the following requirements:

(i) *Class I vitamin, mineral, protein, total carbohydrate, complex carbohydrate, dietary fiber, unsaturated fat, or potassium.* The nutrient content of the composite is at least equal to the value for that nutrient declared on the label.

(ii) *Class II vitamin, mineral, protein, total carbohydrate, complex carbohydrate, dietary fiber, unsaturated fat, or potassium.* The nutrient content of the composite is at least equal to 80 percent of the value for that nutrient declared on the label. *Provided*, That no regulatory action will be based on a determination of a nutrient value which falls below this level by a factor less than the variability generally recognized for the analytical method used in that food at the level involved.

(5) A food with a label declaration of calories, sugars, total fat, saturated fat, cholesterol, or sodium shall be deemed to be misbranded under section 403(a) of the act if the nutrient content of the composite is greater than 20 percent in excess of the value for that nutrient declared on the label.

(6) Reasonable excesses of a vitamin, mineral, protein, total carbohydrate, complex carbohydrate, dietary fiber, unsaturated fat, or potassium over labeled amounts are acceptable within current good manufacturing practice.

Reasonable deficiencies of calories, sugars, total fat, saturated fat, cholesterol, or sodium under labeled amounts are acceptable within current good manufacturing practice.

(7) The compliance provisions set forth in paragraphs (g)(1) through (g)(6) of this section do not apply to products for which nutrition labeling is founded on FDA approved data bases and is computed following FDA guideline procedures and that have been handled in accordance with current good manufacturing practice to prevent nutrition loss. FDA approval of a data base shall not be considered granted until the Center for Food Safety and Applied Nutrition has agreed to all aspects of the data base in writing. The approval will be granted where a clear need is presented (e.g., raw produce and seafood). Approvals will be in effect for a limited time, e.g., 10 years, and will be eligible for renewal in the absence of significant changes in agricultural or industry practices. Approval requests shall be submitted in accordance with the provisions of § 10.30 of this chapter. Guidance in the use of data bases may be found in the "FDA Nutrition Labeling Manual—A Guide for Using Data Bases," available from the Division of Nutrition, Center for Food Safety and Applied Nutrition (HFF–260), Food and Drug Administration, 200 C St. SW., Washington, DC 20204.

(8) When it is not technologically feasible, or some other circumstance makes it impracticable, for firms to develop adequate nutrient profiles to comply with the requirements of paragraph (c) of this section, FDA may establish by regulation alternative means of compliance or additional exemptions to deal with the situation. Firms in need of such a regulation may submit a petition for initiation of rulemaking proceedings to the Dockets Management Branch in the form established by § 10.30 of this chapter.

(h) Nutrition information provided by a manufacturer or distributor directly to professionals (e.g., physicians, dietitians, educators) may vary from the requirements of this section but shall also contain or have attached to it the nutrition information exactly as required by this section.

(i) The location of nutrition information on a label shall be in compliance with § 101.2.

(j) The following foods are exempt from this section or are subject to special labeling requirements:

(1)(i) Food offered for sale by a person who has annual gross sales made or business done in sales to consumers which is not more than $500,000 or has annual gross sales made or business done in sales of food to consumers of not more than $50,000, *Provided,* That the food bears no nutrition claims or information on a label or labeling or in advertising.

(ii) For purposes of this paragraph, a person who offers food for sale, or who has business done in sales, to consumers is any person who manufactures, packs, or distributes food for ultimate sale to consumers at the retail level as well as any person directly involved in the retail sale of foods to consumers.

(iii) For purposes of this paragraph, calculation of the amount of sales shall be based on the most recent 2-year average of business activity. Where firms have been in business less than 2 years, reasonable estimates must indicate that annual sales will not exceed the amounts specified. For foreign firms that ship foods into the United States, the business activities to be included shall be the total amount of food sales, as well as other sales to consumers, by the firm in the United States.

(2) Food products provided by restaurants or other food service facilities offering restaurant-type services (e.g., delicatessens, bakeries, feeding facilities in organizations such as schools, colleges, hospitals, and transportation carriers (such as trains and airplanes)). Foods sold to restaurants by distributors who principally sell food to restaurants or other establishments in which food is served for immediate human consumption, and who do not manufacture, process, or repackage the food they sell.

(3) Food products provided by grocery stores that are offered for sale from:

(i) Self-service food bars (e.g., salad bars); or

(ii) Behind delicatessen or bakery counters.

(4) Foods, other than infant formula, represented or purported to be specifically for infants and toddlers less than 2 years of age shall bear nutrition labeling, except that such labeling shall not include calories from fat or saturated fat and cholesterol content information.

(5) Dietary supplements of vitamins and minerals that are labeled in compliance with § 101.36, except that the labeling of a dietary supplement of vitamins and minerals in food form, e.g., a breakfast cereal, shall conform to the labeling established in paragraph (c) of this section, including the order for listing vitamins and minerals established in paragraph (c)(11)(iv) of this section.

(6) Infant formula subject to section 412 of the act, as amended, except that such foods shall be labeling in compliance with part 107 of this chapter.

(7) Medical foods as defined in section 5(b) of the Orphan Drug Act (21 U.S.C. 360ee(b)(3)). A medical food is a food which is formulated to be consumed or administered enterally under the supervision of a physician and which is intended for the specific dietary management of a disease or condition for which distinctive nutritional requirements, based on recognized scientific principles, are established by medical evaluation. A food is subject to this exemption only if:

(i) It is a specially formulated and processed product (as opposed to a naturally occurring foodstuff used in its natural state) for the partial or exclusive feeding of a patient by means of oral intake or enteral feeding by tube;

(ii) It is intended for the dietary management of a patient who, because of therapeutic or chronic medical needs, has limited or impaired capacity to ingest, digest, absorb, or metabolize ordinary foodstuffs or certain nutrients, or who has other special medically determined nutrient requirements, the dietary management of which cannot be achieved by the modification of the normal diet alone;

(iii) It provides nutritional support specifically modified for the management of the unique nutrient needs that result from the specific disease or condition, as determined by medical evaluation;

(iv) It is intended to be used under medical supervision; and

(v) It is provided only to a patient receiving active and ongoing medical supervision wherein the patient seeks medical care on a recurring basis for, among other things instructions on the use of the medical food.

(8) Food products shipped in bulk form that are not for distribution to consumers in such form and that are to be processed, labeled, or repacked at a site other than where originally processed or packed.

(9) Food products that are supplied for institutional food service use only: *Provided,* That the manufacturer or distributor provides the nutrition information required by this section directly to those institutions on a current basis.

(10) Raw fruits, vegetables, and fish subject to section 403(q)(4) of the act, except that such foods should adhere to guidelines in § 101.45. The term "fish" includes freshwater or marine fin fish, crustaceans, and mollusks, including

shellfish, amphibians, and other forms of aquatic animal life.

(11) Foods in small packages that have a total surface area available to bear labeling of less than 12 square inches, *Provided,* That the labels for these foods bear no nutrition information. Nutrition labeling for foods that qualify for this exemption shall be presented to consumers in accordance with the provisions of paragraph (a)(2) of this section.

(12) Shell eggs packaged in a carton that has a top lid designed to conform to the shape of the eggs are exempt from outer carton label requirements where the required nutrition information is clearly presented in no less than 1/16 inch type size immediately beneath the carton lid.

(13) The unit containers in a multiunit retail food package where:

(i) The multiunit retail food package labeling contains all nutrition information in accordance with the requirements of this section;

(ii) The unit containers are securely enclosed within and not intended to be separated from the retail package under conditions of retail sale; and

(iii) Each unit container is labeled with the statement "This Unit Not Labeled For Retail Sale" in type size not less than 1/16 inch in height. The word "individual" may be used in lieu of or immediately preceding the word "Retail" in the statement.

(14) Food products sold from bulk containers: *Provided,* That nutrition information required by this section be displayed to consumers either on the labeling of the bulk container plainly in view or in accordance with the provisions of paragraph (a)(2) of this section.

(k) A food labeled under the provisions of this section shall be deemed to be misbranded under sections 201(n) and 403(a) of the act if its labeling represents, suggests, or implies:

(1) [Reserved]

(2) That a balanced diet of ordinary foods cannot supply adequate amounts of nutrients.

(3) That the lack of optimum nutritive quality of a food, by reason of the soil on which that food was grown, is or may be responsible for an inadequacy or deficiency in the quality of the daily diet.

(4) That the storage, transportation, processing, or cooking of a food is or may be responsible for an inadequacy or deficiency in the quality of the daily diet.

(5) That the food has dietary properties when such properties are of no significant value or need in human nutrition. Ingredients or products such as rutin, other bioflavonoids, para-amino-benzoic acid, inositol, and similar substances which have in the past been represented as having nutritional properties but which have not been shown to be essential in human nutrition may not be combined with vitamins and/or minerals, added to food labeled in accordance with this section, or otherwise used or represented in any way which states or implies nutritional benefit. Ingredients or products of this type may be marketed as individual products or mixtures thereof: *Provided,* That the possibility of nutritional, dietary, or therapeutic value is not stated or implied, e.g., their labeling does not state that their usefulness in human nutrition has not been established and does not otherwise disclaim nutritional, dietary, or therapeutic value.

(6) That a natural vitamin in a food is superior to an added or synthetic vitamin, or to differentiate in any way between vitamins naturally present from those added.

3. Section 101.36 is added to subpart C to read as follows:

§ 101.36 Nutrition labeling of dietary supplements of vitamins and minerals.

(a) The label and labeling of a dietary supplement of a vitamin or mineral that is listed in § 101.9(c)(11)(iv), other than one in conventional food form (i.e., breakfast cereals), shall bear nutrition labeling in accordance with this regulation.

(b) The declaration of nutrition information on the label and in labeling shall contain the following information, using the headings specified, and displayed with equal type size, under the overall heading of "NUTRITION INFORMATION."

(1) "Units per day": A statement of the number of units to be consumed per day. The quantity specified shall be a reasonable quantity suitable for and practicably of consumption within 1 day and shall be consistent with any intake recommendation on the label or in labeling. Appropriate terms, such as tablets, capsules, or teaspoonfuls, may be used here and elsewhere on the label in place of the term "units".

(2) "Units per container": The number of units per container.

(3) A listing of the quantitative amount and percent of the Reference Daily Intake (RDI), where appropriate, of all nutrients and food components required in § 101.9(c), including any vitamin and mineral listed in § 101.9(c)(11)(iv) present in the supplement, in a column under the heading of "PER UNIT" except that nutrients and food components that are present in the total number of units specified for consumption per day at insignificant amounts need not be declared. Insignificant amounts shall be defined as amounts that allow a declaration of zero in nutrition labeling as specified in § 101.9(c). Where label directions specify that more than one unit be consumed during a period of 1 day, the required nutrition information shall also be presented in a second column under the heading of "PER DAY."

(i) Nutrients and food components shall be listed in the order specified in § 101.9(c) except that calcium and iron, when present, shall follow the complete listing of vitamins.

(ii) The quantitative amounts of all nutrients and food components declared shall be presented in a column under the heading of "Amount." These amounts shall be expressed in the increments and units of measurement specified in § 101.9(c). Quantitative amounts of vitamins and minerals shall be expressed to the nearest unit of the same level of significance given in § 101.9(c)(11)(iv).

(iii) The percent of the RDI specified in § 101.9(c)(11)(iv) of all vitamins and minerals present shall be presented in a column immediately under the heading "Percent of Daily Value." This column shall be to the right of the column of quantitative amounts.

(A) Values shall be based on the percent of the RDI for adults and children 4 or more years of age unless the product is represented or purported to be for use by infants, children less than 4 years of age, pregnant women, or lactating women in which case the column heading shall clearly state the intended group.

(B) The percentages of RDI's shall be expressed in 2 percent increments up to and including the 10-percent level, 5 percent increments above 10 percent and up to and including the 50-percent level, and 10 percent increments above the 50-percent level.

(iv) If the product is for persons within more than one group for which RDI's are established in § 101.9(c)(11)(iv), the percent of daily value for each group shall be presented in additional columns.

(v) The following synonyms may be added in parenthesis immediately following the name of the nutrient or dietary component:

Vitamin C	Ascorbic Acid
Folate	Folacin
Calories	Energy

(c) Compliance with this section shall be determined in accordance with § 101.9(g).

Dated: August 2, 1991.
David A. Kessler,
Commissioner of Food and Drugs.
Louis W. Sullivan,
Secretary of Health and Human Services.

[Docket No. 90N-0165]

RIN 0905-AD08

Food Labeling; Serving Sizes

AGENCY: Food and Drug Administration, HHS.

ACTION: Proposed rule.

SUMMARY: The Food and Drug Administration (FDA) is issuing this document as a reproposal of its proposed regulation entitled "Food Labeling; Serving Sizes" (55 FR 29517, July 19, 1990) in response to the recent enactment of the Nutrition Labeling and Education Act of 1990. The agency also is responding to public comments submitted in response to the July 19, 1990 serving sizes proposal and to the public meeting held on April 4, 1991, on serving sizes (56 FR 8084, February 26, 1991). FDA is proposing to: (1) Define serving and portion size on the basis of the amount of food customarily consumed per eating occasion; (2) establish reference amounts customarily consumed per eating occasion (reference amounts) for 131 food product categories; (3) provide criteria for determining label serving size from the reference amounts; (4) require the use of both common household and metric measures to declare serving size; (5) permit the declaration of serving (portion) size in U.S. measures; (6) permit the optional declaration of nutrient content per 100 grams (g), 100 milliliters (mL), 1 ounce (oz), or 1 fluid ounce (fl oz); (7) define a "single-serving container;" and (8) require that the use of claims such as "low sodium" be based on both the serving size declared on the label and the reference amount.

DATES: Written comments by February 25, 1992. The agency is proposing that any final rule that may issue based upon this proposal become effective 6 months following its publication in accordance with requirements of the Nutrition Labeling and Education Act of 1990.

ADDRESSES: Written comments to the Dockets Management Branch (HFA-305), Food and Drug Administration, rm. 1-23, 12420 Parklawn Dr., Rockville, MD 20857, 301-443-1751.

FOR FURTHER INFORMATION CONTACT: Youngmee K. Park, Center for Food Safety and Applied Nutrition (HFF-265), Food and Drug Administration, 200 C St. SW., Washington, DC 20204, 202-485-0089.

SUPPLEMENTARY INFORMATION:

I. Background

In the Federal Register of July 19, 1990 (55 FR 29487), FDA published a proposed rule entitled "Food Labeling; Mandatory Status of Nutrition Labeling and Nutrient Content Revision" to amend its food labeling regulations to require nutrition labeling on most food products that are meaningful sources of nutrients. In the same issue of the Federal Register (55 FR 29517), FDA published a technical supporting proposal entitled "Food Labeling; Serving Sizes" (hereinafter referred to as the 1990 proposal).

The 1990 proposal stated that in view of the many comments that the agency had received stating the need for more realistic and consistent serving sizes, FDA had concluded that reasonable and standardized serving sizes should be established. The agency proposed to amend the nutrition labeling regulations to: (1) Define serving and portion size on the basis of the amount of food commonly consumed per eating occasion by persons 4 years of age or older, by infants, or by children under 4 years of age (toddlers); (2) require the use of both U.S. (oz, fl oz) and metric measures to declare serving size; (3) permit the declaration of serving (portion) size in familiar household measures; (4) permit the optional declaration of nutrient content per 100 g or 100 mL; (5) define "single-serving containers" as those that contain 150 percent or less of the standard serving size for the food product; and (6) establish standard serving sizes for 159 food product categories to ensure reasonable and uniform serving sizes upon which consumers can make nutrition comparisons among food products. Interested persons were given until November 16, 1990, to submit comments to the agency on the serving size proposal.

On September 26, 1990, the National Academy of Sciences' Institute of Medicine (IOM) issued a report entitled "Nutrition Labeling, Issues and Directions for the 1990s" (hereinafter referred to as the IOM Report) (Ref. 1). The IOM report was written under contract to the Public Health Service, U.S. Department of Health and Human Services (DHHS) and the Food Safety and Inspection Service, U.S. Department of Agriculture (USDA). On October 5, 1990, FDA published a notice in the Federal Register (55 FR 40944), announcing the availability of the IOM report and requesting that interested persons comment on the implications of the report for the agency's July 19, 1990, proposals on food labeling. The report makes several recommendations related to serving sizes.

On November 8, 1990, the President signed into law the Nutrition Labeling and Education Act of 1990 (hereinafter referred to as the "1990 amendments") (Pub. L. 101-535). The 1990 amendments add section 403(q) to the Federal Food, Drug, and Cosmetic Act (the act). Section 403(q) of the act specifies, in part, that:

> * * * the serving size * * * is an amount customarily consumed and which is expressed in a common household measure that is appropriate to the food, or * * * if the use of the food is not typically expressed in a serving size, the common household unit of measure that expresses the serving size of the food.

The 1990 amendments also require, in section 2(b)(1)(B), that FDA adopt regulations that: "* * * establish standards * * * to define serving size or other unit of measure for food, * * *."

While the requirements of the 1990 amendments that pertain to serving sizes are similar in many respects to FDA's 1990 proposal, differences do exist, and questions about the exact meaning and the implementation of these provisions have been raised.

On February 26, 1991 (56 FR 8084), FDA announced a public meeting to discuss issues related to how serving and portion size should be determined and presented as part of nutrition labeling. The notice stated that several issues arising from the comments on the serving size proposal and two other recent developments (the 1990 amendments and the IOM report) required further public comment. Therefore, FDA held a public meeting on serving sizes on April 4, 1991, to provide an opportunity to submit oral comments, as well as an opportunity for written comments, on the issues identified in the notice.

The notice of the public meeting outlined five major issues for discussion at the meeting: (1) Whether, in determining serving (portion) sizes (hereinafter referred to as "serving size" for simplicity) based on the amount of food customarily consumed, the agency should limit itself to national food consumption data, or whether there is other information that should be considered; (2) whether in declaring

serving sizes, weight units in addition to household measures should be required, and how the definition of "household measures" should be standardized; (3) whether deviation from the standard serving size should be allowed if standard serving sizes are required by regulations, and if so, how much deviation should be allowed; (4) whether, in addition to nutrient content per serving, the nutrition label should allow (or require) a column that lists nutrient content on a uniform weight (or volume) basis, such as per 100 g and 100 mL or per oz and fluid oz; and (5) how single-serving containers should be defined, and whether compliance with definitions for adjectival descriptors such as "low sodium" on single-serving containers should be based on the standard serving size or the entire content of a single-serving container. In the announcement, the agency solicited written comments on a sixth, essentially legal, issue involving questions of statutory construction: whether FDA should establish standard serving sizes for specific categories of foods or develop criteria for food manufacturers to use in determining their own serving sizes.

II. Rationale for Reproposal of Serving Sizes Regulation

FDA has carefully considered the serving size provisions of the 1990 amendments and the comments that it received in response to the **Federal Register** documents on serving sizes. As a result, the agency has decided to repropose the serving size regulation for two major reasons. First, FDA wishes to take advantage of the explicit legal authority to regulate the serving sizes used on the nutrition label that is provided by the 1990 amendments. Secondly, the agency has decided to make a number of changes in response to the comments received on the **Federal Register** documents and the public meeting on serving sizes and to explain its reasons for agreeing or not agreeing with the comments.

To implement the 1990 amendments, FDA is proposing to adopt regulations that provide standards for defining serving sizes. There are two basic elements to these proposed standards: (1) Reference amounts of food that are customarily consumed per eating occasion (reference amounts) for 131 product categories; and (2) procedures for determining serving sizes for use on product labels from the reference amounts. While the reference amounts are defined primarily in metric units, under the act, the serving size must be expressed in a common household measure that is appropriate to the particular food.

This reproposal also responds to many requests for changes in other aspects of the 1990 proposal. After careful consideration of all comments, the agency has tentatively concluded that it is desirable to make changes that include:

(1) Revising the definition for single-serving containers to increase the upper limit from "150 percent or less" to "less than 200 percent; and

(2) Revising the basis for evaluating label claims like "low sodium" to include both the declared serving size and the reference amount.

III. Evaluation of IOM Report and Review of Comments

A. FDA's Evaluation of the IOM Report

The agency has carefully reviewed recommendations related to serving size contained in the IOM report. The IOM recommended the continued use of serving size to present nutrition information, the expression of serving sizes in common household measures followed by weight in g in parentheses, and the establishment of a process for manufacturers to petition for deviations from the standard serving size or to create a new subclass of foods with its own serving size. This reproposal adopts these recommendations.

The IOM report also recommended that FDA and USDA jointly establish serving sizes for a limited (few) number of different food categories for ready product comparisons and reference purposes. In response to the IOM report recommendations, FDA established an interagency committee that included representatives of the Food Safety and Inspection Service and the Human Nutrition Information Service of the United States Department of Agriculture (USDA), as well as FDA members. This committee developed general principles and rules used to determine the reference amounts. The committee reviewed data on the amount of food customarily consumed per eating occasion and other information on serving sizes provided by FDA, e.g., serving sizes recommended in dietary guidance materials, serving sizes recommended in comments, serving sizes currently in use, and serving sizes used in Canada. On the basis of these considerations, the committee developed the product categories and the reference amounts listed in § 101.12(b). Interagency cooperation will continue during the development of the final regulation on serving sizes.

In addition, the IOM report recommended that research be conducted to determine consumers' comprehension of food labeling information and their interpretation of serving sizes declared on the food label. FDA has conducted both consumer focus groups and formal consumer research on the format of nutrition labeling, including consumer use and understanding of serving sizes. FDA will propose a label format regulation that reflects the results in the near future.

The IOM report made a few other recommendations that FDA is not proposing to adopt. The IOM report recommended that the quantities specified by dietary guidance recommendations serve as "the main criteria for selecting the amount of food to be described as a serving." FDA did not adopt this recommendation for several reasons:

1. Section 403(q)(1)(A)(i) of the act defines serving size as "an amount customarily *consumed*" (emphasis added). Thus, the act links serving size to the amount consumed and not to an amount recommended by the dietary guidance recommendations or any other system.

2. There is no single set of dietary guidance serving sizes, and, as seen in Table 7–1 of the IOM report (Ref. 1, pp. 206 and 207), the serving size for the same product may differ in accordance with the objectives and goals of the particular guidance.

3. Many serving sizes that do exist in dietary guidance recommendations are for very narrow food categories, e.g., for a specific type of cake, cookie, or cracker, or for a particular fruit or vegetable. Under the act, however, serving sizes have broad application.

4. There are no dietary guidance recommendations for many product categories, particularly processed packaged products for which nutrition labeling is mandatory (e.g., frozen entrees and dinners; snack foods; pickles; sweets; condiments; foods used as ingredients such as dessert toppings/fillings, sauces, and flour; and infant and toddler foods) (Ref. 2). However, in developing the reference amounts, FDA did consider serving sizes recommended in various dietary guidance materials (Refs. 3 through 8), including those identified in the IOM report.

The IOM report recommended establishing serving sizes for a limited number of broad food categories (e.g., fruit juices, breads, cereals, fruits, vegetables, spreads, and salad dressings). FDA does not believe that such broad categories are adequate to implement section 403(q)(1)(A)(i) of the act. This section defines serving size as an amount customarily consumed. The

amount customarily consumed varies widely among foods within the large categories recommended by the IOM. For example, the customarily consumed amount of fruit varies from 1.5 oz for dried fruits to 10 oz for watermelon. Therefore, to implement the act, FDA believes that many more than the limited number of the broad categories recommended by the IOM are necessary. In developing the references amounts, however, FDA took product comparability into consideration to promote nutritional comparison of similar products.

The IOM report also recommended that the number of servings per container be rounded down to the nearest whole number. FDA did not adopt this recommendation because it would introduce an unacceptably large error, as high as 45 percent (2.9 rounded down to 2), for the number of servings per container declared on the label. Instead, FDA is proposing to round to the nearest whole number which will limit the error to about 20 percent or less (2.4 rounded down to 2).

B. Summary of Comments

FDA has reviewed the written comments received on the serving size proposal, the written comments to the notice of public meeting on serving sizes, and the presentations at the public meeting.

FDA received about 370 comments on the serving size proposal. Approximately 39 percent were from domestic and foreign food industries and trade organizations; about 36 percent were from consumers and consumer organizations; about 17 percent were from health professionals, health and other professional organizations, and academia; and 8 percent were from domestic and foreign governments. Industry generally expressed reservations about some parts of the proposal and discussed technical issues, which were infrequently discussed by the other sectors (e.g., serving sizes for their specific products). Consumers, consumer organizations, and health professionals overwhelmingly expressed the need for FDA to regulate serving sizes and generally supported the provisions in the proposal. Comments from the international sources understandably focused on the international harmonization of food labeling (e.g., recommended the use of 100 g (or mL) as the basis for the nutrition information).

In response to the agency s request for comment on implications of the IOM report, only four from industry addressed issues related to serving sizes. Two comments favored serving sizes based on dietary guidance materials; one supported the use of serving sizes expressed in common household measures; and the other opposed FDA establishing serving sizes and proposed that the agency set criteria.

Thirty-one oral presentations were made at the April 4, 1991 public meeting on serving sizes, including 26 (about 85 percent) by representatives of food industries and trade organizations; three were by professional nutrition organizations; and two were by consumer organizations. A written transcript of the meeting is on file with Dockets Management Branch (address above). FDA also received about 80 written comments in response to the public meeting notice, primarily from the food industry and trade organizations but also from nutrition and consumer organizations, government agencies, and a few consumers. Industry comments generally were against FDA establishing specific serving sizes. These comments interpreted the 1990 amendments as requiring FDA to establish standards for serving sizes. Health professionals and consumers, on the other hand, continued to support FDA establishing specific serving sizes for product categories. Most comments also addressed the issue of the basis for determining serving sizes. Industry and health professionals favored considering additional information (e.g., "longstanding" industry serving sizes and dietary guidance recommendations) to food consumption data. Consumer organizations favored using only food consumption data. Comments from all sectors generally agreed that serving size should be expressed in common household units.

The agency will describe the comments on serving sizes in more detail and respond to them in the discussion of the reproposed regulation that follows.

IV. The Reproposed Regulation

A. Introduction

In the 1990 proposal, FDA proposed to retain the current requirement that nutrition information in the labeling of food be declared in relation to a serving or, where the food is customarily not consumed directly, in relation to a portion of the food. The 1990 amendments require that nutrition information be presented on a per serving basis. Therefore, § 101.9(b) of this reproposal codifies this requirement.

In the 1990 proposal, FDA identified five options for regulating serving sizes: (1) Permit manufacturers to establish their own serving sizes; (2) permit manufacturers to develop their own serving sizes by applying criteria established by FDA; (3) FDA adopt a single, uniform serving size (e.g., 100 g or 100 mL); (4) FDA develop standard serving sizes with a petition process to provide a mechanism to add or amend the established serving sizes; and (5) permit manufacturers to use dual declaration of nutrition information on the basis of both standard serving sizes developed by FDA and a uniform 100 g or 100 mL. FDA, choosing the fourth option, proposed to establish standard serving sizes with a petition process for adding to or amending them.

Of those commenting on the five options, a large majority agreed with FDA's approach. Virtually all comments from consumers, health professionals, and State government agencies stated that standard serving sizes are essential and generally supported FDA's proposal. Most food industry comments, however, supported the alternative options of maintaining the current system of allowing manufacturers to develop their own serving sizes or allowing manufacturers to develop their own serving sizes using criteria developed by FDA.

The 1990 amendments (section 2(b)(1)(B)) direct FDA to establish standards to define serving sizes. None of the regulatory options in the 1990 proposal except, the fourth option, the one chosen by FDA, fulfills this legal requirement. Therefore the alternative options are not valid under the 1990 amendments.

To implement this requirement of the 1990 amendments, in this reproposal FDA is proposing to establish regulations under which manufacturers will define the serving sizes that are most appropriate for their products by using the reference amounts and procedures for determining label serving sizes adopted by FDA. To comply with the act with respect to serving size, FDA developed the reference amounts to represent the amount customarily consumed of 131 different types of food, covering virtually everything in the food supply that is regulated by FDA. FDA believes that it is appropriate for it to develop these reference amounts that

provide the basis for serving sizes because the amount of food customarily consumed generally reflects the type of food involved and not who manufactured it. Thus, there is no reason why this amount should vary from manufacturer to manufacturer. Under this proposal, however, manufacturers will convert the reference amount into serving sizes in the common household units that are most appropriate and meaningful for their specific products using the conversion provisions of § 101.9(b)(2).

Several comments objected to FDA determining serving sizes. A trade association expressed concern that government-imposed serving sizes raise flexibility problems for the food industry without providing real benefit to consumers. The association stated that where foods in a category vary in richness and flavor, it is better to let the manufacturer select the serving size than to declare an artificially uniform serving size.

The agency does not agree that consumers will not benefit from a system that would ensure uniformity in serving sizes declared by different manufacturers. Consumers have repeatedly stated the need for uniform serving sizes, and that they perceive a benefit to themselves from FDA establishing standard serving sizes. According to consumers, uniform serving sizes will, among other things, allow them to make comparisons among similar products.

One company commented that the serving size upon which the nutrition information is based should be specific or "appropriate" to the product within the package and objected to establishing a uniform serving size for all products within a category.

FDA agrees that a serving size should be appropriate for the individual product. However, it does not agree that each individual product should have its own serving size. The agency believes that by grouping foods that have similar dietary usage into one category, as was done for the 1990 proposal, a reasonable and appropriate serving size for all foods within that category can be established. As stated above, a consistent serving size for similar products enables consumers to compare the nutritional value of foods that are used interchangeably in the diet.

Several food industry comments stated that FDA developed the 1990 proposal with no input from industry. One company suggested negotiated rulemaking on serving sizes to reach a consensus.

Given the conflicting views in the comments on the proposal, FDA decided that it would be helpful to receive further input before reproposing the serving size regulation. In part because of the time constraints imposed by the 1990 amendments, however, negotiated rulemaking was not a practical option. Instead, FDA decided to hold a public meeting on April 4, 1991, to provide an opportunity for all interested parties, including industry, to present their views and supporting data on various serving size issues. Although a general consensus was not achieved on the several issues that were discussed, this meeting provided the agency with valuable additional information that it used in formulating this reproposal. In addition, at the request of the food industry, FDA has met with many individual companies to discuss serving sizes (Refs. 9 through 16).

Moreover, the agency recognizes that, in certain circumstances, negotiated rulemaking may be a useful tool in developing new or amended reference amounts. Therefore, FDA is providing in proposed § 101.12(h)(14) that, as part of a petition to establish or amend a reference amount, the petitioner shall include information about the feasibility of negotiated rulemaking.

Some comments expressed the need for research on consumers' understanding and use of serving size.

FDA agrees that additional consumer research could be useful in developing the final regulation. The agency has conducted both consumer focus groups and formal consumer research on the format of the nutrition label, including consumer use and understanding of serving sizes. As mentioned earlier, FDA will propose a label format regulation that reflects these research results in the near future. The agency also solicits data on consumers understanding and use of serving sizes.

B. Definition of Serving Size

In § 101.9(b)(1) of the 1990 proposal, FDA proposed to define "serving" or "serving size" to mean the amount of food commonly consumed per eating occasion. Section 403(q)(1)(A)(i) of the act defines serving size as an amount of food "*customarily* consumed" (emphasis added). FDA interprets "an amount customarily consumed" to mean "an amount commonly consumed." Webster dictionaries define "customarily" as "usually," and, in turn, define "usual" as "common." The Webster's New Dictionary of Synonyms and Roget's International Thesaurus list "common" as a synonym for "customary." Thus, FDA's interpretation of "an amount customarily consumed" to mean "an amount commonly consumed" is consistent with the meaning of the word "customarily," as defined in standard authoritative dictionaries and thesauri.

However, to make the definition consistent with the one in the act, in § 101.9(b)(1), FDA is proposing to replace the term "commonly" in the 1990 proposed definition with the term "customarily" and to add a requirement for the expression of serving size in a common household measure. Thus, FDA has revised proposed § 101.9(b)(1) to state: "The term 'serving' or 'serving size' means an amount of food *customarily* consumed per eating occasion by persons 4 years of age or older *which is expressed in a common household measure that is appropriate to the food.*" When the article purports or is represented to be for infants or for toddlers, a "serving or serving size means an amount of food *customarily* consumed per eating occasion by infants up to 12 months of age or by children 1 through 3 years of age." (The underlined portion differs from the definition in the 1990 proposal.)

In § 101.9(b)(1) of the 1990 proposal, FDA proposed to define "portion" to mean "an amount of a food customarily used only as an ingredient in the preparation of other foods." This definition is consistent with the description in the act. Therefore, FDA is retaining the definition of "portion" in § 101.9(b)(1) of this reproposal but modifying it slightly to fit the language of the act. The modified definition reads "* * * The term 'portion' means an amount of a food that is not typically expressed in a serving size, i.e., a food customarily used only as an ingredient in the preparation of other foods (e.g., ¼ cup flour or ¼ cup tomato sauce)."

C. Definition of Single-Serving Container

In § 101.9(b)(2) of the 1990 proposal, FDA proposed to define a single-serving container as a container containing 150 percent or less of the standard serving size and to require that the entire content of the package be labeled as one serving. The agency proposed this definition on the basis of an informal survey that it conducted in the Washington, DC area and FDA's Food Labeling and Package Survey (Ref. 17). These surveys suggested that the 150 percent upper limit on single-serving containers would cover almost all packages whose contents are likely to be consumed at a single-eating occasion.

About two-thirds of the comments on the 1990 proposal supported FDA's definition. Several comments recommended a different cutoff level for single-serving containers however. Some comments stated that the upper

limit should be lowered, e.g., to 125 percent, while another comment suggested increasing the upper limit to 200 percent of the standard serving size. A few comments recommended a range such as 75 to 125 or 50 to 150 percent of the standard serving. The IOM report (Ref. 1) also recommended a range of 50 to 150 percent of the commonly consumed unit.

The agency has learned from its own observations in the marketplace and through comments and presentations at the public meeting on serving sizes, that single-serving packages and containers that are larger than 150 percent of the proposed standard serving sizes are not uncommon on the market and may be increasing in number. One company, for example, pointed out that single-serve buffet cans of canned fruits with pop-tops, which contain 200 percent of the proposed standard serving size, are relatively new on the market but are already extremely popular. Presenters at the public hearing also pointed to additional products intended for consumption at a single-eating occasion that exceed 150 percent of the proposed standard serving sizes, e.g., king-size candy bars. The agency is unable to predict the extent to which these types of larger single-serving products may become available but notes that an increasing number of foods are packaged for convenience to individuals in snacking and in eating away from home.

Because many single-serving packages exceed the proposed 150 percent level, the agency believes that it is not appropriate to lower the cutoff level for the definition of a single-serving container. Rather, in light of the evidence of the trend to larger packages, the agency believes that it is more appropriate to increase the upper limit to "less than 200 percent." This higher level, if adopted, will require that more small packages be labeled as a single-serving.

The agency is proposing to set the upper limit at "less than 200 percent" of the reference amount for two reasons. First, products that contain 200 percent of the reference amount are, by definition, 2 servings. Thus, they are not single servings. Second, there is a significant question as to whether these larger size products will usually be consumed at a single-eating occasion by one individual, considering that the customarily consumed amount is one-half or less than the package container. Thus, the agency believes that it would not be accurate to require that packages containing 200 percent or more, be labeled as single-serving containers.

Other concerns about the proposed upper limit of 150 percent of the standard serving size had to do with a possibility that some manufacturers might increase the size of their product to slightly more than this limit to be able to use a smaller standard serving size. This change would mean that the label information would be misleading to consumers who usually consume the entire amount in the container.

FDA is aware that such misrepresentations may occur in relation to any upper cutoff level that the agency may propose. The agency does not believe that there is a ready solution to this problem. The agency believes that the solution that it is proposing is the most fair, because a manufacturer who provides 200 percent or more of the reference amount is providing two servings of the food under the standards that FDA is proposing. That manufacturer is entitled to label its food accordingly.

Some food industries criticized the proposal to label the total content of a single-serving container as one serving because it would result in different nutritional values appearing on the labels of the same food product, depending upon the size of the container in which the product is packaged. The comments stated that consumers would be confused seeing nutrition information that differs on the same food.

In the notice of public meeting, the agency requested views and data on whether differences in the listing of the nutritional content of the same food would be confusing to consumers. No data on this issue were presented at the meeting or in written comments.

FDA continues to believe that nutrition information based on the entire content of the container for small containers that are usually consumed at a single-eating occasion is most meaningful to consumers because it reflects the nutrient content of the quantity of food that is customarily consumed in the circumstances. Moreover, a large number of consumers requested that FDA require that nutrition information on these products be provided for the entire contents of the container.

Some industry comments stated that it was unnecessary to define single-serving containers at all. One industry comment supported defining a single-serving container to be whatever a manufacturer chooses to call a single-serving. However, consumers repeatedly complained about multiple servings declared on some obviously single-serving products such as soft drinks. Therefore, FDA considers it essential to define single-serving containers.

One industry comment addressed the question of how to define single-serving containers using criteria not related to an amount consumed, e.g., whether the package is recloseable.

FDA does not believe such criteria would be practical or meaningful. With the introduction of the recloseable plastic bag and other type of closures, any container can be made recloseable regardless of the package size.

Comments suggested that FDA establish a lower cutoff level, or that it allow a smaller amount, such as 50 to 75 percent of the standard serving size to be labeled as a half serving. These comments were based on concerns about the possibility that serving sizes could be manipulated in a way that would result in the abuse of adjectival descriptors like "low sodium." Many consumers and health professionals who commented on single serving containers expressed concerns about such abuse.

In § 101.12(g), FDA is proposing that both the serving size declared on the label and the reference amount be used in determining whether a food meets the definition for an adjectival descriptor. Use of both the label serving size and the reference amount will prevent a single-serving container from qualifying for the descriptor based on package size alone. Also, elsewhere in this issue of the **Federal Register**, FDA is proposing regulations for adjectival descriptors that the agency believes will also prevent abuses in their use. Therefore, at this time, FDA does not consider it necessary to define a lower limit for single-serving containers. If a lower limit becomes necessary for reasons other than concern about adjectival descriptors, the agency will reconsider this issue.

Based on all of the information presented to the agency, FDA believes that: (1) Single-serving containers should be defined, (2) it is desirable to increase the upper limit, and (3) there is no basis to establish a lower limit at this time. Therefore, in § 101.9(b)(6) of this reproposal, FDA is proposing to require that manufacturers declare that there is a single-serving in a container or package that contains less than 200 percent of the reference amount proposed in § 101.12(b), and that they declare nutrition information based on the total content of the container.

A few industry comments stated that there should be no upper limit on single-serving containers.

The agency would not consider it appropriate to label a very large container, e.g., a half gallon of ice

cream, as a single-serving container. However, to provide flexibility, in § 101.9(b)(6) of this reproposal, the agency is proposing to allow the manufacturer to declare a single-serving on relatively small containers containing 200 percent or more of the reference amount if the entire content of the container can be expected, reasonably, to be consumed at a single-eating occasion. The determination for reasonableness should be based on food consumption data under actual conditions of use. Manufacturers should be prepared to provide the agency with the data that supports the single-serving claim upon request. The agency is aware that this allowance has a potential for misuse. The agency intends to consider regulatory action for misuse of this allowance.

FDA requests comments on the new upper limit for single-serving containers and on whether it is reasonable to allow the manufacturer to determine the single-serving status above that level.

D. Proposed Reference Amounts for Serving Sizes

1. Introduction

In § 101.12(b) of the 1990 proposal, FDA proposed standard serving sizes for 159 product categories that were primarily based on the amount commonly consumed by the relevant population (i.e., persons 4 or more years of age, infants, or toddlers) as reported in the 1977–1978 Nationwide Food Consumption Survey (NFCS) conducted by USDA. The proposed standard serving sizes were generally expressed in U.S. units.

The 1990 amendments require that FDA establish standards to define serving size (section 2(b)(1)(B) of the 1990 amendments). To implement this requirement, FDA is proposing to establish procedures under which manufacturers would derive the appropriate serving size from the reference amounts in § 101.12(b), instead of establishing specific serving sizes.

Before discussing the reference amounts and the other procedures for determining serving size, FDA wishes to respond to comments that it received on the methodology that should be used in determining serving sizes.

1. About two-thirds of the comments on the 1990 proposal, that addressed the methodology question agreed with FDA's approach of using food consumption data. The other comments suggested that other or additional sources be used, such as longstanding industry serving sizes, serving sizes currently in use, the serving sizes in dietary guidance or educational materials, diabetic food exchange lists, and USDA Handbook number 72, entitled "Nutritive Value of Foods."

Discussion at the public meeting focused largely on this issue. Two consumer organizations supported FDA's use of food consumption data as the basis for establishing serving sizes. One organization stated that the 1990 amendments require the use of only food consumption data in establishing serving sizes. However, most other presenters stated that, in addition to food consumption data, other information such as those listed above, should be used as supplementary sources for determining serving sizes for nutrition labeling purposes.

Section 403(q)(1)(A)(i) of the act has the effect of requiring the use of food consumption data as the primary basis for the serving size determination. FDA believes that without such data, it is impossible to determine the amount of food that is customarily consumed. However, FDA believes that other information related to serving size can be useful, particularly when food consumption data are inadequate. The agency used several additional sources of information in arriving at the reference amounts proposed in § 101.12(b). These additional sources, and when and how they were used, are described in sections IV.D.3.c. and IV.D.3.d. of this document.

With regard to longstanding industry serving sizes, in the February 26, 1991 notice for the public meeting, FDA requested comments and supporting data on the definition of "longstanding" serving size. One comment stated that longstanding serving size should include serving sizes used before 1973, as a minimum, and presented three examples of serving size used before that date.

Since it had no established definition or sufficient data to define longstanding serving sizes, the agency took into consideration all serving sizes suggested in comments regardless of their history of use and serving sizes currently on product labels in arriving at the reference amounts (Ref. 2).

FDA does not consider the diabetic exchange lists to be an appropriate source to use in determining serving size under the act for several reasons. Serving sizes contained in the diabetic exchange lists are tailored so that each food choice within an individual exchange list will provide similar amounts of calories, protein, carbohydrate, and fat (Ref. 5). Therefore, the driving force in determining the serving size for the exchange lists is calorie content and content of energy-producing macronutrients, not an amount of food customarily consumed as required by the act. Consequently, many different specific serving sizes are given for individual foods that belong to the same category. For example, several serving sizes are given for frozen desserts, ¼ cup for sherbet, ⅓ cup for frozen yogurt, and ½ cup for ice cream. Also, the serving size for some foods is very small, e.g., one-half English muffin, which does not represent an amount customarily consumed by the general population. In addition, FDA does not believe that serving sizes designed to meet a special dietary need of a subpopulation that has a unique health problem are appropriate to use as serving sizes for the nutrition labeling of products for the general population.

FDA does not consider the serving sizes in any USDA Handbooks, including number 72, to be an appropriate source given the definition of "serving size" in the act. Because these Handbooks are not intended to reflect "amount customarily consumed," the serving sizes in them are not based on food consumption data and are not necessarily representative of an amount customarily consumed. In addition, these handbooks list a limited number of the prepared and packaged foods (e.g., frozen entrees) that are subject to mandatory nutrition labeling.

2. Some industry comments contended that many currently used serving sizes have been used for many years and are familiar to consumers, and therefore that changing them could be confusing.

The act defines serving size as an amount customarily consumed. Thus, the primary basis for serving size must be consumption data, not current labeling practices. Furthermore, a professional nutrition association commented that its members have reported that consumers are generally unaware of the serving sizes that are used by industry. At the public meeting, a consumer organization presented similar data from its own informal survey. Based on this information, the agency does not believe that it would be confusing to consumers to make changes in currently used serving sizes.

3. Industry comments also stated that some of the serving sizes in current use were established cooperatively with FDA.

The agency acknowledges that, in the absence of a formal regulation and upon the request of different segments of the food industry, it has provided advisory opinions on serving size on a food-by-food basis. These advisory opinions have not gone through rulemaking procedures. FDA is now required by law to develop a serving size regulation for all food products based on an amount

that is customarily consumed. Therefore, the proposed reference amounts listed in § 101.12(b), and the label serving sizes derived under the procedures proposed in this document, will supersede all advisory opinions previously given to the industry.

4. Some industry comments objected to the use of only food consumption data in determining serving sizes on the basis that:

(1) Food consumption data have known inaccuracies;

(2) The amount per eating occasion does not reflect the multiple servings or "helpings" that may be consumed at a single-eating occasion;

(3) The data used for the proposal were more than a decade old and eating habits may have changed; and

(4) Food consumption data are not the recommended amounts in terms of diet and health. Some nonindustry comments also supported the use of more recent data such as data from 1987–1988 NFCS.

FDA acknowledges that the 1987–1988 NFCS data may have inaccuracies (e.g., underreporting of intakes) as food consumption surveys usually do. However, food consumption survey data, such as NFCS, provide objective estimates of amounts of food customarily consumed. The NFCS is nationally representative and represents the most comprehensive data on food consumption practices of the U.S. population that are available to the agency. In using the food consumption data, the agency sought to ensure that the amount reported was reasonable (see section IV.D.3.d. of this document). As for multiple helpings or servings, it is very likely that some people reported amounts that represented multiple helpings or servings because the total reported by such people represents the amount that they customarily consume at a single eating occasion.

Since the 1990 proposal was published, USDA has released the final data tape for the 1987–1988 NFCS. FDA analyzed this new survey data in developing the proposed reference amounts, as discussed in section IV.D.3.a. of this document.

The argument that serving sizes should be recommended amounts in terms of diet and health is not consistent with the requirement of the act. The act defines serving size as "an amount customarily consumed" and not an amount recommended to promote health.

5. Several comments on how to calculate customarily or commonly consumed amounts included suggestions for: (1) the use of the median instead of the mean because mean is more likely influenced by outlier values than the median, (2) the use of the mode (that is, the most frequently consumed amount), (3) inclusion of the sample size in the criteria, (4) consideration of the demographics of "key" consumers and avoidance of data skewed by nonprimary users, and (5) the use of the lowest common denominator in household measures for a product (e.g., 1 oz for cheese, one slice for bread).

In determining the standard serving sizes proposed on July 19, 1990, FDA used the amount consumed per eating occasion (hereinafter referred to as "consumed serving size (CSS)") by an individual as the basis for serving size. To estimate the amount commonly consumed by a population group, the agency used both the mean and the median CSS for the group, with the mean as the driving force and the median as a guide in rounding the value to a meaningful household measure. For example, if the mean was 2.3 oz and the median was 1.6 oz, the agency rounded the mean down to 2 oz rather than up to 2.5 oz. FDA believes that both the mean and the median CSS are valid values for determining the customarily consumed amount, and that the exclusion of one or the other is not desirable.

Regarding the suggestion for use of the mode, FDA performed additional data analysis for this reproposal to include the mode. The mode was not useful, however, as the sole criterion for determining the reference amount because most food groups had two or more modes, and there usually was no obvious or rational basis to choose one over the other. However, the mode did provide additional guidance in determining the reference amount. The agency also took the sample size into consideration in developing the reference amounts, as discussed in sections IV.D.3.d. of this document.

Concerning the suggestion to consider the demographics of "key" consumers and avoidance of data skewed by nonprimary users, the NFCS survey design took into consideration the demographics of all users, and "key" users usually determine the customarily consumed amounts (i.e., mean, median, and modal CSS values). The mean is influenced by outliers, but this influence is lessened as sample size increases. The consideration of sample size, and the median and modal CSS values, which are less influenced by the outliers or skewed data, further improved the determination of the reference amounts in this reproposal.

Finally, with respect to the suggested use of the lowest common denominator, in light of the requirement of the act that serving size be the amount customarily consumed, FDA does not believe that use of the lowest common denominator is legally allowable except when it represents the customarily consumed amount.

6. Another industry comment stated that a weighted average is not appropriate for determining serving size because there are too many varieties of a product/food item.

FDA is well aware of the large variety of food products in the marketplace. One reason why the agency could not establish serving sizes for a limited number of broad categories as recommended by the IOM report is the large variety of food products (see section III.A. of this document). Consequently, the agency performed extensive data analysis to ensure that only foods similar in dietary usage and consumption size were included in a proposed product category. FDA continues to believe that a reasonable reference amount can be established for all product categories by grouping foods that are similar in dietary usage and consumption size.

7. Several oral presentations at the public meeting and written comments that FDA received in response to the meeting notice stated that the amount "customarily consumed" is highly variable and is related to a number of factors such as the age and sex of the individual. Some industry comments stated that the amount of food customarily or typically consumed is also affected by such factors as how a food is packaged and positioned in the marketplace (e.g., as a snack or entree), and that the average consumed amount is difficult to define for many food products because of their many uses and varying consumption at different times of day.

FDA acknowledges that the high variability among individuals in the amounts that are customarily consumed may reduce the value of a reference quantity to any one individual who is not consuming servings of foods that are approximately the size of that reference quantity. Therefore, FDA is also proposing to permit manufacturers to present nutrient values based on a uniform unit (e.g., 100 g or 1 oz), in addition to the declaration of nutrients on the basis of a serving. Such presentations may, in some circumstances, facilitate comparisons of different kinds of the same food. Furthermore, such presentations may also facilitate comparisons of foods belonging to different food groups.

In addition to the variability among individuals, FDA recognizes that the diverse nature of food products also complicates the process for determining

reference amounts. However, national food consumption surveys, including USDA's NFCS, have many factors built into the survey design that make it possible to estimate food consumption patterns representative of the U.S. population. Sample persons in the survey are selected by statistical procedures that ensure representation of all ages, both sexes, and other demographic and socio-economic characteristics of the U.S. population. Dietary intake information is collected throughout the day so as to cover many different uses (e.g., as snacks vs. entrees) and varying consumption at different times of day (e.g., breakfast vs. dinner). Therefore, many concerns raised in the comments are addressed by the design of the NFCS survey.

The agency is willing to consider any data that may give a better estimate of an amount customarily consumed for a specific product category. Although FDA received some data in the comments, these data were unacceptable for various reasons. For example, the estimates were not representative of the food consumption practices of the relevant population group; the data were inappropriate because of flaws in the study design; or there was poor documentation of the methodology. In section K (Petition Process), the agency is proposing general guidelines on how to conduct a survey and to collect data to support a request for change in a proposed reference amount or to establish a reference amount for a subcategory of food or a product category not covered by this reproposal.

FDA is well aware of the fact that an amount of food customarily consumed is highly variable among people who differ by age, sex, body build, life style, and other attributes. The agency wishes to make it clear that it is not trying to estimate accurately serving sizes that apply to any particular individual. As pointed out in the 1990 proposal, neither the reference amount nor the serving size declared on the product label are to be interpreted as recommended amounts for consumption. Rather, given the particular product category, the reference amount, which may be modified somewhat as the serving size on the product label because of the size and shape of the product, represents the amount of that type of food that is customarily consumed by persons in a particular population group (e.g., by all persons 4 years of age or older).

8. One of the general principles that FDA followed in arriving at the standard serving sizes in the 1990 proposal was that a serving size should be based on only the edible portion of food, and not bone, seed, shell, or other inedible components. The National Fisheries Institute commented that serving sizes for fish cannot always be based on edible weight because bones cannot be separated from flesh.

FDA believes that the fish industry should be able to estimate the edible portion of the fish from its own data or other standard statistical data that provide percent refuse information, e.g., USDA Handbook No. 102 entitled "Food Yields Summarized by Different Stages of Preparation" (Ref. 18).

9. Some comments that agreed with the use of food consumption data expressed reservations about some specific aspects of the 1990 proposal. The Association of State and Territorial Officials stated that the basis for serving sizes should be the average amount consumed by an adult. A few health professionals commented that it was unrealistic to calculate average amounts from food consumption data that include all persons 4 years of age and older because of the large differences in the amount of food eaten.

FDA proposed two sets of standard serving sizes in the 1990 proposal, one for infant and toddler foods and one for the general food supply. Infant and toddler foods were presented separately because these foods differ from the general food supply in that they are specially processed for consumption by infants or by very young children. Children 4 years of age and older generally eat from the same food supply as the rest of the family.

FDA acknowledges that there are large differences in the amounts consumed among persons 4 years of age or older. Having several sets of serving sizes for different age subgroups of the general population category would likely produce serving sizes more realistic for each subgroup. However, several columns of nutrition information, one for each age subcategory, would be required on the labels of many products. These additional columns would be unreasonable and impractical. As pointed out earlier, neither the reference amount nor the serving size declared on the product label are amounts recommended for consumption. They represent reasonable quantities of foods for declaring nutritional values. Accordingly, FDA is proposing one set of reference amounts for all persons 4 or more years of age.

10. A baby food manufacturer commented that the amount customarily consumed is not appropriate for foods intended for infants and children because their intakes vary markedly, and mothers could interpret the serving size as a recommended amount.

FDA believes that this comment misunderstands the purpose of a serving size. The serving size declared on the product label is not an amount recommended for consumption. It is, by statute, the amount customarily consumed.

FDA believes that this type of misunderstanding can best be addressed through public education. The agency's promulgation of nutrition labeling regulations will be followed by a consumer education program to assist consumers in using the nutrition information on the label.

The company suggested using the jar (i.e., the entire content of the jar) as the serving size. The act requires serving size to be the amount customarily consumed and, therefore, jar size cannot be used as the basis for determining the reference amount which, in turn, determines the label serving size, unless the jar size agrees with the customarily consumed amount. The reference amounts for baby foods in § 101.12(b) are the amounts customarily consumed by infants, from which the manufacturers are to determine the label serving size for their products. Because most small jars currently in the marketplace meet the definition for single-serving containers, nutrition information for most baby foods would be provided on a per jar basis. However, an increasing number of multi-serving containers of baby foods are entering the market. The label serving size based on the reference amount enables nutritional comparison of these products.

11. One industry comment on the 1990 proposal stated that, because FDA selected foods having a high frequency of consumption to represent the category instead of using all foods appropriate for the category, the agency results were incorrect. The company further claimed that FDA's misclassification of the pourable salad dressings category led the agency to inappropriately set the serving size for pourable salad dressings at 2 tablespoons rather than 1 tablespoon. The company submitted results of its own analysis which supported 1 tablespoon.

FDA reexamined its original food selection scheme and repeated the data analysis using all foods relevant for the category. The results reaffirmed the appropriateness of the original food selection strategy and the accuracy of the results published in the 1990 proposal (Ref. 19).

12. A government agency commented that some product categories were not sufficiently descriptive, making it difficult to make proper categorization of products. A few industry comments stated that they had difficulty in identifying the product category in which their products belong and requested additional categories. Products cited in the comments were fish sticks and sandwiches.

Fish sticks are included in the category of "Fish, shellfish, and meat or poultry substitutes: entrees (cooked) without sauce" (renamed in this reproposal as "Fish, Shellfish, and Meat or Poultry Substitutes: Entrees without sauce"). In the 1990 proposal, sandwiches were included in the category of "Meal type trays: Lunch or dinner trays, Sandwich." For this reproposal, sandwiches are included in the category of "Mixed dishes: Not measurable with cup * * *."

To help manufacturers and others to identify the category in which their specific products fit, the agency has provided an extensive list of products for each product category (Ref. 20). FDA has also modified the names of some product categories to be more descriptive.

13. A few industry comments stated that there should be two serving sizes for some foods (e.g., rice), one for its use as a side dish and one for its use as an entree.

FDA rejects this suggestion for three reasons. First, one of the uses of the reference amount is to determine the appropriateness of nutrient content and health claims made for food products. Such a determination cannot be made on two or more different bases (i.e., standards), e.g., a smaller reference amount to evaluate a claim for a side dish and a larger reference amount to evaluate a similar claim on a similar product labeled as an entree.

Secondly, there is no assurance that a product labeled as a side dish will not be consumed as an entree, and vice versa. Thirdly, FDA does not believe that this suggestion is in the best interest of the consumers. Two reference amounts will interfere with the goal that there be uniformity among serving sizes declared on similar products by different manufacturers.

The agency would not object, however, to manufacturers providing a second column of nutrition information based on an alternative serving size as a side dish or as an entree. However, the agency wants to make it clear that it will use the reference amount to evaluate whether the product meets FDA standards for any claim made for the product.

14. A consumer organization pointed out that a manufacturer of liquid cream substitutes uses 1 tablespoon as the serving size for nutrition labeling but promotes the product for use with breakfast cereal. Because the amount of the cream substitute consumed with the breakfast cereal is much larger (e.g., 1/2 cup or 8 tablespoons) than when used as a coffee whitener, the nutrition information based on 1 tablespoon is misleading to consumers who use the product with breakfast cereals.

FDA agrees with the comment that nutrition information based on 1 tablespoon, which is the customarily consumed amount of this food, is misleading to consumers who use the product with breakfast cereals as suggested by the manufacturer. This type of promotion can happen to any product. To prevent such misleading labeling, in § 101.9(b)(11) of this reproposal, FDA is proposing that if a product is promoted on the label, labeling, or advertising for a use that differs in quantity by twofold or greater from the use upon which the reference amount in § 101.12(b) is based (e.g., liquid cream substitutes promoted for use with breakfast cereals), the manufacturer must provide a second column of nutrition information based on the amount customarily consumed in the promoted use, in addition to the nutrition information per serving derived from the reference amount in § 101.12(b).

15. An industry comment pointed out that portion size varies greatly for all foods used as ingredients.

FDA acknowledges that ingredient usage of a food varies widely depending on the recipe, and food consumption surveys do not usually provide information useful for determining portion size. When survey data were not available, FDA used various alternative approaches to estimate the portion sizes in the 1990 proposal such as the portion size for flour. FDA used similar methods in determining the reference amounts for portion sizes in this reproposal. The technical report on this reproposal (Ref. 2) documents the basis for each portion size proposed.

16. A manufacturer of "cooking sauce" e.g., soy sauce, teriyaki sauce) suggested using the average amount used in recipes to determine a portion size of cooking sauce.

Some "cooking sauces" (e.g., soy sauce) are used both in the form as purchased and as an ingredient of other foods. As discussed above, ingredient usage varies widely depending on the recipe and there is no easy way to determine the customarily consumed amount of these sauces using recipes. NFCS does provide some estimates of the consumed serving size of these sauces in the form purchased. Therefore, the NFCS data are the best information available, and FDA used them to determine the reference amount for the "cooking sauces."

2. General Principles Considered in Developing Reference Amounts

The act defines serving size as the amount customarily consumed which is expressed in a common household measure that is appropriate to the food. Although the amount customarily consumed is similar in weight or volume, in many instances, the customarily consumed amounts in household measures differ for different products within the same category because they come in different shapes and sizes. For example, food consumption data show that the amount customarily consumed for vegetables without sauce is about 85 g. A common household measure for this amount of green peas and cut corn would be about 1/2 cup, whereas many other vegetables come in the form that cannot be measured with a cup, e.g., brussels sprouts and broccoli spears. A common household measure appropriate for the latter vegetables would be pieces or oz. Because there is no uniform household measure that can be used for vegetables, the most reasonable approach for this type of food is to establish the reference amount in g and to let the manufacturers determine the label serving size in a common household measure that is most appropriate to their specific products.

FDA, therefore, decided to propose reference amounts that represent the amount customarily consumed of the products within the category, which manufacturers can use as the guide to determine the label serving size in common household measures that are most appropriate for their specific products. To determine the reference amount of food, FDA used the general principles and procedures described in this and following sections. The general principles, which are reflected in proposed § 101.12(a), are:

a. The reference amount represents the amount of food that is customarily consumed per eating occasion by the relevant (target) population group as determined by data from an appropriate national food consumption survey. This principle links the reference amount, and thus the label serving size, to food consumption data as required by the act.

b. An appropriate food consumption survey is one that includes a large sample size representative of the demographic and socio-economic characteristics of the target population

group for which the food is intended and that is based on consumption data under actual conditions of use. Use of such a survey will ensure that the customarily consumed amount determined is a reliable estimate that is representative of all sectors of the U.S. population that consume the food and that reflects the amount that they actually consume.

c. Three target population groups, infants, toddlers, and the general population are relevant for estimating customarily consumed amounts of food. In another technical supporting proposal published in the **Federal Register** of July 19, 1990, entitled "Food Labeling; Reference Daily Intakes and Daily Reference Values" (55 FR 29476), FDA identified five age groups for nutrition labeling purposes. The five groups are infants, toddlers, pregnant, lactating, and the general population group. The agency is not aware of any foods in the food supply which are specially processed for use by pregnant or lactating women. Therefore, customarily consumed amounts will be estimated only for three age groups: foods intended for the general population, i.e., persons 4 years of age or older; foods specifically formulated or processed for use by infants up to 12 months of age; and foods specially formulated or processed for use by toddlers 1 through 3 years of age.

d. To determine the reference amount, all three statistical estimates that represent an amount customarily consumed, the mean (i.e., average), the median (i.e., 50th percentile value), and the mode (i.e., most frequently consumed amount) of the consumed amount per eating occasion should be considered.

e. In addition to food consumption data, other relevant information on serving sizes of food, such as that listed below in section IV.D.3.c. of this document, should be taken into consideration, particularly when survey data are insufficient to give a reliable estimate of the amount customarily consumed.

f. The reference amount and, in turn, the serving size declared on the product label must be based on the edible portion of the food because the inedible parts, such as bone, seed, shell, or rind, are not consumed and thus do not contribute to the nutritional value of the food.

g. Many foods are consumed both as a serving (i.e., in the form as purchased) and as a portion (i.e., as an ingredient of other foods). For example, butter and margarine are consumed in the form as purchased and as ingredients of foods such as cookies and cakes. Because the amount of such foods used as an ingredient (i.e., portion size) varies from recipe to recipe, and there usually is no easy way to determine the amount customarily consumed using recipes, the most reasonable approach for estimating the reference amount for these foods is to base it on the amount customarily consumed in the form purchased.

h. The reference amount must reflect the major dietary use of the food when this information is available because the major usage determines the customarily consumed amount. For example, milk may be used as a beverage or as a liquid to add to coffee or cereal. Because the major usage of milk is as a beverage, the reference amount for milk must reflect the amount consumed as a beverage.

i. The reference amount must be uniform for foods that are similar in dietary usage, product characteristics, and customarily consumed amount. For example, chips and other similar snacks (e.g., pretzels and extruded snacks) must have the same reference amount because these foods are consumed in similar manner, are used interchangeably in the diet, and have similar customarily consumed amounts. Uniformity in reference amounts for similar products will enable consumers to make nutritional comparisons of these products.

3. Determination of Reference Amounts for Serving Sizes

This section describes the detailed procedures that FDA used to apply the general principles described above in determining the reference amounts.

a. *Selection of food consumption data base.* FDA needed a food consumption data base that contained individual food intake data representative of the food consumption practices of the three age groups of interest. In determining "standard serving sizes" for the 1990 proposal, FDA chose, from the several national food consumption survey data bases then available, USDA's 1977–1978 NFCS (Refs. 21 through 24). FDA did so because this data base contained: (1) The largest number of persons, 30,777; (2) data on 3-day dietary intakes; and (3) data for all ages. Data from more recent nationwide food consumption surveys (e.g., the NFCS conducted by USDA in 1987–1988 and the third National Health and Nutrition Examination Survey (NHANES III) conducted by the Department of Health and Human Services) were not available. Since the 1990 proposal was published, USDA released the final data tape for the 1987–1988 NFCS (Ref. 25). Dietary intake data from NHANES III are not yet available.

FDA used the 1987–1988 NFCS as a source of food consumption data representative of more recent food consumption practices of the three age groups identified for nutrition labeling purposes. This new survey, however, had an unusually low response rate (Refs. 26 and 27). If the 1987–1988 NFCS had a higher response rate, the new survey data would have been preferable to the 1977–1978 NFCS data for determining the reference amounts of food because of its recency. However, the low response rate limited the use of the new NFCS data base because there is no way to know if respondents and nonrespondents behave in the same way. If the consumption behavior of nonrespondents is different than that of respondents, the results of the 1987–1988 NFCS are not representative of the amount customarily consumed of all users in the relevant population group.

Therefore, FDA used both the 1977–1978 and 1987–1988 survey data in developing the reference amounts. When the results from the 1987–1988 NFCS suggested a change in food consumption practices since the 1977–1978 NFCS (e.g., consumption increased or decreased substantially), FDA used other recent USDA data that did not have a response rate problem, namely, the 1985 and 1986 Continuing Surveys of Food Intakes by Individuals (CSFII's) (Refs. 28 and 29) to confirm the trend change. As discussed in the technical report prepared in support of the 1990 proposal (Ref. 17), the CSFII could not be used as the data base for determining customarily consumed amounts of food because it included neither the infant population nor the whole population of persons 4 years of age or older. However, it is an appropriate data base for the limited purpose that FDA used it. If the validity of the trend was supported by the CSFII data, FDA used the 1987–1988 NFCS data. Such a validity check to confirm the trend change observed in the 1987–1988 NFCS was recommended by an expert ad hoc committee that evaluated impact of nonresponse in the 1987–1988 NFCS (Ref. 26).

b. *Determination of the product categories.* This section provides a detailed description of how FDA applied the general principles outlined above to develop the 131 product categories.

i. *Step 1.* FDA started out with the 9 major food groups used by the USDA for the NFCS (Ref. 2). The 9 groups are milk and milk products; meat, poultry, fish, and mixtures containing these products; eggs, mixtures with eggs, and egg substitutes; dry legumes, nuts, and seeds; grain products; fruits; vegetables;

fats, oils, and salad dressings; and sugars, sweets, and beverages.

FDA further divided the foods within each of these major food groups into smaller groups by product class. For example, it divided milk and milk products into such groups as milks, cheeses, and ice creams. The agency then further divided foods within each of these product classes into subgroups according to dietary usage and other characteristics that were likely to affect the levels of consumption of foods within the product class. For example, FDA divided cream and cream substitutes into two subgroups, fluid forms and powdered forms; and pickles into 5 subgroups: dill pickles, sour pickles, sweet pickles, relishes, and olives. The agency grouped the foods in this way to assure that only those foods that were likely to have similar levels of consumption were included in the final food group used to determine the amount customarily consumed. The resultant food groups represented the preliminary product categories.

USDA's major food grouping system classified foods by the major ingredients of the food. Thus, under this system some foods that belong to the same product category, like soups, are not listed together but rather are separated into several major food groups depending on the major ingredients. For example, meat, poultry, or seafood-based soups are included in the meat, poultry, and fish group. Split pea soup is included in the dry legumes, nuts, and seeds group; grain-based soups are included in the grain products group; and vegetable soups are included in the vegetable group. In identifying preliminary product categories, FDA grouped all soups into one category.

ii. *Step 2.* FDA further refined the preliminary product categories by selecting foods available in the marketplace to represent the category. This selection was necessary because the NFCS lists foods on an as consumed basis, and thus, many foods that are not available in the marketplace are on the list. For example, breads are listed both in toasted and untoasted forms. FDA did not use toasted breads for the CSS analysis because this form is not available in the marketplace. In addition, when incomplete information was obtained from survey respondents, foods in the NFCS data base were often described as "not further specified (NFS) as to * * *." When these NFS foods were likely to contain foods that may differ in consumed serving size, FDA excluded them from the CSS analysis. For example, "salad dressing, not further specified" (food code 831-0010) was not used to estimate the CSS value for pourable dressings (e.g., French dressing, Italian dressing) or for nonpourable dressings (e.g., mayonnaise) because this food code is likely to contain both pourable and nonpourable dressings which may differ in consumed serving size.

iii. *Step 3.* FDA determined the mean, median, and modal CSS per eating occasion for each preliminary product category (see Ref. 2 for more detailed description and data).

iv. *Step 4.* The survey data expressed the amount of food consumed in g. Therefore, FDA converted the g weight of the mean, median, and modal CSS values determined in step 3 to measures that are more meaningful for nutrition labeling purposes, i.e., to household measures such as oz, fl oz, cups, tablespoons, and teaspoons. The agency used the gram-to-household measure, described in USDA's manuals showing the relationship for the common measure and g weight (Refs. 30 and 31), to convert g weights to household measures. This conversion of the g weight to household measures was done to ensure that foods similar in CSS values in household measures are grouped together and that the reference amounts derived from the survey data are meaningful in household measures, which are the label serving size units required by the act. For example, the median CSS value for mixed dishes without sauce appears to be much lower than that for mixed dishes with sauce in g weight (157 g vs. 249 g), giving a false impression that the two products have different CSS values. However, when converted to a cup measure, which is the common household measure for these products, the CSS values for the two products are more uniform (0.9 vs. 1.1 cup). This similarity reflects the fact that while the g weight of 1 cup of mixed dishes without sauce is much lower (about 150 to 200 g) than the g weight of 1 cup of mixed dishes with sauce (about 220 to 250 g), they are consumed in similar amounts in terms of volume. Therefore, expressing CSS values in household measures showed clearly that the same reference amount applies to both mixed dishes with and without sauce.

In converting the g weight to the household measure for the purpose of developing reference amounts, the agency used the following general criteria in determining whether weight or volumetric measures should be used: It used volumetric measures: (1) for beverages (in fl oz) and (2) if all foods in the food group are usually measured on a volume basis by consumers, e.g., honey, syrups, preserves, and salad dressings. It used weight measures: (1) if foods in the food group are usually not measured on a volume basis or are in distinct units, e.g., fish, muffins and pizzas; or (2) if some foods in the group are often measured by weight, but others are measured by volume (e.g., for fruits and vegetables, small berries and green peas may be measured by volume (cup), but many whole fruits and vegetables (e.g., broccoli spears) cannot).

v. *Step 5.* FDA collapsed the product categories further to combine product categories that had similar dietary usage or CSS values in household measures to reduce the number of product categories. For example, mayonnaise, sandwich spread, and mayonnaise-type dressings, in the fats and oils category, had similar CSS values, and thus FDA combined them into one product category.

vi. *Step 6.* Because food consumption surveys report amounts of foods as consumed, many foods that are primarily used as ingredients (e.g., flour, pie crust) were not on the NFCS food list. FDA added categories for these and a few other products that were not reported in the NFCS but that were identified through comments and informal checking of the products available in the Washington, DC metropolitan area to the preliminary category list. The resulting list of product categories represented the final product categories.

c. *"Other information" related to serving size.* To respond to recommendations in the IOM report and to comments requesting the use of other relevant information in addition to food consumption data and to promote international harmonization, in addition to the food consumption data, FDA used the following information in developing the proposed reference amounts in § 101.12(b).

i. Serving sizes recommended by dietary guidance recommendations and other authoritative systems or organizations (Refs. 3 through 8).

ii. Serving sizes recommended in comments on the 1990 proposal and in response to the notice of public meeting.

iii. Serving sizes currently used by manufacturers (e.g., product labels) and grocers (e.g., major supermarket chains).

iv. Serving sizes used by other countries (e.g., Canada).

d. *Procedure for determining reference amounts.* To determine the reference amounts that are proposed, FDA examined both the survey data (CSS values) obtained by the procedures described in section IV.D.3.b. of this

document and the other information listed above. Using the general guidelines described below, the agency determined the proposed reference amount for each product category. The CSS values and the detailed description of how the proposed reference amount was determined for each product category are contained in FDA's technical report (Ref. 2).

i. Because the act requires that food consumption data be used as the primary data source for the serving size determination, in determining the reference amounts for specific product categories, FDA first considered food consumption data and whether it provided an appropriate basis from which to derive reference amounts. In deciding whether the data provided an appropriate basis, FDA considered the adequacy of the sample size and the consistency of the data.

ii. FDA believes that a sample size (number of eating occasions) of 140 or larger is large enough to provide reasonable assurance for a reliable estimate for the customarily consumed amount. This sample size is the same as the minimum sample size used by USDA to present the 5th and the 95th percentile values for the NFCS data (Ref. 32). Although FDA did not use the 5th and the 95th percentile values in developing the reference amounts, it did use the mode. Many product categories had multiple modes, which, to be reliable, must be based on a larger sample size than that which would be necessary to ensure the reliability of the mean or the median values. Therefore, to ensure that the modal values were reliable, FDA used 140 as the cutoff for the adequate sample size, which is the largest minimum sample size required for presenting the NFCS data (Ref. 32).

FDA believes that a sample size of 40 through 139 (intermediate range) may not be large enough to provide reasonable assurance of a reliable estimate of the customarily consumed amount considering the multiple modes observed for many product categories. The lower cutoff level for the intermediate range (40) is the same as the minimum sample size used by USDA to present the 25th and the 75th percentile values for the NFCS data (Ref. 32).

FDA believes that a sample size of less than 40 is inadequate to provide reasonable assurance of a reliable estimate of the customarily consumed amount.

iii. *Steps followed in selecting survey data.* As mentioned earlier, FDA used both the 1977–1978 NFCS and the 1987–1988 NFCS as the source of food consumption data because the 1987–1988 NFCS could not be used alone given the low response rate problem in this survey. The agency used the following guidelines in selecting the survey data for determining the reference amount for each product category:

(A) If the 1987–1988 NFCS data did not substantially differ from the 1977–1978 NFCS data, and the sample sizes for both surveys were equally adequate, data from both surveys were used. The use of data from both surveys increased the data points, i.e., provided two sets of the mean, median, and modal CSS values, rather than one set from a single survey. Therefore, the reliability of the reference amount determined was strengthened.

(B) If the 1987–1988 NFCS data suggested a change in consumption practices since the 1977–1978 NFCS (i.e., CSS values increased or decreased), and the validity of the change was supported by the CSFII data, the new survey data were used because the trend change observed in the 1987–1988 NFCS is likely to be a real change in consumption practices. For example, CSS values from the 1987–1988 NFCS for the popsicles and snow cones category showed a slight but consistent increase in the consumption of these foods. This trend increase was supported by the 1985 and 1986 CSFII's (Ref. 2). Therefore, FDA used the 1987–1988 NFCS data to determine the reference amount for this category.

(C) If the new survey data suggested a change in consumption practices, but the change was not or could not be supported by the CSFII data, the agency made its best judgment based on the available evidence, and it documented the basis for its judgment (Ref. 2). For example, both the median and modal CSS values from the 1977–1978 NFCS (N=98) suggested 2 tablespoons to be a reasonable reference amount for the condensed milk category. The data from the 1987–1988 NFCS suggested a much smaller reference amount, about ½ tablespoon. However, the sample size for the new survey was grossly inadequate (N=11), and thus, this smaller value could not be used. The CSFII had only one observation, and therefore, could not provide any information to support or deny the smaller CSS values observed in the 1987–1988 NFCS. There was no consistency in the serving size recommended in comments, serving size currently in use by the manufacturers and grocers, and the Canadian serving size. The applicable serving sizes from these sources ranged from ¼ cup to ½ cup. Although the sample size fell in the intermediate range, the 1977–1978 NFCS consistently suggested 2 tablespoons to be a reasonable reference amount for the category. Condensed milk is usually used as an ingredient of other foods. Two recipies on the product label showed 2 to 2.5 tablespoons of condensed milk is needed to make 1 serving (Ref. 2). FDA, therefore, chose 2 tablespoons as the reference amount.

(D) If appropriate data were not available in the 1977–1978 NFCS, FDA used the 1987–1988 NFCS data.

iv. If the sample sizes were adequate and CSS values were consistent (i.e., any two of the three types of CSS values (i.e., mean, median, and mode) agreed), the consistent CSS values were used. For example, if the median and mode were 2 oz and the mean was 3 oz, and sample sizes were adequate (i.e., 140 or larger), FDA chose 2 oz as the reference amount for the category. If the sample sizes were adequate, but CSS values did not agree, all three types of CSS values were considered in deciding the proposed amount. For example, if the mean, median, and mode were 2.5 oz, 2 oz, and 1.5 oz, respectively, and the sample sizes were adequate (i.e., 140 or larger), FDA took all 3 values together and chose 2 oz as the reference amount for the category.

v. If the sample sizes were in the intermediate range (i.e., 40 through 139), but CSS values were consistent, the consistent values were used. However, if the survey data were inconsistent, FDA used its best judgment in determining the reference amount and documented the basis for its judgment (Ref. 2). For example, the sample size for the food group that represented the product category "Cake, very light weight, less than 4 g per cubic inch" fell in the intermediate range, but mean, median, and modal CSS values consistently suggested a reference amount of 2 oz. Therefore, FDA chose 2 oz as the reference amount for the category. The sample size for the food group "sundae" fell in the intermediate range and the CSS values ranged from about 1 cup to 1¼ cup. FDA believes that 1 cup is more convenient household measure than 1¼ cup and therefore, is proposing 1 cup as the reference amount for the category.

vi. If the sample sizes were inadequate (i.e., less than 40), FDA used the survey data cautiously. Other relevant information such as those listed in section IV.D.3.c. of this document, was given more weight. FDA documented the basis for its selection of the reference amount on a case-by-case basis (Ref. 2). For example, the food group powdered butter replacement had an inadequate sample size (N=10). The only other relevant information

available was the serving size currently in use by manufacturers, which ranged from ½ teaspoon to 1 teaspoon. Although the sample size fell in the inadequate range, the median and modal CSS values consistently suggested 1 teaspoon to be a reasonable reference amount which is within the range of the serving size currently in use by the manufacturers. FDA, therefore, chose 1 teaspoon as the reference amount for the category.

vii. If multiple food groups represented a product category and CSS values varied among food groups, the food groups having the largest sample sizes were used as the driving force in determining the reference amount for the product category. For example, the product category "cookies, sweet crackers, or sandwich type crackers" includes three food groups: cookies, sweet crackers, and sandwich type crackers. CSS values for these three groups ranged from 0.5 oz to about 2 oz. However, the cookie group had the largest sample size which was about 10 to 50 times as large as the sample sizes for the other two food groups. The CSS values for the cookie group consistently suggested 1 oz. as the reference amount for the category. Therefore, using the cookie group as the driving force, FDA determined the reference amount for the category to be 1 oz.

viii. FDA tried to select a reference amount that approximates a household measure, e.g., the weight of whole units for products in discrete units; ¼ cup increments for products measurable in cups; in whole tablespoons for quantities less than ¼ cup but greater than or equal to 1 tablespoon; in whole teaspoons for quantities less than 1 tablespoon but greater than or equal to 1 teaspoon. These efforts were made to establish reference amounts that are meaningful when expressed in common household measures on the product label.

ix. When survey data were insufficient or not available, FDA followed the following general principles and documented the specific actions that it took (Ref. 2):

(A) If there was no compelling reason to change the standard serving size proposed on July 19, 1990, that is, if no objections had been raised on the proposed serving size, or comments generally supported the proposed serving size, the proposed serving size is being reproposed as the reference amount.

(B) FDA considered any available relevant information. For example, no appropriate information was available to determine the reference amount for cooking wine. A major chain grocer used 1 oz. (which is about equal to 1 fl. oz.) as the serving size for cooking wine in its information booklet. Based on this information, 1 fl. oz. appears to be a reasonable amount for this food for nutrition labeling purposes, and therefore, FDA chose 1 fl. oz. as the reference amount for the cooking wine category.

(C) If there were no consumption data, no other relevant information, and no appropriate alternative, FDA is proposing the reference amount that it believes is the most reasonable for nutrition labeling purposes and has documented the basis for such belief (Ref. 2). For example, there was no information from food consumption surveys or from any other relevant sources, such as those listed in section IV.D.3.c., that could be used in determining the reference amount for the product category, "Baking decorations, e.g., colored sugars and sprinkles for cookies, cake decorations." Customarily consumed amounts for these products are likely to vary considerably depending on how they are used by consumers. FDA believes that 1 teaspoon of these products is sufficient to decorate one reference amount of cookies (i.e., 3 medium-size cookies). Therefore, the agency is proposing 1 teaspoon or 4 g (g equivalent to 1 teaspoon sugar) if the decoration cannot be measured by teaspoon as the reference amount for the category.

x. Several other factors were also taken into consideration in arriving at the reference amounts proposed in § 101.12(b). These factors when used were documented for case-by-case (Ref. 2).

(A) Proposed reference amounts for related products (e.g., consideration of proposed reference amounts for other fruit categories in determining the reference amount for a fruit category).

(B) Whether the amount is comparable to the reference amounts for products that are used interchangeably and are similar in product characteristics (e.g., potato salad and pasta salad).

(C) For products containing two or more foods, whether the amount approximates the sum of the proposed reference amounts of the component foods. For example, the proposed reference amount for a pie should approximate the sum of the reference amount for pie crust and the pie filling.

e. *Expressing the Reference Amounts.* FDA followed the following principles in expressing the proposed reference amounts that were developed using the general principles and procedures described above.

i. Reference amounts are expressed in metric units (g, mL).

ii. Reference amounts for fluids are expressed in mL. Reference amounts for other foods are expressed in g as much as possible. However, when foods within a product category vary considerably in density, and the CSS values for different products are more uniform when expressed in volume than in grams, reference amounts are expressed in household volumetric measures such as cups, tablespoons, and teaspoons instead of g. For example, the median CSS values for three subcategories of ready-to-eat breakfast cereals weighing less than 3 oz. per cup ranged from 25 g to 56 g, but the CSS values in terms of cups were 1 cup for all three categories (Ref. 2). Therefore, the agency is listing the reference amount for breakfast cereals weighing less than 3 oz. per cup in terms of volume, i.e., 1 cup.

iii. When FDA found that the reference amount was best expressed in mL, it followed the following principles:

(A) For volumes of greater than 30 mL, the volume is expressed as a multiple of 30 mL. FDA has done so to assure that when the reference amounts are converted to the label serving sizes in common household measures, they will be in ¼ cup increments as required in § 101.9(b)(5) and in a whole number of fl. oz., if manufacturers voluntarily provide the equivalent fl oz. measure.

(B) For volumes of less than 30 mL, the volume is expressed in mL equivalent to a whole number of teaspoons or one tablespoon. For example, FDA found 1 teaspoon as a reasonable reference amount for lime and lemon juice and therefore, the reference amount is expressed as 5 mL, the mL equivalent to 1 teaspoon.

iv. In expressing reference amounts in g, FDA used the following principles:

(A) For quantities of greater than 10 g, weights are expressed in the nearest 5 g increment to avoid the appearance of an overly exact g weight. For example, FDA expressed reference amounts that it determined to be 2 and 3.5 oz. as 55 g and 100 g, respectively, instead of 56 g and 98 g. FDA believes that the use of an exact g weight is not desirable because it implies an accuracy that the food consumption data and other relevant information sources used to develop the reference amount do not really provide.

(B) For quantities of less than 10 g, exact g weights are used because rounding to the nearest 5 g increment would introduce too much error to the customarily consumed amount.

4. Presentation of Reference Amounts

The reference amounts developed through use of the general principles and procedures described above are proposed in § 101.12(b). Paragraph (b) contains two tables. Table 1 lists proposed reference amounts for foods represented or intended for use by infants and toddlers, and Table 2 lists proposed reference amounts for foods intended for use by persons 4 years of age and older. For both tables, the agency based the calculations on the appropriate CSS values reported for the particular group. Because there are only a few products on the market specifically intended for toddlers, the agency grouped these foods with baby foods. However, in analysis of consumption of toddler foods, the agency used the amounts customarily consumed by children 1 through 3 years.

Unless the reference amount is specifically stated for the unprepared form (e.g., dry form) of the product, the reference amounts proposed in Tables 1 and 2 represent the amount of the ready-to-serve, or almost ready-to-serve (i.e., "heat and serve," "brown and serve"), form of the product. Heat and serve products include products which are fully cooked and require only heating before consumption, e.g., a fully cooked frozen entree. For a few categories of dry products, such as dry pastas, dry rice products, and dry regular coffee and tea, that have relatively uniform composition, the reference amount is proposed for both dry and prepared forms of the food. The proposed reference amount for the dry form is based on the amount needed to prepare the reference amount for the prepared form (Ref. 2). To convert the amount as consumed to the amount in dry form, FDA used the percent yield reported in "Food Yield Summarized by Different Stages of Preparation" published by USDA (Ref. 18) and other pertinent information (e.g., manufacturer's directions). However, in general, dry mixes and concentrated products such as cake mixes, dry beverage mixes, and frozen concentrated fruit juices are not listed.

Other unprepared forms of products (e.g., fresh pastas, fresh or frozen doughs, and batters), imitation or substitute food, altered food (e.g., "low sodium"), foods for special dietary use, and most products containing two or more foods having individual reference amounts, are also not listed in § 101.12(b). The next three sections of this preamble discuss reference amounts for these types of products.

In determining the reference amounts for two product categories, FDA deviated from the principles and rules described above.

1. The carbonated beverage category, primarily represented by soft drinks, had a large sample size, and the mean, median, and modal CSS values were consistently 12 fl oz, reflecting the preponderance of soft drink consumption in 12 fl oz containers. However, the modal analysis showed two additional smaller peaks at both 8 and 16 fl oz. FDA is proposing 8 fl oz (240 mL) as the reference amount for the carbonated beverage category based on the following reasons:

FDA is proposing 8 fl oz as the reference amounts for all other beverages including fruit and vegetable juices based on their CSS values and the principles and procedures described in sections IV.D.2. and IV.D.3. of this document. Although food consumption data consistently supported 12 fl oz as the reference amount for the carbonated beverage category, the 12 fl oz value may have been unduly influenced by the wide use of 12 fl oz single-serving containers as indicated by the sales data. Industry data showed that 12 fl oz was the largest single-serving container size sold and represented about 32 percent (45 percent in terms of dollar volume) of the total quantity of all soft drinks sold in the U.S. during the same time period as when the 1987–1988 NFCS was conducted (Ref. 33).

Consumer complaints related to soft drinks focused on the 6 fl oz serving size currently used on these products that results in multiple serving declarations on 12 fl oz cans which are obviously consumed as a single-serving. This concern is addressed by proposed § 101.9(b)(6) which requires that a container containing less than 200 percent of the reference amount be declared as one serving. In addition, several comments, including the IOM report, suggested a uniform serving size for all beverages.

Considering the reference amounts of 8 fl oz for all other beverages, consumer concerns, and several recommendations for a uniform serving size for all beverages, FDA believes that a uniform 8 fl oz reference amount for all beverages would be more reasonable for nutrition labeling purposes. Such a reference amount would help consumers make nutritional comparisons across all beverage categories. Therefore, the agency is proposing 8 fl oz (240 mL) as the reference amount for carbonated beverages.

2. The other reference amount that deviated from the general principles and procedures described in sections IV.D.2. and IV.D.3. of this document is the category of "butter, margarine, oil, and shortening." Of the products included in this category, butter and margarine had the largest sample sizes, but the mean, median, and modal CSS values for these products did not agree. When all three types of CSS values (excluding whipped type) were considered together, 2 teaspoons could be proposed as the reference amount for this category. Two teaspoons would also be consistent with the Canadian serving size which is 1 to 2 teaspoons. However, although sample sizes were much smaller, data on whipped butter, oils, and shortening consistently supported 1 tablespoon as a more reasonable reference amount. Although butter and margarine are also used as spread, all four types of fats and oils are used interchangeably in food preparation. Therefore, a uniform serving size for all four types of fats and oils would be reasonable and would allow nutritional comparisons of different types of fats and oils.

Most products in this category bearing nutrition labeling have been using 1 tablespoon as the serving size. Accordingly, regulatory decisions to date have been based on a 1 tablespoon serving size (Refs. 34 and 35). Serving size suggestions in comments were split between 1 teaspoon by the butter industry and 1 tablespoon by a trade association representing the shortening, edible oil, and margarine industries. Considering the regulatory history, industry practices, and the recommendation by the fats and oils industry, the agency is proposing 1 tablespoon as the reference amount for the category.

FDA solicits comments on the proposed reference amounts, including the two discussed above, and on any product or product categories that should be added to the reference amount list in § 101.12(b). Comments recommending additions to the list should submit information listed in § 101.12(h) to assist the agency to determine the appropriate reference amounts.

5. Reference Amounts for Products Requiring Further Preparation

Products that require further preparation include dry mixes, concentrates, and fresh or frozen pastas, doughs, and batters. Dry mixes and concentrates vary greatly in their ingredients and degree of concentration. An increasing number of other unprepared forms of products, such as fresh or frozen pastas, doughs, and batters, are being introduced into the retail market. Percent yields of these products may vary among products

within the product category, and appropriate yield information is not available. It is, thus, not possible or practical to determine reference amounts for these types of products.

In § 101.12(c) of the 1990 proposal, the agency proposed that the serving or portion of a product that requires cooking or the addition of water or other ingredients be the amount required to prepare one serving of the final product as established by regulation. In § 101.12(c), FDA is reproposing this provision modified to reflect the changes made in this reproposal. Thus, the agency is proposing that the reference amount for a product that requires cooking or the addition of water or other ingredients is that amount required to prepare one reference amount of the final product as established by regulation. For example, FDA proposed the reference amount for pancakes to be 110 g as prepared. For dry pancake mixes, the reference amount would be the amount of the dry mix that is needed to make 110 g of pancake as prepared. If 40 g of pancake mix is needed to make 110 g of prepared pancake, the reference amount for this pancake mix will be 40 g.

6. Reference Amounts for Imitation or Substitute Food, Altered Food, and Foods for Special Dietary Use

Section 101.12 (d) and (e) of the 1990 proposal provided that the serving size of an imitation or substitute food, and an altered version of a food, such as "low calorie" version, must be the same as that of the food for which the imitation or altered food substitutes.

As discussed in section III.A. of the 1990 proposal, and echoed in comments on that proposal, some manufacturers appear to have manipulated the serving sizes of their products so that the per serving content would allow claims such as "low calorie" or "low sodium." To address these concerns, and similar concerns regarding imitation or substitute foods (as defined in § 101.3(e)), in § 101.12 (d) and (e), FDA is reproposing the same provisions for these types of foods, with slight modification to be consistent with this reproposal. Thus, these proposed sections provide that the reference amount for an imitation or substitute food, and for an altered version of the food, must be the same reference amount as that of the regular counterpart food.

Certain foods for special dietary or medical use are exempt from § 101.9 (55 FR 29487) and therefore, they do not have counterparts listed in § 101.12(b). Dietary supplements are subject to proposed § 101.36 *Nutrition labeling of dietary supplements of vitamins and minerals* in FDA's proposal on Mandatory Nutrition Labeling published elsewhere in this issue of the **Federal Register**. Infant formulas and other foods represented for use as the sole item of the diet, and foods represented for use solely under medical supervision to meet nutritional requirements in specific medical conditions, are subject to special labeling requirements, which are set out elsewhere in title 21, chapter I of the Code of Federal Regulations.

A company requested special exemption on serving sizes of products sold only as part of a weight-control program that prescribes a complete meal plan with serving sizes and which are available only to persons enrolled in their program. The agency has studied this request and has tentatively concluded that the serving size requirements that apply to foods intended for weight control or weight reduction that are available in the marketplace should also apply to the products sold only as part of a weight-control program. Reference amounts for these products should be the same as the reference amounts for their regular counterparts. Dual columns of nutrition information, based on both the reference amount and the serving size prescribed by the program, could, however, be useful and educational to the enrollees. Therefore, FDA would not object to such labeling.

7. Reference Amounts for Products Consisting of 2 or More Foods Having Individual Proposed Reference Amounts

There are three types of products currently in the marketplace that consist of two or more distinct foods, each of which has a proposed reference amount. One type usually consists of two distinct foods placed in the same container that are intended to be consumed together. Examples of such products are peanut butter and jelly, cracker and cheese snack packages, and frozen pancakes and syrup. They are sold in single-serving and multi-serving containers. The 1990 proposal did not address this type of product. In § 101.12(f) of this reproposal, FDA is proposing that the reference amount for this type of product is the sum of the reference amounts for the individual foods, as listed in § 101.12(b). For example, the reference amount for peanut butter and jelly would be the weight in g equivalent to the sum of the proposed reference amounts for peanut butter (30 g and for jelly (1 tablespoon).

The second type is meal-type products (e.g., breakfast, lunch, or dinner trays). Meal-type products are usually sold in single-serving containers. In the 1990 proposal, FDA proposed standard serving sizes for these products under the category of "Meal type trays." However, in this reproposal, the agency is not proposing to establish reference amounts for these products. Because of the wide variety and varying sizes of these products, it would be difficult to determine the amount customarily consumed. Instead, in a proposed regulation entitled "Food Labeling: Nutrient Content Claim, General Principles, Petitions, Definition of Terms" published elsewhere in this issue of the **Federal Register**, FDA is proposing a definition for such products and a compliance system that do not require a reference amount for evaluating nutrient content and health claims. Under proposed § 101.9(b)(3), label serving size for meal-type products is the entire content of the package.

Entrees such as spaghetti, macaroni and cheese, burrito, pizza, and sandwich, which are marketed in single-serving and multi-serving containers, are not considered to be meal-type products. The USDA NFCS's used to derive reference amounts proposed in § 101.12(b) contained information on the amount of food consumed per eating occasion for entrees. Following the general principles and procedures described in sections IV.D.2. and IV.D.3. of this document, FDA is proposing two reference amounts for entrees, one for products that can be measured in a cup and one for products that cannot be measured in a cup. Under this proposal, the serving size of entrees that can be measured in a cup, such as spaghetti and macaroni and cheese, will be based on the reference amount for the category of "Mixed Dishes: Measurable with cup." The serving size of entrees that cannot be measured in a cup, such as burrito, pizza, and sandwich, will be based on the reference amount for the category of "Mixed Dishes: Not measurable with cup."

Some frozen entrees are packaged in separate pouches and contain more than one distinct food per package (e.g., rice or pasta with sauce or toppings). The component foods are packaged separately for technical reasons such as differences in required cooking times for the different components and better preservation of the texture and flavor during storage. However, the components from all pouches in a package are consumed as one product, and the serving size of these products will be based on the reference amount for the category of "Mixed Dishes: Measurable with cup."

The third type is products that contain two or more foods that are not

necessarily intended to be consumed together. An example of this type of product is one having multi-compartments, with each compartment containing a different food such as cheese sauce in one compartment and salsa in the other compartment. Another example of this type of product is a variety pack of single-serving products, e.g., a package containing several varieties of single-serving dry instant hot cereals. These products represent different products in individual containers that are placed together and sold as a single product for convenience, for example, to suit the preference of different family members. Because the food in each individual container within the product package represents a unique product, under proposed § 101.9(b)(4), nutrition information for this type of product is to be provided for each product using its own reference amount. A major manufacturer of a variety pack of dry instant hot cereals is currently providing nutrition information on the variety pack in this manner.

E. Procedures for Converting the Reference Amount to Serving Size

In § 101.9(b)(2) of this reproposed regulation, FDA is proposing procedures that manufacturers must follow in converting the reference amounts listed in § 101.12(b) to the serving sizes in common household measures appropriate for their specific products. These procedures will ensure that the conversions are made in a way that will provide consistency in the serving sizes declared for different brands within a product category.

Many comments, including one from a supermarket chain with many years of consumer experience, stated that consumers want to be able to make nutritional comparisons among the same types of products. Consistency in serving size among products within a food category is necessary for making such comparisons.

Many industry comments opposed the fixed standard serving sizes in the 1990 proposal on the basis that standardized serving sizes do not take into consideration the varied shapes and characteristics of different products within a product category. The procedures in proposed § 101.9(b)(2) permit the manufacturer to take these factors into consideration in converting the reference amount to serving size in common household measures.

For the purpose of developing procedures for converting the reference amount to label serving sizes, FDA grouped all multi-serving products into three categories according to the shape and characteristics of products and the way products are usually served. The agency is proposing separate procedures for each category to ensure that the serving size declared on the label is most appropriate for the specific type of product. Single-serving containers have already been discussed in section IV.C. of this document, and thus, they are not included in this discussion. Procedures for nutrition labeling of products containing multi-serving assorted varieties (e.g., assorted candies) and multi-component gift boxes are addressed in the supplementary proposal for Food Labeling; Reference Daily Intakes and Daily Reference Values; Mandatory Status of Nutrition Labeling and Nutrient Content Revision in proposed § 101.9(e)(1) (published elsewhere in this issue of the **Federal Register**) and are not covered by proposed § 101.9(b).

1. Products in Discrete Individual Units

Comments from all sectors stated that nutrition information on products in discrete individual units (e.g., muffin, egg, sliced bread, and most fruits) should be labeled per unit because that is how these foods are customarily eaten and that is the measure that consumers most prefer for nutrition information on these products. Other products that belong in this category include sliced or individually shaped mini pizzas and individually wrapped or packaged products in multi-serving containers. Section 403(r)(1)(A)(i) of the act requires that serving size be declared in common household measure that is appropriate to the food. FDA agrees with the comments that the measure most appropriate for products in discrete units would be the unit itself (i.e., piece).

However, these products come in many different sizes. For example, the size of most sliced breads ranges from 0.5 oz to 1.3 oz per slice, and the size of muffins ranges from 0.4 oz to 6 oz each. If nutrition information for these products is expressed on a single unit basis, there would be no uniformity in serving sizes declared on these products, and consumers would have to compare the nutritional value of a 0.4 oz muffin with that of a 6 oz muffin.

To assure uniformity in the serving size used for different sizes of similar products, FDA is proposing in § 101.9(b)(2)(i) that serving sizes for products that come in discrete units be the number of units that most closely approximates the reference amount in § 101.12(b) applicable to the product. For example, the label serving size for sliced bread weighing 1 oz per slice will be 2 slices because the weight of 2 slices (56 g) most closely approximates the reference amount for breads (55 g).

Under this proposed provision, only products in units that weigh at least 67 percent of the reference amount can use 1 unit as their serving size. If two units of a product each weigh 67 percent of the reference amount, their total weight is 34 percent more than the reference amount. However, one of these units weighs 33 percent less than the reference amount. Thus, one unit more closely approximates the reference amount than 2 units. However, for a product whose units weigh 66 percent of the reference amount per unit, 2 units weigh 32 percent more than the reference amount, while 1 unit weighs 34 percent less than the reference amount. Therefore, the label serving size for a product whose units weigh 66 percent of the reference amount. per unit is 2 units.

To further promote uniformity in the serving sizes declared for these products, FDA is also proposing in § 101.9(b)(2)(i) that all products in discrete individual units that weigh less than 200 percent of the reference amount must declare 1 serving per unit. This upper limit is the same as the upper limit for a single-serving container which is discussed in section IV.C. of this document.

Most of the products in discrete individual units weigh less than 200 percent per unit. As discussed in section IV.C. of this document, the agency is proposing to set the upper limit at "less than 200 percent" of the reference amount for two reasons. First, a unit that weighs 200 percent of the reference amount is by definition 2 servings. Thus it is not a single-serving product. Secondly, there is a significant question as to whether these larger units will be consumed at a single-eating occasion by one individual, considering that the customarily consumed amount is one-half or less than the unit. Thus, the agency believes that it would not be accurate to require that units that weigh 200 percent or more be labeled as one serving.

However, some exceptionally large pieces weigh more than 200 percent of the reference amount. For example, a large muffin may weigh more than 4 oz, which is more than 200 percent of the reference amount for muffins, and many people may eat the whole muffin at a single-eating occasion. Therefore, FDA is proposing to allow the manufacturer to declare one unit as a serving for products that weigh 200 percent or more of the reference amount if the whole unit reasonably can be consumed at a single-eating occasion. As discussed above, the agency is aware that this allowance

creates a potential for misuse by a manufacturer who claims that an unreasonably large unit is a single-serving in order to show a high content of a nutrient such as fiber and calcium. The agency will consider regulatory action on a case-by-case basis for misuse of this allowance.

The determination of the reasonableness of a single-serving should be based on food consumption data under actual conditions of use. Manufacturers should be prepared to provide the agency with the data that supports the single-serving claim upon request. FDA requests comments on the upper limit for single-serving declaration for products in discrete units, and whether it is reasonable to allow the manufacturer to determine the single-serving status above that level.

2. Products in Large Discrete Units That Are Usually Divided for Consumption

Foods in large discrete units such as cake, pie, pizza, melon, and cabbage are usually divided into slices or pieces for consumption. For example, a 2-layer cake may be divided into 12 pieces, or a 9-inch pie may be divided into 8 slices for consumption. FDA believes that the household measure most meaningful for these products is a fraction of the whole unit. In § 101.9(b)(2)(ii), FDA is proposing that the serving size for these products be expressed as the fraction of the whole food, such as 1/12 cake, 1/8 pie, 1/4 pizza, and 1/4 melon, that most closely approximates the reference amount in § 101.12(b). For example, the proposed reference amount for pizza is 140 g. A 1/4 slice of a pizza weighing 21 oz weighs 147 g and a 1/5 slice of this pizza weighs 118 g. The 1/4 slice is closer to the reference amount than the 1/5 slice. Therefore, the serving size for this pizza would be 1/4 pizza.

3. Nondiscrete Bulk Products

In § 101.9(b)(2)(iii), FDA is proposing that the serving size for all products that are not in individual or large discrete units and are packaged in multi-serving containers (e.g., flour, sugar, breakfast cereals with the exception of large biscuit types) be the amount in common household measure most closely approximating the reference amount for the product category. For example, the proposed referenced amount for mayonnaise is 15 g. One tablespoon mayonnaise weighs about 14 g and therefore, the label serving size for mayonnaise will be 1 tablespoon.

F. Declaration of Serving Size on the Product Label

1. Label Statement of Serving Size

FDA proposed in § 101.9(b)(3) of the 1990 proposal to require the declaration of serving size in U.S. units (oz or fl oz), followed by the equivalent metric quantity in parenthesis (with weight expressed in g and volume in mL). In addition, the agency proposed that manufacturers could voluntarily declare, in parenthesis, household measures such as cups, tablespoons, slices and pieces. Section 403(q)(1)(A)(i) of the act requires that serving sizes be expressed in common household measures. FDA stated in the announcement of the public meeting on serving sizes that in light of the variability that is likely in household measures, the agency continues to believe that a parenthetical listing of weight equivalent to the household measure is necessary for compliance reasons. The agency also pointed out that the declaration of metric quantity would promote international harmonization of food labeling, and that consumers would not have to deal with these measures since the label serving sizes would be declared in common household measures.

Most comments that addressed this issue opposed the use of metric units for serving sizes on the basis that few U.S. consumers understand the metric system, and therefore such information would not be useful to consumers. A number of comments opposed using metric units and supported the continued use of U.S. units.

The presentations and discussion at the public meeting on serving sizes also generally did not favor the use of metric units for serving sizes. However, a health professional at the public meeting stated that metric units would be very useful to immigrants, who make up a substantial portion of the population in some parts of the country, because they come from countries where metric units are used. Some presenters at the meeting stated that if household measures are used, some sort of parenthetical weight measure is needed because of the variability in common household measures, e.g., in the size of a bagel.

The IOM report recommended the use of metric units in parenthesis after the household measure. A Canadian government comment also supported the use of metric units in serving sizes. Comments from other foreign sources urged requiring the use of the metric system and stated that to do otherwise would decrease international harmonization and raise non-tariff trade barriers. A few U.S. comments also supported the use of metric units.

FDA acknowledges that many consumers are unlikely to use the metric information. However, the Omnibus Trade and Competitiveness Act of 1988 (Pub. L. 100–418) declared that the metric system is the preferred measurement system for U.S. trade and commerce. Federal agencies are required to use the metric system in procurement, grants, and other business-related activities to the extent economically feasible by the end of fiscal year 1992.

As stated earlier, the agency believes that it needs an additional precise weight statement for compliance purposes because of the variability in weight of different brands in common household units. To comply with the requirements of the Omnibus Trade and Compliance Act and for compliance purposes, the agency is proposing in § 101.9(b)(7) to require that manufacturers provide the equivalent metric quantity, in parentheses, after the common household measure, e.g., 1 cup (28 g). The agency is also proposing to allow manufacturers voluntarily to list the equivalent U.S. measure in parentheses after the metric measure. The agency believes that metric measures on food labels will contribute to educating children, as well as older consumers, about the metric system.

A Canadian government comment supported using metric units rounded to a convenient size when converting from a common household measure to a metric measure (e.g., rounding from an actual weight of 172 g for a slice of pizza to 170 g). If this proposal is adopted, however, metric weight will be used by the agency for compliance purposes, such as in evaluating adjectival descriptors used on the label. Therefore, the metric measure needs to reflect accurately the common household measure, and the agency is not proposing to permit the rounding of the metric measures.

2. Definition of Household Measures

Section 403(q)(1)(A)(i) of the act requires that the serving size be expressed in a common household measure that is appropriate to the food, or if the use of the food is not typically expressed in a serving size, the common household unit of measure that expresses the serving size of the food. Numerous comments also expressed preference for household measures, which were described in terms of familiar units including oz, cup, tablespoon, teaspoon, slice, and piece.

In § 101.9(b)(4) of the 1990 proposal, FDA proposed definitions for several household measures, including teaspoon, tablespoon, cup, fl oz, and oz.

In § 101.9(b)(5) of this reproposal, FDA is proposing the terms "common household measure" and "common household unit" to mean cup, tablespoon, teaspoon, piece, slice, fraction (e.g., ¼ pizza), oz, and other common household equipment used to package food products, such as jar and tray. As in the 1990 proposal, the agency is proposing in § 101.9(b)(5)(iv) 1 teaspoon to mean 5 mL; 1 tablespoon to mean 15 mL; a cup to mean 240 mL; 1 fl oz to mean 30 mL; and 1 oz in weight to mean 28 g.

One comment stated that 1 oz in weight should be defined as 28.35 g to be consistent with the agency policy for declaring the net weight of the package. FDA does not believe that such accuracy is needed for nutrition labeling purposes, or that the small difference (0.35 g) in the g equivalency to 1 oz between the serving size and the net weight statement would present confusion or a regulatory problem. For simplicity, the agency believes that, for nutrition labeling purposes, 28 g is a more desirable g equivalency to 1 oz than 28.35 g. Therefore, the agency is reproposing that 1 oz be defined as 28 g.

3. Rules for Declaring Household Measures

FDA is proposing in § 101.9(b)(5) of this reproposal, several rules for expressing serving size in common household measures. These rules are intended to assure as much uniformity as possible in label serving sizes within a product category. Without such rules, the same quantity of serving size could be expressed in cups by one manufacturer and in tablespoons by another. Also, one manufacturer may choose to use ⅓ cup as the serving and another manufacturer may choose to use ¼ cup for similar quantities of products. To prevent such inconsistencies in serving sizes, the agency is proposing the following rules for expressing serving sizes in common household measures.

a. Whenever possible, cups, tablespoons, or teaspoons must be used. Numerous comments on the 1990 proposal and at the public meeting requested preferential use of these common household measures in expressing serving sizes on food products. For uniformity in expressing these measures, cups should be expressed in ¼ cup increments, tablespoons in whole number of tablespoons for quantities less than ¼ cup but greater than or equal to 1 tablespoon, teaspoons in whole number of teaspoons for quantities less than 1 tablespoon but greater than or equal to 1 teaspoon, and in ¼ teaspoon increments for quantities less than one teaspoon.

b. If cups, tablespoons, or teaspoons are not applicable, units such as piece, slice, tray, jar, and fraction of the whole piece or package, as appropriate, are to be used. These units are the common household measures that are most appropriate for products not measurable by a cup, tablespoon, or teaspoon.

c. If (a) and (b) are not applicable, oz are to be used with an appropriate visual unit of measure such as a dimension of a piece, e.g., 2 oz (56 g) (about 1 inch slice) for unsliced bread. Such an approach will provide the most readily understandable description for consumers. Ounce measurements must be expressed in 0.5 oz increments most closely approximating the reference amount, with rounding indicated by use of the term "about" (e.g., about 2.5 oz). Such increments are necessary to limit the use of fractional numbers such as 2.3 oz. Consumers repeatedly complained about use of fractional numbers. However, use of fractional numbers is necessary to reduce the error in the equivalent oz measure provided. The agency believes that rounding to the nearest half-ounce increments is reasonable and it will also prevent use of unusually accurate fractional numbers (e.g., 2.1 oz) in serving size.

To promote consistency in the use of units, if a manufacturer elects to use abbreviations for units, the following abbreviations should be used: tbsp for tablespoon, tsp for teaspoon, g for gram, mL for milliliter, oz for ounce, and fl oz for fluid ounce.

G. Listing Nutrient Contents Based on 100 Grams, 100 Milliliters, 1 Ounce, or 1 Fluid Ounce

The agency also proposed in § 101.9(b)(6) of the 1990 proposal to allow another separate, additional column of figures to be declared on the nutrition label based on 100 g or 100 mL of the food as packaged or purchased.

Most comments from consumers and health professionals did not directly address this issue, but a few comments from both groups expressed opposition to the additional column of nutrition information, primarily because they felt that the additional information would not be useful to consumers. Several industry comments suggested using a uniform unit of weight/volume (e.g., 1 oz and 1 fl oz or 100 g and 100 mL) for all products, either with or in lieu of serving sizes. The international comments favored the use of metric units and the use of 100 g or 100 mL rather than requiring serving sizes, citing the fact that 100 g or 100 mL is required in nutrition labeling in many other countries and the need for international harmonization. Some comments said that manufacturers should have the choice of using 100 g or 100 mL in agreement with the nutrition labeling guidelines of Codex Alimentarius (Ref. 36).

The notice of a public meeting on serving sizes raised the issue of presenting nutrition information in a second column based on a uniform weight or volume basis such as 100 g or 100 mL. Written comments and discussion of this issue at the public meeting essentially reiterated the same positions as those in the comments on the 1990 proposal. Consumer and nutrition professional organizations did not support the use of metric units or of an additional column of numbers because they felt that the information was unlikely to be useful to consumers and would present too much information on the label. Representatives from the food industry and trade organizations generally also did not support requiring a second column, citing the space limitations on many food labels. A representative of the pizza industry, however, stated that a uniform weight would be useful on products such as pizza because of the lack of uniformity and the many size and weight variations in these types of foods.

On this issue, it is obviously impossible for the agency to be responsive to all positions. After carefully considering the statutory requirement, and in light of the comments from several sectors opposing metric usage, FDA is reproposing in § 101.9(b)(10) to allow manufacturers to list voluntarily a second column of values. Such values may be based on either 100 g or 100 mL or on 1 fl oz or 1 oz in weight. An important consideration in FDA's tentative decision to provide for such information in a unit (oz) is that the measure is familiar to most Americans to facilitate understanding of the information presented in the nutrition label. Allowing manufacturers to use values based on the metric measures, 100 g or 100 mL, is also consistent with the Omnibus Trade and Competitiveness Act of 1988. Values based on the metric unit also will contribute to international harmonization. Although at the present time many manufacturers may not elect to list nutrition information based on metric measures, and not many consumers in the near future may be likely to use the information, these conditions are likely to change as the

U.S. adopts the metric system. Therefore, the agency believes that it is important to provide manufacturers with this option. The agency also believes that the additional column could become an important educational tool for consumers as they become more familiar with the metric system.

The presentation of nutrition information on a uniform weight or volume basis would allow consumers to make nutritional comparisons not only across different brands of the same food but also across all classes of food products. These types of comparisons could be very useful to persons who wish to make healthful food substitutions in their diet.

H. Declaration of Number of Servings per Container

FDA proposed in § 101.9(b)(5) of the 1990 proposal that the number of servings per package or container should be declared in the nearest 0.5 serving (e.g., 2.5 servings, not 2.3 servings; 7 servings not 7.2 servings), with rounding indicated by use of the term "about" (e.g., about 7 servings).

Many consumer comments complained that they did not like to see a fractional number of servings on the product label. The IOM report recommended that the number of servings per container be rounded down to the nearest whole number. Because this recommendation introduces an unacceptably large error to the number of servings declared on the product label, FDA decided not to adopt the IOM recommendation (see section III.A. of this document for FDA's evaluation of the IOM report).

FDA, therefore, is proposing in § 101.9(b)(8) that the number of servings per package or container be declared to the nearest whole or approximate whole number. Manufacturers would be allowed to either declare the approximate serving size in household measure that results in a whole number of serving per package (e.g., serving size: approximately ½ cup; number of servings per container: 10) or to declare the exact serving size in household measures and the approximate number of servings per container (e.g., serving size: ½ cup; number of servings per container: approximately 10).

Several comments stated that regulation of the number of servings per package must be flexible to accommodate products, such as cheese, in random weight packages. Cheese industry representatives stated that for some types of foods, such as cheeses from large wheels cut in random weights, manufacturers would have a problem in declaring number of servings per package. The agency had not previously considered this special problem that relates to random-weight packages. As a means for dealing with it, FDA is proposing in § 101.9(b)(8) a special exception for random weight packages that would allow manufacturers to declare the number of servings per container as "varied" provided the nutrition information is based on the reference amount expressed in oz. The agency is soliciting comments on whether this exception is a reasonable provision for these types of packages, and, if not, what provision should be made for random weight packages.

I. Use of Serving Size to Evaluate Nutrient Content and Health Claims

FDA proposed in § 101.12(f) of the 1990 proposal that for any container with more than one serving, the proposed standard serving size would be used to determine the appropriateness of a nutrient content claim (descriptor) such as "low sodium." For single-serving containers containing 100 percent or less of the standard serving, evaluation of the label claim would be based on the standard serving size. However, for single-serving containers containing more than 100 percent, but 150 or less percent of the standard serving, the claim would be evaluated on the basis of the entire content of the package.

A majority of comments on FDA's proposal supported the proposed basis for evaluation of descriptors. However, many food industry and trade organization comments objected to the proposed evaluation criteria. These comments generally argued that the established serving size, not the package content, should be used to evaluate descriptor claims on all sizes of packages.

Manufacturers pointed out that under the rule proposed in 1990, the same food product that could be labeled as "low sodium" (or a similar adjectival descriptor) on the basis of a standard serving size might not qualify for "low sodium" labeling when packaged in a single-serving container containing between 100 percent and 150 percent of the standard serving size. For example, an 8 fl oz container of skim milk containing 126 milligrams (mg) of sodium would meet the definition of "low sodium," but a 10 fl oz single-serving container of the same milk that contains 158 mg of sodium would not.

In the notice of public meeting, FDA raised the question of whether these differences in the use of descriptors on food products would be confusing and asked for data to support any views presented. No data on this issue were presented at the meeting. FDA also suggested two alternative solutions to the concerns expressed about use of label descriptors on single-serving containers: (1) To label single-serving containers that do not contain the standard serving with the nutritional content in both the total container and in the standard serving and to permit descriptor use based on the standard serving; or (2) to provide a weight factor on the label that consumers could use to determine the nutritional values based on a standard serving size (e.g., multiply by ⅔ for a single-serving that contains 150 percent of the established serving size). Comments generally offered little support, or opposed, such additional information on the nutrition label. The general sense of the comments was that most consumers would not understand or use this additional information, and that it would contribute to label overload and confusion.

A manufacturer suggested, as resolution for the issue, that FDA establish reference serving sizes, and that both the reference serving size and the serving size declared on the product label be required to be used to evaluate the compliance with FDA criteria for the descriptors. The agency believes that this suggestion represents a reasonable approach to regulating the use of nutrient content and health claims not only on single-serving containers but also all other products when the serving size declared on the label differs from the reference amount (e.g., products in discrete units). Therefore, FDA is proposing in § 101.12(g) that if the serving size declared on the product label differs from the reference amount, the amount of the nutrient or substance in both the reference amount listed in § 101.12(b) and the serving size declared on the product label must meet the FDA criteria for nutrient content and health claims, as set forth in regulations relating to such claims, for the food to qualify for the claim.

The agency recognizes that the proposed approach could result in differences in claims made on the same product depending on the package or unit size. For example, a product which contains the same or less than the reference amount may bear a claim such as "low sodium," whereas a single-serving container of the same product that contains one and a half times the reference amount may not. As mentioned earlier, many industry comments opposed such differences. The agency considered using the reference amount to evaluate whether a label claim meets the criteria for the

claim. Industry generally supported this option. This option will allow the same product to bear the same claim regardless of the package or unit size. However, it also presents major problems.

If the label serving size of the product differs from the reference amount, and the product does not meet the criteria for the claim per serving, it would require an additional statement on the label such as "this package content does not meet the FDA standard for the claim," to inform consumers properly. Such an additional statement would make the label more complicated. Considering other additional label information required by the act, e.g., disclaimers, many products, particularly small single-serving containers, would not have enough space for all of the additional information. Also, such an additional statement is likely to be ineffective if it is present all the time. Furthermore, a product that contains an undesirably large amount of a nutrient from the public health standpoint could bear a claim for which it is qualified only on the basis of the reference amount. For example, based on the reference amount, a product could qualify for use of a "low sodium" claim, which is defined by FDA as 140 mg or less per serving. The same product in a large single-serving container could contain more than 140 mg of sodium and would not qualify but would still be able to bear the "low sodium" claim. This result would be misleading and undesirable from the public health standpoint. Therefore, FDA decided not to adopt this option. The agency solicits comments on this option and on the approach it has chosen to evaluate nutrient content and health claims on food labels.

J. Other Related Issues

1. Nutrition Information on an as Packaged Versus an as Consumed Basis

In § 101.9(b)(6) of the 1990 proposal, FDA proposed that nutrient and food component quantities be declared on the basis of the food as packaged or purchased. Some comments stated that the declaration should be based on the food as consumed.

Many products come in a form (e.g., dry mixes and concentrates) that requires further preparation or an addition of other ingredients before consumption. In many cases, the nutrient content of these products as consumed differs from the nutrient content as packaged. The agency recognizes that consumers will benefit from the nutrition information on an as consumed (prepared) basis since this information reflects the nutrient content of the product actually consumed. Manufacturers usually provide directions for preparation on the package. These directions could be used as a compliance tool for regulating products on an as consumed basis if there is only one direction for preparation and that is the only preparation method that consumers use. Some manufacturers, however, provide multiple directions for preparation (e.g., using different types of fats such as butter and margarine) and different directions often yield different nutrient contents following the preparation. There is no obvious basis for selecting a particular direction for regulatory purpose such as for use in providing nutrition information and for evaluating label claims. Furthermore, a product may be used by consumers in many different ways and the agency has no control over how a product is used after purchase. Consequently, FDA cannot effectively regulate products on an as consumed basis. Therefore, FDA is maintaining the "as packaged or purchased" requirement redesignated as § 101.9(b)(9), with the exception of raw fish covered under § 101.42 and canned fish, canned maraschino cherries, pickled fruits, olives, and canned or pickled vegetables. The serving size for raw fish is discussed in a separate rulemaking concerning voluntary nutrition labeling of raw fruit, vegetables, and fish that is published elsewhere in this issue of the Federal Register. For purposes of the voluntary nutrition labeling program; the agency has defined "raw fish" as fish in the natural state that have received minimal or no processing (56 FR 30468 at 30470). This definition includes "whole or filleted fish that are fresh (unpackaged or packaged by the retailer), fresh frozen (unpackaged or packaged by the retailer), or alive in the retail store (e.g., lobster, crab); shrimp that have been shelled and deveined; and lobster, crab, and shrimp that have been thermally processed or shelled, but not otherwise processed or prepared. (56 FR 30468 at 30470). Other forms of fish, such as packaged frozen fillets, are not included in the proposed exemption in § 101.9(b)(9).

Some foods such as canned fish, canned maraschino cherries, pickled fruits, olives, and canned or pickled vegetables, are usually packed in water, brine, or oil, but the liquid is usually discarded before consumption. Therefore, the nutrient content of these foods as consumed may differ from the nutrient content as packaged. FDA believes that the label serving size most meaningful for these products would be the serving size based on the drained solids. Proposed § 101.9(b)(9) exempts these foods from the requirement for nutrition information on an as packaged basis. Nutrition information for these products will be based on the drained solids. Reference amounts for these products are based on the drained solids as customarily consumed, as noted in the footnote to table 2.

For the benefit of the consumers who follow the package directions in preparing these products, the agency encourages manufacturers voluntarily to provide nutrient content of their products on an as consumed basis using the package directions for preparation and in the case of multiple directions, using the direction that most likely represents the major usage of the product.

Section 101.9(d)(2) of the proposed nutrition labeling regulation (55 FR 29487) provides for the use of an additional column of figures to declare nutrition information on the basis of food as consumed, e.g., cereal with milk or cake mix prepared according to instructions.

2. Flexibility in Serving Size Declared on the Product Label

Some industry comments on the 1990 proposal expressed the need for greater flexibility in serving sizes because of differences, for example, in package sizes and differences in size between pieces within packages. In the notice of public meeting, the agency raised the issue of whether deviation from the standard serving size should be allowed and, if allowed, how much.

A consumer representative at the public meeting stated that FDA should allow some deviation in serving size within a product category, but that it should be minimal and should result in a size close to the amount customarily consumed to protect consumers from both economic deception and misrepresentation of nutrition and health claims. Another consumer representative stated that there is no reason to allow deviation, except for foods like pizza and pies. An industry representative stated that a manufacturer must be permitted deviation from a uniform serving size when a feature of a food distinguishes it, so that a different serving size that more accurately reflects the amount that is customarily consumed may be used, e.g., a prewrapped slice of cheese would be the amount that is customarily consumed. However, the agency has not received any data on what might be a feasible deviation for various food

categories if such deviations were allowed.

The agency agrees that it should provide some flexibility for the serving size declared on the product label to account for differences in package sizes and differences in size between pieces within packages. However, under the act, the serving size declared on the product label must at least approximate the amount customarily consumed, i.e., the reference amount established for the product category. The agency believes that the procedures for converting the reference amount to serving size for use on the product label proposed in § 101.9(b)(2) of this reproposal provide sufficient flexibility to account for the varied characteristics of different products while assuring a relative uniformity of serving sizes used for different brands within a product category.

3. Range Versus Fixed Reference Amount

The Minister of Health and Welfare of Canada submitted as comments Canada's guidelines to the food industry on serving sizes. The Canadian guidelines allow declaration of serving sizes within established ranges, e.g., 40 to 100 g for a muffin and 200 to 250 mL for milk.

FDA is proposing to establish specific reference amounts for 131 product categories, not ranges of values. As mentioned earlier, the reference amounts, if adopted, will serve two purposes: (1) They will be used by manufacturers in determining serving size for their specific products, and (2) they will be used in determining whether food products meet the definitions for nutrient content and health claims. Both of these purposes require a specific reference amount, not a range of values. Therefore, FDA is not proposing to adopt the Canadian approach of using a range.

In addition, it is difficult to determine an appropriate range value for each product category to cover all of the different shapes and varied characteristics of products within each category. FDA also does not know whether any set range would be appropriate for products that will enter the market in the future. FDA believes that the procedures in proposed § 101.9(b)(2) for converting the reference amounts to serving sizes provide the flexibility necessary to deal with diverse shapes and characteristics of specific products. Therefore, FDA has tentatively concluded that ranges are not needed. Furthermore, the procedures that FDA is proposing can be applied to any products that enter the market as well as to those currently in the market.

K. The Petition Process

In § 101.12(g) of the 1990 proposal, FDA proposed to establish a petition process for manufacturers to use to add to or amend a standard serving size. Provision for a petition process was supported by the IOM report and by comments on the 1990 proposal, as well as by comments to the notice of the public meeting on serving sizes. In § 101.12(h), FDA is proposing an updated petition process for manufacturers to use to add to or amend a reference amount listed in § 101.12(b) or to establish a new subcategory if a reference amount for a product category does not apply to a particular product. Section 101.12(h) describes information needed by FDA to evaluate a need for the change or addition requested in the petition and to determine the appropriate reference amount for the petitioned food if the change or addition is judged to be needed.

As discussed earlier, a few manufacturers submitted supporting data with their request for changes in standard serving sizes in the 1990 proposal. However, these data could not be used in developing the reference amounts in this reproposal because of problems in the methodology used to collect or to process data (see the introduction to section IV.D. of this document). To help guide manufacturers in conducting research to collect or process food consumption data to determine the suggested reference amount in support of a petition, FDA is providing the following general guidelines:

1. Sampled population should be representative of the demographic and socio-economic characteristics of the relevant population group (i.e., infants, toddlers, or people 4 or more years of age) for which the food is intended.

2. Sample size (i.e., number of eaters) should be large enough to give a reliable estimate of the amount of food that is customarily consumed.

3. The study protocol should identify potential biases and describe how these potential biases are controlled for, or, if they cannot be controlled for, how they will affect interpretation of results. For example, a survey that asks the participants to measure the amount of food that they usually consume or serve per eating occasion is likely to be biased by downsizing a food having a negative nutritional connotation (e.g., high fat, high calorie foods) and upsizing for foods with positive connotations.

4. Methodology used to collect or process data, including study design, sampling procedures, materials used (e.g., questionnaire, interviewer's manual), procedures used to collect or process data, methods or procedures used to control for unbiased estimates, and procedures used to correct for nonresponse, should be fully documented.

V. Other Affected Rules

In the 1990 proposal, the agency proposed to revise 21 CFR 101.8(a) to provide that where nutrition information is required, and firms elect to place statements on product labels concerning the number of servings in a package in other locations in addition to the location where nutrition information is placed, such statements must be in the same terms as used for nutrition information. FDA proposed this revision to prevent consumer confusion over serving size. For completeness, FDA is once again including § 101.8(a) as part of this reproposal on serving size regulations.

VI. Environmental Impact

The agency has determined under 21 CFR 25.24 that this proposed rule is of a type that does not individually or cumulatively have a significant effect on the human environment. Therefore, neither an environmental assessment nor an environmental impact statement is required. The proposed requirements pertaining to serving sizes to be used on food labels qualify for a categorical exclusion under 21 CFR 25.24(a)(11), and the proposed requirements pertaining to petitions that seek to establish or amend a reference amount qualify for exclusion under 21 CFR 25.24(a)(8).

VII. Economic Impact

The food labeling reform initiative, taken as a whole, will have associated costs in excess of the $100 million threshold that defines a major rule. Therefore, in accordance with Executive Order 12291 and the Regulatory Flexibility Act (Pub. L. 96-354), FDA has developed one comprehensive regulatory impact analysis (RIA) that presents the costs and benefits of all of the food labeling provisions taken together. The RIA is published elsewhere in this issue of the **Federal Register**. The agency requests comments on the RIA.

VIII. Effective Date

In the 1990 proposal, FDA proposed to make the serving size regulation effective 1 year after the publication of a final rule. FDA requested comment on this deviation from the agency's normal practice of making food labeling

regulations effective on the uniform compliance date that follows publication of the final rule. The agency is proposing that any final rule that may be issued based upon this proposal become effective 6 months following its publication in the Federal Register.

FDA notes, however, that in section 10(a)(3)(B) of the 1990 amendments, Congress provides that if the Secretary of Health and Human Services (the Secretary), and by delegation FDA, finds that requiring compliance with section 403(q) of the act, on mandatory nutrition labeling, or with 403(r)(2) of the act, on nutrient content claims, 6 months after publication of the final rules in the Federal Register would cause undue economic hardship, the Secretary may delay the application of these sections for no more than 1 year. In light of the agency's tentative findings in its regulatory impact analysis that compliance with the 1990 amendments by May 8, 1993, will cost $1.5 billion, and that 6 month and 1 year extensions of that compliance date will result in savings that arguably outweigh the lost benefits, FDA believes that the question of whether it can and should provide for an extension of the effective date of sections 403(q) and (r)(2) of the act is squarely raised.

FDA has carefully studied the language of section 10(a)(3)(B) of the 1990 amendments and sees a number of questions that need to be addressed. The first question is the meaning of "undue economic hardship." FDA recognizes that the costs of compliance with the new law are high, but those costs derive in large measure from the great number of labels and firms involved. The agency questions whether the costs reflected in the aggregate number represent "undue economic hardship." Therefore, FDA requests comments on how it should assess "undue economic hardship." Should it assess this question on a firm-by-firm basis, as was provided in the bill that passed the House Committee on Energy and Commerce (H. Rept. 101–538, 101st Cong., 2d sess., 24 (1990)), an industry-by-industry basis, or should it assess this question on an aggregate basis? If the agency should take the latter approach, comments should provide evidence that would permit the agency to make a determination that there is "undue economic hardship" for most companies. FDA also points out that assessing hardship on a firm-by-firm basis would likely be extremely burdensome because of the likely number of requests.

FDA will consider the question of the meaning and appropriate application of section 10(a)(3)(B) of the 1990 amendments as soon as possible after the comment period closes. The agency intends to publish a notice in advance of any final rule announcing how it will implement this section to assist firms in planning how they will comply with the act. The early publication of this notice is to assist firms in avoiding any unnecessary expenses that could be incurred by trying to comply with a compliance date that may cause "undue economic hardship."

IX. Comments

Interested persons may, on or before February 25,1992, submit to the Dockets Management Branch (address above), written comments regarding this proposal. Two copies of any comments are to be submitted, except that individuals may submit one copy. Comments are to be identified with the docket number found in brackets in the heading of this document. Received comments may be seen in the office above between 9 a.m. and 4 p.m., Monday through Friday.

X. Paperwork Reduction Act

In accordance with the Paperwork Reduction Act of 1980 (44 U.S.C. chapter 35), the provisions of § 101.12(h) relating to submission of petitions to FDA will be submitted for approval to the Office of Management and Budget (OMB). These provisions will not be effective until FDA obtains OMB approval. FDA will give notice of OMB approval of these requirements in the Federal Register as part of any final rule that is based on this proposal.

List of Subjects in 21 Part 101

Food labeling, Reporting and recordkeeping requirements.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, it is proposed that 21 CFR part 101 be amended as follows:

PART 101—FOOD LABELING

1. The authority citation for 21 CFR part 101 continues to read as follows:

Authority: Secs. 4, 5, 6 of the Fair Packaging and Labeling Act (15 U.S.C. 1453, 1454, 1455); secs. 201, 301, 402, 403, 409, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 331, 342, 343, 348, 371).

2. Section 101.8 is amended by revising paragraph (a) to read as follows:

§ 101.8 Labeling of food with number of servings.

(a) The label of any package of a food that bears a representation as to the number of servings contained in such package shall bear in immediate conjunction with such statement, and in the same size type as is used for such statement, a statement of the net quantity (in terms of weight, measure, or numerical count) of each such serving; however, such statement may be expressed in terms that differ from the terms used in the required statement of net quantity of contents (for example cups, tablespoons) when such differing term is common to cookery and describes a constant quantity. Such statement may not be misleading in any particular. Where nutrition labeling information is required in accordance with the provisions of § 101.9, however, the statement of the net quantity of each serving shall be consistent with the requirements for serving size expression set forth in that section (e.g., 10 1-cup (240 milliliters) servings). A statement of the number of units in a package is not in itself a statement of the number of servings.

* * * * *

3. Section 101.9 is amended by revising paragraph (b) to read as follows:

§ 101.9 Nutrition labeling of food.

* * * * *

(b) All nutrient and food component quantities shall be declared in relation to a serving or, where the food is customarily not consumed directly, to a portion, as defined in this section.

(1) The term "serving" or "serving size" means an amount of food customarily consumed per eating occasion by persons 4 years of age or older which is expressed in a common household measure that is appropriate to the food. When the food is specially formulated or processed for use by infants or by toddlers, a serving or serving size means an amount of food customarily consumed per eating occasion by infants up to 12 months of age or by children 1 through 3 years of age. The term "portion" means an amount of a food that is not typically expressed in a serving size, i.e., a food customarily used only as an ingredient in the preparation of other foods, (e.g., ¼ cup flour or ¼ cup tomato sauce).

(2) Except as provided in paragraphs (b)(3) and (b)(4) of this section, serving (portion) size declared on a product label shall be determined from the "Reference Amounts Customarily Consumed Per Eating Occasion" (reference amounts) that appear in § 101.12(b) using the following procedures:

(i) For products in discrete units (e.g., muffin, sliced bread, apple), serving size shall be the number of units that most closely approximates the reference amount for the product category. If a unit weighs 67 percent or more, but less than 200 percent of the reference amount, serving size shall be one unit. If a unit weighs 200 percent or more of the reference amount, the manufacturer may declare the whole unit as one serving if the whole unit can reasonably be consumed at a single-eating occasion.

(ii) For products in large discrete units that are usually divided for consumption (e.g., cake, pie, pizza, melon, cabbage), the serving (portion) size shall be the fractional slice of the food (e.g., 1/12 cake, ⅛ pie, ¼ pizza, ¼ melon, ⅛ cabbage) that most closely approximates the reference amount for the product category.

(iii) For nondiscrete bulk products (e.g., breakfast cereal, flour, sugar), serving (portion) size shall be the amount in household measure that most closely approximates the reference amount for the product category.

(3) Serving size for meal-type products as defined in proposed § 101.13(1) of this chapter shall be the entire content (edible portion only) of the package.

(4) A variety pack such as a package containing several varieties of single-serving packages and a product having two or more compartments with each compartment containing a different food shall provide nutrition information for each variety or food per serving size that is derived from the reference amount in § 101.12(b) applicable for each variety or food.

(5) For labeling purposes, the term "common household measure" or "common household unit" means cup, tablespoon, teaspoon, piece, slice, fraction (e.g., ¼ pizza), ounce (oz), or other common household equipment used to package food products (e.g., jar, tray). In expressing serving (portion) size in household measures, the following rules shall be used:

(i) Cups, tablespoons, or teaspoons shall be used wherever possible and appropriate. Cups shall be expressed in ¼ cup increments, tablespoons in whole number of tablespoons for quantities less than ¼ cup but greater than or equal to 1 tablespoon, and teaspoons in

whole number of teaspoons for quantities less than 1 tablespoon but greater than or equal to 1 teaspoon and in ¼ teaspoon increments for quantities less than 1 teaspoon.

(ii) If cups, tablespoons or teaspoons are not applicable, units such as piece, slice, tray, jar, and fraction shall be used.

(iii) If paragraphs (b)(5)(i) and (b)(5)(ii) of this section are not applicable, oz may be used with an appropriate visual unit of measure such as a dimension of a piece, e.g., 2 oz (56 g) (about 1 inch slice) for unsliced bread. Ounce measurements shall be expressed in 0.5 oz increments most closely approximating the reference amount, with rounding indicated by use of the term "about" (e.g., about 2.5 oz).

(iv) For nutrition labeling purposes, a teaspoon means 5 milliliters (mL); a tablespoon means 15 mL; a cup means 240 mL; 1 fluid ounce (fl oz) means 30 mL; and 1 oz in weight means 28 g.

(6) A product that is packaged or sold individually and that contains less than 200 percent of the applicable reference amount shall be considered to be a single-serving, and the entire content of the product shall be labeled as one serving. Small packages sold individually that contain 200 percent or more of the applicable reference amount may be labeled as a single-serving if the entire content of the package can reasonably be consumed at a single-eating occasion.

(7) A label statement regarding a serving (portion) shall be the serving (portion) size expressed in common household measures as set forth in paragraphs (b) (2) through (b)(6) of this section and shall be followed by the equivalent metric quantity in parenthesis (fluids in mL and all other foods in g). In addition, serving (portion) size may be declared in oz and fl oz, in parenthesis, following the metric measure where other common household measures are used as the primary unit for serving (portion) size, e.g., 1 cup (28 g) (1 oz). If a manufacturer elects to use abbreviations for units, the following abbreviations shall be used: tbsp for tablespoon, tsp for teaspoon, g for gram, mL for milliliter, oz for ounce, and fl oz for fluid ounce.

(8) In declaring the number of servings per container, a manufacturer may use either of the two options listed below, choosing the one most meaningful for a specific product. In either case, whole numbers must be used with the exception of random weight products. For random weight products, a manufacturer may declare "varied" for the number of servings per container provided the nutrition information is based on the reference amount expressed in oz.

(i) Declare serving (portion) size as the approximate whole household measure that results in a whole number of servings in the container (e.g., serving size: approximately ½ cup; number of servings per container: 10) or

(ii) Declare serving (portion) size in exact household measure and approximate the number of servings per container (e.g., serving size: ½ cup; number of servings per container: approximately 10).

(9) The declaration of nutrient and food component content shall be on the basis of food as packaged or purchased with the exception of raw fish covered under § 101.42 and foods that are packed or canned in water, brine, or oil but the liquid is not customarily consumed such as canned fish, maraschino cherries, pickled fruits, olives, and canned or pickled vegetables. Declaration of nutrient and food component content of raw fish shall follow the provisions in § 101.45. Declaration of nutrient and food component content of foods that are packed in liquid but the liquid is not customarily consumed, shall be based on the drained solids.

(10) Another column of figures may be used to declare the nutrient and food component information on the basis of 100 g or 100 mL or of 1 oz or 1 fl oz of the food as packaged or purchased, in the same format as required by paragraph (c) of this section.

(11) If a product is promoted on the label, labeling, or advertising for a use that differs in quantity by twofold or greater from the use upon which the reference amount in § 101.12(b) was based (e.g., liquid cream substitutes promoted for use with breakfast cereals), the manufacturer shall provide a second column of nutrition information based on the amount customarily consumed in the promoted use, in addition to the nutrition information per serving derived from the reference amount in § 101.12(b).

* * * * *

4. Section 101.12 is added to read as follows:

§ 101.12 Reference amounts customarily consumed per eating occasion.

(a) The general principles and factors that FDA considered in arriving at the reference amounts customarily consumed per eating occasion (reference amounts) which are set forth in paragraph (b) of this section, are that:

(1) FDA calculated the reference amounts for persons 4 years of age or older to reflect the amount of food customarily consumed per eating occasion by persons in this population group. These reference amounts are based on data set forth in appropriate national food consumption surveys.

(2) FDA calculated the reference amounts for an infant or child under 4 years of age to reflect the amount of food customarily consumed per eating occasion by infants up to 12 months of age or by children 1 through 3 years of age, respectively. These reference amounts are based on data set forth in appropriate national food consumption surveys. Such reference amounts are to be used only when the food is specially formulated or processed for use by an infant or by a child under 4 years of age.

(3) An appropriate national food consumption survey must include a large sample size representative of the demographic and socioeconomic characteristics of the relevant population group and must be based on consumption data under actual conditions of use.

(4) To determine the amount of food customarily consumed per eating occasion, FDA considered the mean, median, and mode of the consumed amount per eating occasion.

(5) When survey data were insufficient, FDA took various other sources of information on serving (portion) sizes of food into consideration. These other sources of information included:

(i) Serving sizes used in dietary guidance recommendations or recommended by other authoritative systems or organizations;

(ii) Serving sizes recommended in comments;

(iii) Serving sizes used by manufacturers and grocers; and

(iv) Serving sizes used by other countries.

(6) Because they reflect the amount customarily consumed, the reference amount and, in turn, the serving size declared on the product label are based on only the edible portion of food, and not bone, seed, shell, or other inedible components.

(7) The reference amount is based on the major intended use of the food (e.g., milk as a beverage and not as an addition to cereal).

(8) The reference amounts for products that are consumed as an ingredient of other foods, but that may also be consumed in the form in which they are purchased (e.g., butter), are based on use in the form purchased.

(9) FDA sought to ensure that foods that have similar dietary usage, product characteristics, and customarily consumed amounts have a uniform reference amount.

(b) The following reference amounts shall be used as the basis for determining serving sizes for specific products:

TABLE 1.—REFERENCE AMOUNTS CUSTOMARILY CONSUMED PER EATING OCCASION: INFANT AND TODDLER FOODS [1] [2] [3]

Product category	Reference amount
Cereal, dry instant	15 g
Cereal, prepared, ready to serve	110 g
Other cereal and grain products, dry ready-to-eat, e.g. ready-to-eat cereals, cookies, teething biscuits, and toasts.	7 g
Dinner, dessert, fruit, vegetable or soup, dry mix.	15 g
Dinner, dessert, fruit, vegetable or soup, ready-to-serve, junior type.	110 g
Dinner, dessert, fruit, vegetable or soup, ready-to-serve, strained type.	60 g
Dinner, fruit, vegetable, stew or soup for toddlers, ready-to-serve.	170 g
Egg/egg yolk, ready-to-serve	55 g
Juice, all varieties	120 mL

[1] These values represent the amount of food customarily consumed per eating occasion and were primarily derived from the 1977–1978 and the 1987–1988 Nationwide Food Consumption Surveys conducted by the U.S. Department of Agriculture.

[2] Unless otherwise noted in the Reference Amount column, the reference amounts are for the ready-to-serve or almost ready-to-serve form of the product (i.e., heat and serve, brown and serve). If not listed separately, the reference amount for the unprepared form (e.g., dry cereal) is the amount required to make one reference amount of the prepared form.

[3] Manufacturers are required to convert the reference amount to the label serving size in a household measure most appropriate to their specific product using the procedures in 21 CFR 101.9(b).

TABLE 2.—REFERENCE AMOUNTS CUSTOMARILY CONSUMED PER EATING OCCASION: GENERAL FOOD SUPPLY [1] [2] [3]

Product category	Reference amount
Bakery Products:	
Breads (excluding sweet quick type), biscuits, rolls, croissants, bagels, tortillas, soft bread sticks, soft pretzels.	55 g
Breakfast bars and toaster pastries.	55 g
Brownies	40 g
Cake, heavy weight, more than or equal to 10 g per cubic inch.	125 g
Cake, medium weight, more than or equal to 6 g but less than 10 g per cubic inch.	110 g
Cake, light weight, more than or equal to 4 g but less than 6 g per cubic inch, and eclairs.	75 g
Cake, very light weight, less than 4 g per cubic inch.	55 g
Coffee cakes, doughnuts, Danish, sweet rolls, sweet quick type breads, muffins, hushpuppies, cornbread.	55 g
Cookies, sweet crackers, and sandwich type crackers.	30 g
Crackers, all varieties excluding sweet and sandwich type—includes hard bread sticks and ice cream cones *.	15 g
Croutons	7 g
French toast, pancakes.	110 g
Pies, cobblers, turnovers, other pastries.	125 g
Pie crust	⅙ of 8 inch crust. ⅐ of 9 inch crust.
Pizza crust	55 g.
Taco shell	30 g.
Waffles	85 g.
Beverages:	
Carbonated beverages (excluding water), wine cooler.	240 mL
Noncarbonated beverages—see fruits and fruit juices category	
Coffee or tea, regular or flavored without sugar or cream/cream substitute.	240 mL prepared or 2 tbsp ground coffee or 2 tsp dry instant coffee or 2 g dry instant or leaf tea.
Coffee or tea, flavored and sweetened.	Amount to make 240 mL prepared.
Water, all types	240 mL
Cereals and Other Grain Products:	
Breakfast cereals (hot cereal type), hominy grits.	1 cup prepared or 40 g plain dry cereal or 55 g flavored, sweetened cereal*
Breakfast cereals, ready-to-eat (weighing less than 3 oz per cup).	1 cup.
Breakfast cereals, ready-to-eat (weighing more than or equal to 3 oz per cup).	½ cup.
Breakfast cereals, ready-to-eat, not measurable with cup, e.g., biscuit type.	50 g.
Bran or wheat germ	15 g.
Flours or cornmeal	30 g.
Grains, e.g., rice, barley, plain or seasoned.	140 g prepared or 45 g dry.
Pastas, without sauce	140 g prepared or 55 g dry.
Pastas, dry, ready-to-eat, e.g., fried canned chow mein noodles.	25 g
Starch, e.g., cornstarch, potato starch, tapioca, etc.	10 g
Stuffing	100 g
Dairy Products and Substitutes:	
Cheese, cottage	110 g.
Cheese used primarily as ingredients, e.g., dry cottage cheese, ricotta cheese.	55 g.
Cheese, grated hard, e.g., Parmesan, Romano.	5 g.
Cheese, all others except those listed as separate categories—includes cream cheese and cheese spread.	30 g.
Cheese sauce—see sauce category	
Cream or cream substitute, fluid.	15 mL.
Cream or cream substitute, powder.	2 g.
Cream, half & half	30 mL.
Eggnog	120 mL.
Milk, condensed, undiluted.	30 mL.
Milk, evaporated, undiluted.	15 mL.
Milk, milk-based drinks, e.g., instant breakfast, meal replacement, cocoa.	240 mL.
Shakes or shake substitutes, e.g., dairy shake mix, fruit frost mix.	240 mL.
Sour cream	25 g.
Yogurt	225 g.
Desserts:	
Ice cream, ice milk, frozen yogurt, sherbet: all types, bulk and novelties (e.g., bars, sandwiches, cones).	½ cup—includes the volume for coatings and wafers for the novelty type varieties.
Sundae	1 cup.
Custard, gelatin or pudding.	½ cup.
Dessert Toppings and Fillings:	
Cake frosting or icing	35 g.
Other dessert toppings, e.g., fruits, syrups, marshmallow cream, nuts, dairy and non-dairy whipped toppings.	2 tbsp.
Pie fillings	85 g.
Egg and Egg Substitutes:	
Egg mixture, e.g., egg foo yung, scrambled egg, omelet.	110 g.
Eggs (all sizes) *	50 g.
Egg substitutes	An amount to make 1 large (50 g) egg
Fats and Oils:	
Butter, margarine, oil, shortening.	1 tbsp.
Butter replacement, powder.	2 g.
Dressings for salad	30 g.

TABLE 2.—REFERENCE AMOUNTS CUSTOMARILY CONSUMED PER EATING OCCASION: GENERAL FOOD SUPPLY [1 2 3] Continued

Product category	Reference amount
Mayonnaise, sandwich spread, mayonnaise-type dressing.	15 g.
Spray type	0.25 g.
Fish, Shellfish, and Meat or Poultry Substitutes:	
Bacon substitute, canned anchovy,[5] anchovy paste, caviar.	15 g.
Dried, e.g., jerky	30 g.
Entrees (cooked) with sauce, e.g., fish with cream sauce, shrimp with lobster sauce.	140 g.
Entrees (cooked) without sauce, e.g., plain or fried fish and shellfish, fish and shellfish cake.	85 g.
Fish and shellfish, canned [5].	85 g.
Substitute for luncheon meat, sandwich spread, Canadian bacon, sausage and frankfurter.	55 g.
Smoked or pickled fish[5] or shellfish.	55 g.
Substitutes for bacon bits—see miscellaneous category	
Fruits and Fruit Juice:	
Candied or pickled[5]	30 g.
Dehydrated fruits—see snacks category	
Dried	40 g.
Fruit for garnish or flavor, e.g., maraschino cherries[5].	4 g.
Fruit relishes, e.g., cranberry sauce, cranberry relish.	70 g.
Fruits used primarily as ingredients e.g., avocado, cranberries, lemon, lime.	55 g.
Watermelon	280 g.
All other fruits (except those listed as separate categories), fresh, canned or frozen.	140 g.
Juice, nectar, fruit drinks, or fruit-flavored drinks.	240 mL.
Juice used as ingredients, e.g., lemon juice, lime juice.	5 mL.
Legumes:	
Bean cake (tofu) [5]	85 g.
Beans, plain [5] or in sauce.	½ cup.
Miscellaneous category:	
Baking powder, baking soda, pectin.	1 g.
Baking decorations, e.g., colored sugars and sprinkles for cookies, cake decorations.	1 tsp or 4 g if not measurable by teaspoon.
Batter mixes, bread crumbs, meat, poultry, and fish coating mixes, dry.	30 g.
Cooking wine	30 mL.
Drink Mixers (without alcohol).	Amount to make 240 mL drink (without ice).
Gum	3 g.
Salad and potato toppers, e.g., salad crunchies, salad crispins, substitutes for bacon bits.	7 g.
Salt, salt substitute, seasoning salt (e.g., garlic salt).	1 g.
Seasoning mixes dry, e.g., chili seasoning mix, pasta salad seasoning mix.	Amount to make one reference amount of the final dish.
Mixed Dishes:	
Measurable with cup, e.g., casserole, hash, macaroni and cheese, pot pie, spaghetti with sauce, stew, etc.	1 cup.
Not measurable with cup, e.g., burrito, egg roll, enchilada, pizza, pizza roll, quiche, all types of sandwiches.	140 g, add 55 g for products with gravy or sauce topping, e.g., enchilada with cheese sauce, crepe with white sauce.[6]
Nuts and Seeds:	
Nuts, seeds and mixtures.	40 g
Nut and seed butter, paste, or cream.	30 g.
Used primarily as ingredient, e.g., coconut, nut and seed flour, etc.	15 g.
Potatoes and Sweet Potatoes/Yams:	
French fries, hash browns, skins, or pancake.	70 g.
Mashed, candied, stuffed, or with sauce.	140 g.
Plain, fresh, canned,[5] or frozen.	110 g.
Salads:	
Pasta or potato salad	140 g.
All other salad, e.g., egg, fish, shellfish, bean, fruit, or vegetable salad.	100 g.
Sauces, Dips, Gravies and Condiments:	
Barbecue sauce, Hollandaise sauce, tartar sauce, other sauces for dipping (e.g., mustard sauce, sweet and sour sauce), all dips (e.g., bean dips, dairy-based dips, salsa), marinade.	2 tbsp.
Major main entree sauce e.g., spaghetti sauce.	½ cup.
Minor main entree sauce (e.g., pizza sauce, pesto sauce), other sauces used as toppings (e.g., gravy, white sauce, cheese sauce), cocktail sauce.	¼ cup.[4]
Major condiments, e.g., catsup, steak sauce, soy sauce, vinegar, teriyaki sauce, etc..	1 tbsp.
Minor condiments, e.g., horseradish, hot sauce, mustard, worcestershire sauce, etc..	1 tsp.
Snacks:	
All varieties, chips, pretzels, popcorns, extruded snacks, fruit-based snacks (e.g., fruit chips), grain-based snack mixes.	30 g.
Soups:	
All varieties	1 cup.
Sugars and Sweets:	
Baking candies (e.g., chips) and hard candies.	15 g.
All other candies	40 g.
Confectioner's sugar	2 tbsp.
Honey, jams, jellies, fruit butter, molasses.	1 tbsp.
Marshmallows	30 g.
Popsicles, snow cones	85 g.
Sugar	8 g.
Sugar substitute	An amount equivalent to one reference amount for sugar in sweetness.
Syrups	60 mL.
Vegetables:	
Vegetables primarily used for garnish or flavor, e.g., pimento, chili pepper, green onion, parsley: fresh or canned [5].	30 g.
All other vegetables without sauce: fresh, canned,[5] or frozen.	85 g.
All other vegetables with sauce: fresh, canned, or frozen.	110 g.
Vegetable juice	240 mL.
Olives [5]	15 g.
Pickles, all types [5]	30 g.
Pickles, relish	15 g.
Vegetable pastes, e.g., tomato paste.	30 g.
Vegetable sauce or puree, e.g., tomato sauce, tomato puree.	60 g.

[1] These values represent the amount (edible portion) of food customarily consumed per eating occasion and were primarily derived from the 1977–1978 and the 1987–1988 Nationwide Food Consumption Surveys conducted by the USDA.

[2] Unless otherwise noted in the Reference Amount column, the reference amounts are for the ready-to-serve or almost ready-to-serve form of the product (i.e., heat and serve, brown and serve). If

not listed separately, the reference amount for the unprepared form (e.g., dry mixes, concentrates, dough, batter, fresh and frozen pasta) is the amount required to make one reference amount of the prepared form.

[3] Manufacturers are required to convert the reference amount to the label serving size in a household measure most appropriate to their specific product using the procedures in 21 CFR 101.9(b).

[4] Label serving size for ice cream cones and eggs of all sizes will be one unit.

[5] Because this product is packed or canned in liquid, and the liquid is not customarily consumed, the reference amount is for the drained solids except for canned cream-style corn and canned or stewed tomatoes. Both the solids and liquid of canned cream-style corn and canned or stewed tomatoes are customarily consumed and therefore, the reference amount for these vegetables will be 130 g (i.e., g weight equivalent to ½ cup).

[6] Pizza sauce is part of the pizza and is not considered to be sauce topping.

(c) The reference amount of a product that requires cooking or the addition of water or other ingredients shall be the amount required to prepare one reference amount of the final product as established in paragraph (b) of this section.

(d) The reference amount for an imitation or substitute food shall be the same as that of the food for which it is offered as a substitute.

(e) The reference amount for an altered version of a food, such as a "low calorie" version, shall be the same as for the food for which it is offered as a substitute.

(f) The reference amount for products that represent two or more foods packaged and presented to be consumed together (e.g., peanut butter and jelly, cracker and cheese pack, pancakes and syrup) shall be the sum of the reference amounts for individual foods in the package.

(g) The reference amount set forth in paragraphs (b) through (f) of this section shall be used in determining whether a product meets the criteria for nutrient content claims, such as "low calorie," and health claims. If the serving size declared on the product label differs from the reference amount, both the reference amount and the serving size declared on the product label shall be used to determine whether the product meets the FDA criteria for a claim.

(h) The Commissioner of Food and Drugs, either on his or her own initiative or on behalf of any interested person who has submitted a petition pursuant to part 10 of this chapter, may issue a proposal to establish or amend a reference amount in § 101.12(b). A petition to establish or amend a reference amount shall include:

(1) Objective of the petition;

(2) A description of the product;

(3) A complete sample product label including nutrition label, using the format established by regulation;

(4) A description of the form (e.g., dry mix, frozen dough) in which the product will be marketed;

(5) The intended dietary uses of the product with the major use identified (e.g., milk as a beverage and chips as a snack);

(6) If the intended use is primarily as an ingredient in other foods, list of foods or food categories in which the product will be used as an ingredient with information on the prioritization of the use;

(7) The population group for which the product will be offered for use (e.g., infants, children under 4 years of age);

(8) The names of the most closely-related products (or in the case of foods for special dietary use and imitation or substitute foods, the names of the products for which they are offered as substitutes);

(9) The suggested reference amount (the amount of edible portion of food as consumed, excluding bone, seed, shell, or other inedible components) for the population group for which the product is intended with full description of the methodology and procedures that were used to determine the suggested reference amount. In determining the reference amount, general principles and factors in paragraph (a) of this section should be followed;

(10) The suggested reference amount shall be expressed in metric units. Reference amounts for fluids shall be expressed in milliliters (mL). Reference amounts for other foods shall be expressed in grams (g) except when common household units such as cups, tablespoons, and teaspoons, are more appropriate or are more likely to promote uniformity in serving (portion) sizes declared on product labels. For example, common household measures would be more appropriate if products within the same category differ substantially in density such as ready-to-eat breakfast cereals and frozen desserts.

(i) In expressing the reference amounts in mL, the following rules shall be followed:

(A) For volumes greater than 30 mL, the volume shall be expressed in multiples of 30 mL.

(B) For volumes less than 30 mL, the volume shall be expressed in mL equivalent to a whole number of teaspoons or one tablespoon, i.e., 5, 10, or 15 mL.

(ii) In expressing the reference amounts in g, the following general rules shall be followed:

(A) For quantities greater than 10 g, the quantity shall be expressed in nearest 5 g increment.

(B) For quantities less than 10 g, exact g weights shall be used.

(11) A petition to create a new subcategory of food with its own reference amount shall include the following additional information:

(i) Data that demonstrate that the new subcategory of food will be consumed in amounts that differ enough from the reference amount for the parent category to warrant a separate reference amount. Data must include sample size; and the mean, median, and modal consumed amount per eating occasion for the petitioned product and for all products in the category, excluding the petitioned product. All data must be derived from the same survey data.

(ii) Documentation supporting the difference in dietary usage and product characteristics that affect the consumption size that distinguishes the petitioned product from the rest of the products in the category.

(12) A claim for categorical exclusion under § 25.24 of this chapter or an environmental assessment under § 25.31 of this chapter; and

(13) In conducting research to collect or process food consumption data in support of the petition, the following general guidelines should be followed.

(i) Sampled population selected should be representative of the demographic and socio-economic characteristics of the target population group for which the food is intended.

(ii) Sample size (i.e., number of eaters) should be large enough to give reliable estimates for customarily consumed amounts.

(iii) The study protocol should identify potential biases and describe how potential biases are controlled for or, if not possible to control, how they affect interpretation of results.

(iv) The methodology used to collect or process data including study design, sampling procedures, materials used (e.g., questionnaire, interviewer's manual), procedures used to collect or process data, methods or procedures used to control for unbiased estimates, and procedures used to correct for nonresponse, should be fully documented.

(14) A statement concerning the feasibility of convening associations, corporations, consumers, and other interested parties to engage in negotiated rulemaking to develop a proposed rule consistent with the Negotiated Rulemaking Act (Pub. L. 101-648).

Dated: November 4, 1991.
David A. Kessler,
Commissioner of Food and Drugs.
Louis W. Sullivan,
Secretary of Health and Human Services.

[Docket No. 91N-0384]

RIN 0905-AD08

Food Labeling: Nutrient Content Claims, General Principles, Petitions, Definition of Terms

AGENCY: Food and Drug Administration, HHS.

ACTION: Proposed rule.

SUMMARY: The Food and Drug Administration (FDA) is proposing: (1) To amend its food labeling regulations to define nutrient content claims and to provide for their use on food labels; (2) to provide definitions for specific nutrient content claims that include the terms "low," "free," "reduced," "light" or "lite," "source," and "high;" (3) to provide for comparative claims using the terms "less," "fewer," and "more;" (4) to set forth specific requirements for sodium and calorie claims; (5) to establish procedures for the submission and review of petitions regarding nutrient content claims; (6) to revise 21 CFR 105.66, which covers special dietary foods with usefulness in reducing or maintaining caloric intake or body weight; (7) to establish criteria for the appropriate use of the term "fresh;" and (8) to address the use of the term "natural". FDA is addressing claims for cholesterol, fat, and fatty acid content in a separate proposal published elsewhere in this issue of the Federal Register. This action is part of the food labeling initiative of the Secretary of the Department of Health and Human Services (the Secretary) and in response to the Nutrition Labeling and Education Act of 1990.

DATES: Written comments by February 25, 1992. The agency is proposing that any final rule that may be issued based on this proposal become effective 6 months following its publication in accordance with the provisions of the Nutrition Labeling and Education Act of 1990.

ADDRESSES: Written comments to the Dockets Management Branch (HFA-305), Food and Drug Administration, rm. 1-23, 12420 Parklawn Dr., Rockville, MD 20857.

FOR FURTHER INFORMATION CONTACT: Elizabeth J. Campbell, Center for Food Safety and Applied Nutrition (HFF-312), Food and Drug Administration, 200 C St. SW., Washington, DC 20204, 202-485-0229.

SUPPLEMENTARY INFORMATION:

I. Background

A. General

FDA has a long history of interest in prescribing label statements concerning the dietary properties of food. As early as 1940 (5 FR 1199, March 28, 1940), FDA held a hearing to discuss what label statements might be used to inform purchasers of the value that a particular food purports to have. Initially, these label statements were concerned with foods that purported or were represented to be for special dietary use by humans. While these statements focused to a large extent, but not exclusively, on vitamins and minerals, the early rulemaking also dealt with control of body weight and the value of food for use in dietary management of disease through controlling the intake of various nutrients.

By 1953 (18 FR 7249, November 14, 1953), FDA had begun to focus on specific nutrients such as sodium. The 1953 notice, for example, announced a hearing on label statements relating to certain foods used as a means of regulating the intake of sodium for the purposes of dietary management with respect to disease. On July 1, 1954 (19 FR 3999), FDA issued a final regulation recognizing that sodium restricted diets were widely used for dietary management of edema associated with some types of heart, liver, and kidney diseases; and that food purporting to be, or represented for, special dietary use in regulating the intake of sodium in dietary management should bear information concerning its sodium content.

In 1973 (38 FR 20708, August 2, 1973), FDA issued a final regulation, which was temporarily stayed and later revised, in part, as § 105.3 (21 CFR 105.3), stating that the term "special dietary use" applied to a food supplying a special dietary need that exists by reason of a physical, physiological, or other condition including convalescence, pregnancy, lactation, infancy, allergic hypersensitivity to food, underweight, overweight, diabetes mellitus, or the need to control the intake of sodium. In 1978, FDA adopted regulations that defined the terms "low" and "reduced" for describing calorie content and set conditions for other label statements on special dietary foods used to reduce or maintain weight or in diabetic diets (43 FR 43278, September 22, 1978).

In the 1980s, FDA changed the focus of nutrient claims from providing guidance for the dietary management of certain diseases to providing information that is useful to the general population. In 1984, the agency adopted regulations (49 FR 15510, April 18, 1984) that defined how the terms "very low," "low," "free," or "reduced" may be used to describe the sodium content of food. In addition, in 1986, the agency proposed to define terms to describe the cholesterol content of foods (51 FR 42584, November 25, 1986).

This change in focus towards defining descriptors is in large part the result of recent scientific developments and recommendations that have emphasized the role of diet in the maintenance of health. For example, the U.S. Department of Agriculture (USDA) and the U.S. Department of Health and Human Services (DHHS) have jointly developed a set of recommendations known as "Dietary Guidelines for Americans" (Ref. 1). These recommendations, which were published in 1980 and revised in 1985 and 1990, are based on the view that the judicious selection of foods containing low or high levels of certain nutrients as part of an overall diet is prudent on the part of all consumers, not just those with special dietary needs.

In addition, two scientific consensus reports, "The Surgeon General's Report on Nutrition and Health" (1988) (Ref. 2) and the National Academy of Sciences' report "Diet and Health: Implications for Reducing Chronic Disease Risk" (1989) (Ref. 3), concluded that changes in current dietary patterns, namely reducing consumption of fat, saturated fatty acids, cholesterol, and sodium and increasing consumption of complex carbohydrates and fiber, could lead to reduced incidence of certain chronic diseases.

In the Federal Register of August 8, 1989 (54 FR 32610), FDA published an advance notice of proposed rulemaking (ANPRM) that announced a major initiative of DHHS to take a new look at food labeling as a tool for promoting sound nutrition for the nation's consumers. FDA asked for public comment on five areas of food labeling, including the use of descriptors such as "low" or "free" to characterize foods.

FDA received over 2,000 written comments in response to this notice, plus over 5,000 responses to a questionnaire that had been distributed by a consumer organization. Over 500 comments addressed issues related to specific descriptors. Four hundred and

fifty addressed the terms "light," "fresh," and "natural." Among those commenting, there was nearly universal agreement that these descriptors should be defined, and that FDA needed to proceed as quickly as possible to develop regulatory definitions for all descriptors that lacked definitions. Approximately 3,500 of the over 5,000 questionnaire responses also supported the need for additional descriptor definitions.

As part of this DHHS food labeling initiative, FDA also held four national public hearings, announced in the **Federal Register** of September 20, 1989 (54 FR 38806), to discuss nutrition labeling and other issues related to food labeling, such as descriptors. Some 200 people, including consumers, health professionals, trade associations and other industry representatives, and state and local health officials, testified at these hearings. In addition, 1,500 more persons participated in 50 local "consumer exchange" meetings conducted by FDA.

The comments revealed a common concern about the unregulated use of descriptors. Many comments stated that the proliferation of undefined terms had resulted in confusion for consumers and unfair competition for manufacturers. One comment stated that the terms were "meaningless in the way they are now used and are primarily used as marketing tools rather than as guides for the health conscious consumer." Food industry representatives requested flexibility in the use of descriptors, not only to allow simple content statements ("Contains X amount of sodium") but also to allow statements of nutrient reductions brought about by technological advances.

Comments also generally supported expanding existing definitions for descriptors to include a number of food components of public health significance such as fats and cholesterol. Although some comments addressed specific descriptive terms to be used on the label, few comments recommended nutrient or food component levels to qualify for descriptors. Some food industry representatives did, however, suggest criteria for "high" and "reduced" claims.

Comments from health professional organizations also supported the need for content claims to take into account the negative aspects of food in addition to the positive aspects, in order to not mislead consumers. Finally, several comments emphasized the need for FDA and USDA to be consistent in their definitions of descriptive terms.

On March 7, 1990, the Secretary, Dr. Louis W. Sullivan, announced that FDA would undertake a comprehensive, phased response to the comments on the ANPRM. In the **Federal Register** of July 19, 1990, FDA published its first set of proposals, including a tentative final rule that defined terms for use to describe the cholesterol content of foods (55 FR 29456) and a proposed rule (55 FR 29487, July 19, 1990) to require nutrition labeling on most foods that are meaningful sources of nutrients (hereinafter referred to as the mandatory nutrition labeling proposal). At the same time, FDA published a proposed rule (55 FR 29476, July 19, 1990) in which the agency updated the U.S. Recommended Daily Allowances (U.S. RDAs) used in food labeling and replaced the term "U.S. RDA" with "Reference Daily Intake" (RDI) (the RDI/DRV proposal). In the same proposal, the agency also introduced the term "Daily Reference Value" (DRV) and proposed DRVs for eight food components: total fat, saturated fatty acids, unsaturated fatty acids, cholesterol, carbohydrate, fiber, sodium, and potassium. These DRVs are based upon a reference diet of 2,350 calories, which is the population adjusted mean of the recommended energy allowances for persons 4 or more years of age (Ref. 4). Together the RDIs and DRVs are referred to as Daily Values. FDA also proposed (55 FR 29517, July 19, 1990) standardized serving sizes for categories of foods to assure reasonable serving sizes and to provide for comparison among similar products. FDA said that these serving sizes, if adopted, would ensure that claims such as "low cholesterol" were the result of the characteristics of the food and not of manipulation of the serving size. The agency stated that these standardized serving sizes will help to ensure that food label claims are not misleading to consumers.

In the fall of 1990, the Institute of Medicine (IOM) of the National Academy of Sciences, issued a report entitled "Nutrition Labeling Issues and Directions for the 1990s" (the IOM report) (Ref. 5). This report addressed, among other things, the use of descriptors on the principal display panel of food labels. The IOM report expressed concern that the unregulated use of these descriptors would nullify the efforts of consumers to make intelligent use of the factual information required on the nutrition label. The IOM report also stated that the absence of definitions for many descriptors would work to the disadvantage of manufacturers who are reluctant to use terms that distort or exaggerate nutritionally unimportant differences.

B. Nutrition Labeling and Education Act of 1990

On November 8, 1990, the President signed into law the Nutrition Labeling and Education Act of 1990 (the 1990 amendments) (Pub. L. 101-535). The 1990 amendments make the most significant changes in food labeling law since the passage of the Federal Food, Drug, and Cosmetic Act of 1938 (the act). They strengthen the Secretary's food labeling initiative by clarifying the Secretary's (and by delegation, FDA,s) legal authority to require nutrition labeling on foods and by defining the circumstances under which claims may be made about the nutrients in foods.

Section 3 of the 1990 amendments among other things, added section 403(r)(1)(A) to the act. This provision states that a food is misbranded if it bears a claim in its label or labeling that either expressly or implicitly characterizes the level of any nutrient of the type required to be declared as part of nutrition labeling, unless such claim has been specifically defined (or otherwise exempted) by regulation.

In this document, FDA is proposing general principles and procedures to govern the use of nutrient content claims. The agency is also proposing definitions for descriptors except as they apply specifically to cholesterol, saturated fat, and total fat content. The use of descriptive terms for these nutrients, and the use of descriptive terms on standardized foods and on butter, is addressed in separate documents published elsewhere in this issue of the **Federal Register.**

In this document, the agency is also proposing procedures by which a person may petition FDA to revise these regulations, to provide for the use of new or similar descriptive terms, or to provide for the use of implied claims in brand names. It is also proposing to address certain descriptive terms that are used for purposes other than making nutrient content claims, namely "fresh," "natural," and "organic." The agency is proposing to define and provide for the proper use of "fresh," "freshly prepared," and "fresh frozen."

C. Organization of Regulations

To facilitate use of its regulations and to provide for the possibility of additional claims regulations, FDA is proposing to add Subpart D—Specific Requirements for Nutrient Content Claims to 21 CFR part 101. In so doing, FDA is proposing to redesignate current § 101.13 *Sodium labeling* as § 101.61 *Nutrient content claims for sodium content of foods* and to add a new

§ 101.13 *Nutrient content claims—general provisions.* This change will result in a more logical organization to the food labeling regulations. In addition, FDA is proposing to redesignate Subpart F as Subpart G and to add a new Subpart F—Specific Requirements for Descriptor Claims that are Neither Nutrient Content Claims nor Health Claims.

In response to section 3(b)(1)(A)(iii) of the 1990 amendments, the agency is organizing this preamble by descriptive term. However, to the extent that existing regulations are already in place or have been previously proposed, the agency is proposing to organize these regulations by nutrient. Claims for "light" or "lite" are codified separately.

II. General Principles for Nutrient Content Claims

A. Legal Basis

FDA is proposing to establish the conditions under which claims may be made about the level of a nutrient in a food (a nutrient content claim). FDA is also proposing to define various terms that may be used to make these claims. FDA, however, does not consider all terms used to describe a food as nutrient content claims. A term may describe some other attribute of a food such as freshness. Such claims would not be subject to requirements for § 101.13 *Nutrient content claims—general provisions.* FDA has authority to take these actions regarding nutrient content claims under sections 201(n), 403(a), 403(r), and 701(a) of the act (21 U.S.C. 321(n), 343(a), 343(r), and 371(a)). Those sections authorize the agency to adopt regulations that prohibit labeling that: (1) Is false or misleading in that it fails to reveal material facts with respect to consequences that may result from use of the food and (2) uses terms to characterize the level of any nutrient in a food that have not been defined by regulation by FDA.

Because the consensus reports cited above suggest that consumers adhere to certain dietary recommendations, and because comments to the 1989 ANPRM and testimony at FDA's public hearings on labeling show that consumers are concerned about, and want to adjust, their dietary intake of certain nutrients but are concerned with confusing and misleading label statements, it is important that these label statements not convey a misleading impression about the content of various nutrients in a food. Without clear definitions of the terms that describe the levels of these nutrients in food, manufacturers could use a term like "high in fiber" on products that vary widely in fiber content.

Inconsistent use of the same term on various products could lead to consumer confusion and nonuniformity in the marketplace. To ensure that consumers are not misled and are given reliable information, Congress found, and FDA agrees, that it is appropriate for the agency to establish specific definitions to standardize the terms used by manufacturers to describe the nutrient content of foods. FDA is proposing to do so in this document.

B. Scope

Under section 403(r)(1)(A) of the act, a claim that characterizes the level of a nutrient of the type required by nutrition labeling that is in a food may only be made in accordance with the regulations that FDA adopts under section 403(r)(2) of the act. FDA is incorporating this provision in proposed § 101.13(b). Among other things, such claims may only be made using terms that FDA has defined by regulation (21 U.S.C. 343(r)(2)(A)(i)) and must be made in conjunction with the appropriate labeling statements (21 U.S.C. 343(r)(2)(B)), unless they are subject to one of the exemptions in the act (21 U.S.C. 343(r)(2)(C), (D), and (E)). The remainder of this preamble and the accompanying proposed regulations fill in the details of these basic statutory requirements.

FDA is proposing in § 101.13 to prescribe the circumstances in which claims that characterize the level of a nutrient in a food may be made on a food label or in labeling (see 21 U.S.C. 343(r)(1)(A) and (r)(2)) In proposed § 101.13(a), FDA, reflecting the introductory language of section 403(r)(1) of the act, states that § 101.13 and the regulations in subpart D of part 101 apply to all foods that are intended for human consumption and that are offered for sale.

The regulation also states the types of claims that are covered. Proposed § 101.13(b), following section 403(r)(1)(A) of the act, limits the use of both express and implied nutrient content claims. The 1990 amendments do not elaborate about what constitutes an expressed or an implied claim. The legislative history, however, specifically the House report on the 1990 amendments (H. Rept. 101–538, 101st Cong., 2d sess. 19 (June 13, 1990)), states that an example of "an expressed claim covered by section 403(r)(1)(A) would be the statement 'low sodium'." Such an expressed claim makes a direct statement about the level of a nutrient, in this case sodium, in a food. Consequently, FDA is proposing in § 101.13(b)(1) that an expressed nutrient content claim is any direct statement about the level (or range) of a nutrient in the food.

The House report also states that an example of an implied claim would be a statement that "implies that the product is low [or high] in some nutrient * * * but does not say so expressly." (*Id.*) The report cites two examples of implied claims: "lite," which according to the report implies that the food is low in some nutrient but does not say so expressly, and " 'high oat bran' which conveys an implied high fiber message." (*Id.*)

Although FDA is proposing a definition of "light" (or "lite") that is somewhat different than that portrayed in the House report, the agency considers that Congress' choice of the "high oat bran" claim as an example of an implied claim is significant. FDA notes that, based on this example, several other claims being used on the food label would constitute implied nutrient claims. For example, such claims as "contains no tropical oils," "contains no palm oil," and "made with 100 percent vegetable oil," convey an implied message that the product is low in, or free of, saturated fat. Therefore, FDA is proposing in § 101.13(b)(2) to define an implied nutrient content claim as any claim that describes the food, or an ingredient therein, in a manner that implies that a nutrient is absent or present in a certain amount or that may be useful to consumers in selecting foods that are helpful in achieving a total diet that conforms to current dietary recommendations (e.g., "healthy"). Significantly, if FDA adopts this definition, under the provisions of the statute, such implied claims would be prohibited until such time as they are defined by FDA by regulation.

FDA recognizes, however, that an argument can be made that statements such as "contains oat bran" are not intended to be nutrient content claims but are intended to advise consumers that oat bran is used as a significant ingredient in the product. Furthermore, a similar argument can be made that a statement that a particular ingredient constitutes 100 percent of the food (e.g., "100 percent corn oil" or "100 percent Columbian coffee) should not be considered an implied nutrient content claim when that statement is the statement of identity for the food. Moreover, FDA recognizes that this provision may raise questions about similar claims such as "contains no preservatives" or "contains no artificial flavors or colors." The agency believes that the latter claims cannot be

characterized as nutrient content claims because they do not relate in any way to nutrients of the type that are addressed in section 403(q) of the act. These claims are more appropriately characterized as ingredient claims. FDA requests comments on how to draw an appropriate line between implied nutrient content claims and ingredient claims.

In addition, because of the large variety of statements that can be considered to make implied claims about the level of a nutrient in a food or the usefulness of a food in achieving a diet that conforms to current dietary recommendations, and because of the resource constraints and strict timeframes under which this rulemaking is proceeding, FDA is not proposing to adopt regulations that authorize any implied claims at this time. However, the agency solicits comments concerning criteria for evaluating whether implied claims are appropriate and not misleading as well as information on specific implied claims.

If FDA receives sufficient information in comments, it will consider providing for specific implied claims in the final regulation. Alternatively, the agency may defer action on implied claims until after the rulemakings required by the 1990 amendments are complete. The agency would then consider individual implied claims through the petition process on a case-by-case basis. In this document, the agency is proposing procedural regulations for petitions on nutrient content claims, including those requesting definition of acceptable implied claims.

In § 101.13(b)(3), FDA is proposing to prohibit the use of nutrient content claims on food products that are specifically intended for infants and toddlers less than 2 years of age. The agency is proposing this prohibition for several reasons. Comments received in response to the 1986 proposal on cholesterol descriptors (51 FR 42584, November 25, 1986) stated that changing the diet of these children toward a more restrictive dietary pattern should await demonstration that such dietary restriction is needed and would support adequate growth and development. The agency agreed with these comments and proposed in the tentative final rule on cholesterol descriptors (55 FR 29456, July 19, 1990) to exclude the use of descriptors and quantitative cholesterol and fatty acid labeling on foods specifically intended for use by infants and toddlers. Furthermore, there is agreement among the American Academy of Pediatrics, the American Heart Association, the National Institutes of Health's Consensus Conference on Lower Blood Cholesterol and the National Cholesterol Education Program that fat and cholesterol should not be restricted in the diets of infants (Ref. 57). Relatively little attention has been given to the role of the pediatric diet in modifying the risk of other chronic diseases found in adults such as hypertension and obesity (Ref. 3). Thus, the agency lacks evidence that a more restrictive dietary pattern for other nutrients such as sodium or an increased intake for nutrients such as fiber are appropriate and recommended for infants and toddlers. Therefore, until the agency has information that such dietary patterns are appropriate for children and support adequate growth and development, FDA is proposing in § 101.13(a) that nutrient content claims may not be made on foods intended specifically for use by infants and toddlers less then 2 years of age.

The act specifically excludes statements that appear as part of nutrition information from the coverage of section 403(r)(1) of the act. This exclusion was included in the 1990 amendments to make it clear that the information required on the nutrition label, and the optional statements that are permitted as a part of nutrition labeling, are not claims under section 403(r)(1) of the act and are not subject to the disclosure requirements in section 403(r)(2) of the act (Congressional Record H5841 (July 30, 1990)). However, the legislative history of this provision specifically states that the identical information will be subject to the descriptor requirements if it is included in a statement in another portion of the label. (*Id.*) Consequently, FDA is proposing in § 101.13(c) that information that is required or permitted by § 101.9 to be declared in nutrition labeling, and that appears as part of the nutrition label, is not a nutrient content claim and is not subject to the requirements of this section. Proposed § 101.13(c) also states, however, that if such information is declared elsewhere on the label or in labeling, it is a nutrient content claim and is subject to the requirements for nutrient content claims.

C. Labeling Mechanics

The 1990 amendments do not include specific limits on the prominence of nutrient content claims. Although FDA recognizes the importance that certain nutrient content claims can have in encouraging sound dietary practices, it also recognizes that individual foods must be evaluated in the context of the total diet. Consequently, it is important not to overemphasize any one aspect of a single food. Therefore, FDA is proposing to require in § 101.13(f) that a nutrient content claim be, in type size and style, no larger than that of the statement of identity. The agency believes that this proposed requirement will ensure that descriptors are not given undue prominence. Under proposed § 101.13(f), descriptors that are a part of a statement of identity can be in the same type size and style as the other words in the statement of identity.

FDA is proposing this requirement under section 403(f) of the act as well as section 403(r) of the act. Section 403(f) of the act states that a food is misbranded if any statement required by or under the authority of the act is not placed on the label with such conspicuousness, as compared to other words, statements, designs, or devices, as to render it likely to be understood by the ordinary consumer. FDA believes that the requirement in proposed § 101.13(f) is necessary to ensure that importance of the information provided by the nutrient content claim, as well as that provided by the statement of identity, is fully understood by consumers. Because these two items will have at least equal prominence on the label or in labeling, the consumer will be able to judge that they both present important information that must be considered in structuring the total diet.

Section 403(r)(2)(B) of the act states that if a nutrient content claim is made, the label or labeling of the food shall contain, prominently and in immediate proximity to such claim, the following statement: "See _____ for nutrition information" (hereinafter referred to as the referral statement). Under section 403(r)(2)(B)(i) of the act, the blank must identify the panel on which the information described in the statement may be found. FDA is incorporating this requirement in proposed § 101.13(g).

Section 403(r)(2)(B) of the act requires that the referral statement must appear prominently, but it does not contain specific prominence requirements such as type size or style. However, section 403(r)(2)(A)(iii) through (v) of the act requires that statements that disclose the level of fat, saturated fat, or cholesterol, which must be presented in conjunction with certain nutrient content claims, "have appropriate prominence which shall be no less than one-half the size of the claim." The agency believes that for consistency, and because the referral statement and the statement disclosing the level of another nutrient must both be in immediate proximity to the claim, and therefore must be adjacent to one another, the type size of these statements should be the same. In

addition, FDA has long held that accompanying information should be in a size reasonably related to that of the information it modifies. This relative prominence, when codified, has been one-half the type size of the information modified (e.g., §§ 101.22(i)(2) and 102.5(b)(2)(ii)).

The agency is proposing one-sixteenth of an inch as the minimum type size for the referral statement. One-sixteenth of an inch is specified in § 101.2(c) as the minimum type size for most other mandatory information on the principal display panel or information panel, e.g., designation of ingredients, name and place of business, nutrition information, and warning and notice statements. Further, one-sixteenth of an inch is the minimum size required in § 101.105(i) for net quantity of contents statements. Consequently, the agency believes that the minimum type size for such information should be one-sixteenth of an inch.

In addition, the agency is proposing that the referral statement be "in easily legible boldface print or type in distinct contrast to other printed or graphic matter." Section 403(r)(2)(B) of the act states that the referral statement for nutrient content claims should be "prominent." In other instances where the act has suggested that information be prominent, FDA has proposed a similar requirement (see, e.g., proposed on percentage labeling of foods purporting to be beverages containing vegetable or fruit juice (56 FR 30452, July 2, 1991)). Therefore, to be consistent with previous actions and to ensure under section 403(f), that the referral statement is presented in a way that makes it likely to be read, FDA is proposing in § 101.13(a)(1) that the referral statement be presented in easily legible boldface print or type.

As stated above, the 1990 amendments require that the referral statement be in immediate proximity to the nutrient content claim. In addition, the related statements required by section 403(r)(2)(A)(iii) through (v) of the act are required to be in immediate proximity to such claims, and no distinction is made as to which statement must be closer to the actual claim. Because the related statements provide more specific information, FDA is proposing that they be presented before the referral statement.

Although there is no specific guidance given as to what constitutes immediate proximity, FDA has traditionally defined immediate proximity as immediately adjacent to, with no intervening material present. Section 101.2(e) of 21 CFR, for example, requires that there be no intervening material among the information that is required to appear on the information panel. By no intervening material, FDA means that there may be no printed matter, either pictorial or character between the two pieces of information. However, a claim may be made immediately preceding, or as part of, the statement of identity. Thus, for purposes of proposed § 101.13(g)(2), when the nutrient content claim immediately precedes or is part of the statement of identity, the statement of identity, or the non-claim part of the statement of identity, will not be considered intervening material. For example, if a product were labeled "Light cupcakes—contain ⅓ fewer calories than our regular cupcakes; see side panel for nutrition information," and no pictorial or written material intervened, the agency would consider that the related statements and the referral statement were in immediate proximity to the nutrient content claim of "light." The term "cupcakes" in this example would not be considered to be intervening material.

Section 3(b)(1)(A)(v) of the 1990 amendments states that the Secretary shall provide that if multiple claims subject to the nutrient content claim regulations are made on a single panel of the food label or page of a labeling brochure, a single statement may be made to satisfy the requirements for referral statements. To ensure that this referral statement is adequately prominent, the agency is proposing in § 101.13(g)(3) that the statement be adjacent to the claim that is printed in the largest type on the panel.

Although section 403(r)(2)(B) of the act requires that if a nutrient content claim is made, that referral statement be immediately adjacent to such claim, the agency believes that for those claims that appear more than one time on a panel, the referral statement need only be presented with the most prominent claim. To require referral statements for multiple claims on the same panel would unnecessarily burden the panel and dilute any other information presented on the panel. FDA is proposing to require that the referral statement be adjacent to the claim that is printed in the largest type because that claim is the one most likely to initially be seen by the consumer.

In addition, the agency believes that it is not necessary to include a referral statement if a claim is made on the panel containing nutrition information, because such claim would be made in view of the nutrition information cited in the referral statement. FDA is proposing to codify this provision in § 101.13(g)(2).

D. Disclosure Statements

Section 403(r)(2)(B)(ii) of the act states that if a food that bears a nutrient content claim "contains a nutrient at a level which increases to persons in the general population the risk of a disease or health-related condition which is diet related, taking into account the significance of the food in the total daily diet, the required referral statement shall also identify such nutrient." FDA is referring to this level as the "disclosure level."

The act goes even further with respect to health claims. In section 403(r)(3)(A)(ii), the act prohibits, except in special circumstances, health claims for a food if any nutrient is present in the food in an amount that increases the risk of disease or health-related condition. FDA will refer to this level as a "disqualifying level." The statutory language defining a disclosure level for a nutrient in conjunction with a nutrient content claim is the same as that for a disqualifying level for the nutrient for a health claim. Consequently, FDA is proposing the same levels for the individual nutrients for both types of claims.

In the proposed rule on health claims published elsewhere in this issue of the **Federal Register**, the agency discusses how it arrived at the various proposed disclosure/disqualifying levels. Briefly, in setting such levels, FDA considered that there are no generally recognized levels at which nutrients such as fat, saturated fat, cholesterol, or sodium in an individual food will pose an increased risk of disease. Therefore, if FDA were to attempt to set these levels on an individual food basis, it would not be possible to do so. However, sections 403(r)(2)(B)(ii) and 403(r)(3)(A)(ii) of the act require that the agency take into account the significance of the food in the total daily diet. For the general population, the intake of fat, saturated fat, cholesterol, and sodium in the total day's diet in excess of dietary recommendations increases the risk of diet-related disease. Therefore, because the agency's proposed DRVs for total fat, saturated fat, cholesterol, and sodium are based on recommended dietary intake levels, the agency tentatively decided to tie the disclosure/disqualifying levels to the DRVs.

To determine the appropriate disclosure/disqualifier levels, FDA used an approach based on the number of servings of food in a day and available information on food composition. As described in the health claims proposal, the agency has tentatively found that an appropriate disclosure/disqualifying

level for individual foods is between 10 and 20 percent of the DRV. The agency made this tentative finding by looking at the food supply. It noted that the nutrients fat, saturated fat, cholesterol, and sodium are present in roughly one half of the general USDA food categories. Therefore, if approximately 20 foods/beverages are consumed in a day, and half of the foods consumed contain the nutrient at a level of 10 percent of the DRV (on average), then the total daily intake of the nutrient would be 100 percent of the DRV. This level of intake would not constitute a risk for chronic disease. On the other hand, if the same number of foods are consumed, and half the foods contain on average 20 percent of the DRV, then the total daily intake of the nutrient would be 200 percent of the DRV, a level of intake that would increase the risk for diet-related disease. The agency then used food composition data to evaluate the effect of establishing various disclosure/disqualifying levels between 10 and 20 percent and tentatively concluded that a level of 15 percent of the DRV was most appropriate. If ½ of the foods consumed during a day contains on average this amount, the total daily intake of the nutrient would exceed the DRVs but without the risks inherent at higher levels. Yet, if this criterion is used, a significant number of foods would not be disqualified. Thus, FDA is proposing § 101.13(h) to establish disclosure/disqualifying levels for total fat, saturated fat, cholesterol, and sodium, and that these levels be 15 percent of the DRV per serving and per 100 grams (g) of food. These levels are 11.5 g for total fat, 4.0 g for saturated fat, 45 milligrams (mg) for cholesterol, and 360 mg for sodium.

The legislative history provides some guidance on how these disclosure statements about the presence of these nutrients should be made. It states that if FDA found, for example, that the fat in a food that bore a nutrient content claim was present at a level that increased the risk of disease or a health-related condition, then the referral statement would read, "See [nutrition panel] for information about fat and other nutrients." Congressional Record H5441 (July 30, 1990). Therefore, the agency is proposing in § 101.13(h) to require this information in the referral statement. Because the agency is proposing in § 101.13(g)(3) that if a single panel of a food label or labeling contains multiple nutrient content claims or a single claim repeated several times, a single referral statement may be made, and because § 101.13(h) only requires the disclosure statement as part of the referral statement, only one disclosure statement per panel would be required by the proposed regulation.

E. Disqualifying Levels for Nutrient Content Claims

Section 403(r)(2)(A)(vi) of the act provides that FDA can, by regulation, prohibit a nutrient content claim if the claim is misleading in light of the level of another nutrient in the food. FDA has tentatively made such a finding with regard to cholesterol claims and the presence of saturated fat. This finding is discussed in the companion document published elsewhere in this issue of the Federal Register. In that document, FDA is proposing to prohibit a claim for cholesterol content in foods containing saturated fat at levels above 2 g per serving.

F. Amount and Percentage of Nutrient Content Claims

Section 3(b)(1)(A)(iv) of the 1990 amendments states that the agency "* * * shall permit statements describing the amount and percentage of nutrients in food which are not misleading and are consistent with the terms [that FDA has defined]." In discussing this provision (which at that time was numbered as section 3(b)(1)(A)(iii)), the legislative history states:

> * * * [t]he Secretary is required, in the regulations, to define the circumstances under which statements disclosing the amount and percentage of nutrients in food will be permitted. Those statements must be consistent with the terms that the Secretary has defined under section 403(r)(2)(A)(i) [definition of descriptive terms] and they may not be misleading under section 403(a) in the current law.
>
> Thus, if the Secretary defined "low fat" as less than 1% fat for a particular category of food, the Secretary might conclude that the statement "Less Than 1% Fat" is consistent with the defined term. However, the Secretary might conclude that the statement "Less Than 2% Fat" is not consistent with the definition of "low" because it implies that the product is low in fat when it is not. Following a similar analogy, the Secretary might prohibit the statement "98% Fat Free" while permitting the statement "More Than 99% Fat Free" for a product where "low fat" has been defined as less than 1% fat.
> (Congressional Record H 5841-2 (July 30, 1990))

Like Congress, FDA is concerned that consumers may be easily misled by statements about the percent or amount of a nutrient in a product. The agency received many comments to the ANPRM asserting that statements such as "____ percent fat free" on foods are confusing and misleading. These comments suggest that many consumers do not understand this type of claim or similar claims that a product contains a specified amount of a nutrient such as "contains ____ mg sodium." Additional comments suggested that such claims be prohibited.

A statement that a food contains X percent of a nutrient implies that the food is useful in maintaining healthy dietary practices. If the level of the nutrient in the food was not in fact useful in structuring a healthy diet, the claim would be misleading. For example, claims that a food is "____ percent fat free" imply that the food has a very small amount of fat in it, and that the food is useful in structuring a diet that is low in fat. The impression that the claim gives is incorrect, however, if the food contains a significant amount of fat.

Similarly, since many consumers have a limited knowledge and understanding of the amounts of nutrients that are recommended for daily consumption, a statement declaring that the product contained a specified amount of a nutrient could be misleading. By its very presence, such a statement could give consumers who were unfamiliar with the dietary recommendations the false impression that the product would assist them in maintaining healthy dietary practices relative to the amount of the nutrient consumed when it, in fact, would not. Consistent with the statute, FDA is proposing not to permit the use of claims that state the percent or amount of a nutrient in those circumstances in which they would be misleading and thus would misbrand the product.

The agency believes that foods bearing such claims must be useful in maintaining healthy dietary practices for the claims not to be misleading. Accordingly, in § 101.13(i), the agency is proposing that foods bearing statements about the amount or percentage of a nutrient in a food must meet the definition for "low" in the case of fat, saturated fat, sodium, and calories and "high" for fiber, vitamins, and minerals, and other nutrients for which that term is defined. These definitions are discussed below, in the regulations for the particular nutrients.

G. Nutrition Labeling

Although the 1990 amendments establish that most foods will bear nutrition labeling, some foods are exempt from these requirements. In addition, there are provisions that permit some foods to bear an abbreviated form of nutrition information.

Under current § 101.9, nutrition labeling is required on all products that contain an added vitamin, mineral, or protein or whose label, labeling, or advertising includes any nutrition claim or information. The agency derived its authority to issue regulations to require this nutrition labeling on all foods bearing a claim for added vitamins, minerals, or protein from sections 201(n), 403(a)(1), and 701(a) of the act (21 U.S.C. 321(n), 343(a)(1), and 371(a)). Under section 201(n) of the act, the label or labeling of a food is misleading if it fails to reveal facts that are material in light of representations actually made in the label or labeling. Under section 403(a)(1) of the act, a food is misbranded if its label or labeling is false or misleading in any particular. Finally, under section 701(a) of the act, the agency has authority to issue regulations for the efficient enforcement of the act.

The agency is proposing in § 101.13(m) that a nutrient content claim may be used on the label or in labeling of a food provided that the food bears nutrition labeling that complies with the requirements in § 101.9 or, where applicable, § 101.36.

The applicability of current regulations to restaurant foods was discussed in rulemaking promulgating § 101.10 *Nutrition labeling of restaurant foods* (39 FR 42375, December 5, 1974 and 41 FR 51002, November 19, 1976). In the preamble to the proposed rule, the agency discussed its belief that nutrition education is of prime importance and stated that it will take every opportunity to foster the dissemination of such information to the consumer, including the use of nutrition labeling in restaurants. However, the agency acknowledged that if nutrition information provided in restaurants necessitates the expense of nutrition labeling, the restaurant "may choose not to provide any nutrition information in advertising or labeling, on the basis that the added cost of providing detailed information * * * might cause the project of providing nutrition information not to be worth the expense" (39 FR 42375). Therefore, to encourage the dissemination of nutrition information in the food service industry, FDA proposed to exempt ready-to-eat foods from the requirement of bearing nutrition labeling on food labels if the required nutrition labeling was displayed prominently on the premises by other means, e.g., counter cards or wall posters, where the information would be readily available to the consumer when he is making a menu selection.

Subsequent action on this proposal led to the issuance of a statement of policy in § 3.207 (recodified as 21 CFR 101.10 in the **Federal Register** of March 15, 1977 (42 FR 14302)) that if any advertising or labeling (other than labels) includes a claim or information about the total nutritional value of a combination of two or more foods (e.g., a combination consisting of a hamburger, french fries, and milkshake), then, as an alternative to providing nutrition information about each separate food on the food label, the restaurant may instead provide information about the total nutritional value of the combination of foods, provided that the statement of total nutritional value follows the nutrition labeling format and provided that the nutrition information is effectively displayed to the consumer both when he/she orders the food, and when he/she consumes the food.

As discussed in the supplementary nutrition labeling proposal published elsewhere in this issue of the **Federal Register**, the 1990 amendments specifically exclude restaurant foods and foods sold in other establishments in which food that is ready for human consumption is sold (hereafter "restaurant food") from the requirement for nutrition labeling. However, as stated above, the agency believes that it has the authority to issue regulations requiring restaurants that choose to make nutrient content claims to adhere to the requirements for such claims, including nutrition labeling.

FDA is not, at this time, making any specific provisions for the nutrition labeling of restaurant foods. FDA specifically seeks comment on how it should handle this issue. On one hand, many believe that it is important that consumers be given useful and meaningful nutrition information. On the other hand, many continue to be concerned, as FDA was in 1974, that the cost of compliance not be so high that restaurants will not be willing to offer and identify through nutrient content claims those foods that will assist consumers in selecting diets that provide health benefits. Therefore, the agency is requesting comments on whether and to what extent it has a basis for nutrition labeling when nutrient content claims are made on restaurant foods, or whether a requirement for such labeling would discourage restaurants from making nutrient content claims because of the cost associated with nutrition labeling.

If, based on comments received, FDA were to require nutrition labeling of restaurant foods, should the requirement apply only to large restaurant chains with fixed menu items? Additionally, should the content or format of nutrition labeling be different for the food service industry than for packaged foods? If so, how and why?

FDA recognized in its July 19, 1990 reproposal on mandatory nutrition labeling (55 FR 29504) that certain restaurant-type food service facilities cannot reasonably be expected to provide information concerning nutrient profiles, and that exemptive provisions should be established for such situations. The proposal advised that comments pointed out that nutrition labeling for foods served in restaurant-type facilities present significant feasibility problems in a number of situations. The comments made the following points: These facilities may not be able to develop consistent nutrient information on the foods that they sell because of frequent menu changes and variations in how the consumer wants the food prepared and served. Without nutrient consistency, frequent nutrient analyses would have to be performed to provide consumers with accurate nutrition labeling information. These analyses could become very burdensome. The cumulative costs of these analyses could place undue restrictions on some establishments. Firms could be inhibited from making frequent menu changes or forced to limit the options that consumers have in ordering a food.

Because of these problems, FDA proposed an exemption under section 201(n), 403(a), and 701(a) of the act for restaurant-type foods in the mandatory nutrition labeling proposal (see proposed § 101.9(h)(2), 55 FR 29516). Although the agency wanted to limit the exemptions to only those situations in which it is needed, FDA did not, and still does not, have sufficient indepth knowledge of the food service industry to develop adequate criteria to fairly impose such a limitation. The agency therefore requests comments on this issue.

A related question is what is to be done with § 101.10. Because § 101.10 was adopted under section 403(a) of the act, it is not subject to State enforcement under section 307 of the act. For this reason, and because § 101.10 has not been enforced by FDA, the agency believes that it is appropriate to make an affirmative statement about the continuing need for this provision. Thus, if FDA elects not to make restaurant labeling part of the Nutritional Labeling Education Act implementation, the agency will, in the final rule, delete § 101.10.

H. Analytical Methodology

The agency has proposed analytical methodology for measuring levels of nutrients in foods in the supplementary nutrition labeling proposal published elsewhere in this issue of the Federal Register. FDA is proposing in § 101.13(n) to use the analytical methodology specified in the final rule based on that proposal to determine compliance with the requirements for nutrient content claims.

I. Exemptions

The 1990 amendments provide certain exemptions from the requirements for nutrient content claims. These are discussed below.

1. Claims in a Brand Name

Section 403(r)(2)(C) of the act states:

Subparagraph (2)(A) does not apply to a claim described in subparagraph (1)(A) and contained in the label or labeling of a food if such claim is contained in the brand name of such food and such brand name was in use on such food before October 25, 1989, unless the brand name contains a term defined by the Secretary under subparagraph (2)(A)(i). Such a claim is subject to paragraph (a).

Paragraph (a) that provision refers to is section 403(a) of the act which states that a food is misbranded if its labeling is false or misleading in any particular.

In discussing section 403(r)(2)(C), the House report states:

Section 403(r)(2)(C) states that section 403(r)(2)(A) does not apply to claims contained in a brand name that was in use before October 25, 1989 (the date the Subcommittee reported the bill). However, if the brand name contains a term that has been defined by the Secretary pursuant to section 403(r)(2)(A)(i), then it must comply with that definition. The disclosure provisions in section 403(r)(2)(B) will also apply to brand names. In addition, section 403(a) of that constitute false and misleading labeling, irrespective of whether the brand name was exempt under this provision.
(H. Rept. 101-538, *supra*, 20.)

Thus, manufacturers may continue to use brand names that include nutrient content claims that have not been defined by regulation so long as these claims appeared as part of a brand name before October 25, 1989 and are not false or misleading. Section 403(r)(2)(B) of the act, which requires the nutrition information referral statement, does apply to foods whose brand name includes such claims. Consequently, the labeling of products whose brand name includes such terms will have to bear an appropriate referral statement.

Accordingly, the agency is incorporating the provisions of section 403(r)(2)(C) of the act into its proposed regulations. Proposed § 101.13(o)(1) states that nutrient content claims not defined by regulation, appearing as part of a brand name that was in use prior to October 25, 1989, may be used on the label or in labeling of a food, provided they are not false or misleading under section 403(a) of the act.

2. "Diet" Soft Drinks

Section 403(r)(2)(D) of the act creates an exception from the requirement that a term may be used only in accordance with the definitions established by FDA for the use of the term "diet" on soft drinks, provided that its use meets certain conditions. First of all, the claim must be contained in the brand name of such soft drink. Secondly, the brand name must have been in use on the soft drink before October 25, 1989. Finally, the use of the term "diet" must have been in conformity with § 105.66. The act provides, however, that the claim remains subject to section 403(a) of the act, in that it would misbrand the food if it is false or misleading in any way.

Accordingly, the agency is proposing in § 101.13(o)(2) that if the claim of "diet" was used in the brand name of a soft drink before October 25, 1989, in compliance with the existing § 105.66, the claim may continue to be used. Any other uses of the term "diet" must be in compliance with amended § 105.66 and the other provisions of the part.

3. Vitamins and Minerals

Section 403(r)(2)(E) of the act states:

Subclauses (i) through (v) of subparagraph (2)(A) do not apply to a statement in the label or labeling of food which describes the percentage of vitamins and minerals in the food in relation to the amount of such vitamins and minerals recommended for daily consumption by the Secretary.

Accordingly, the agency is proposing in § 101.13(o)(3) to permit the use of statements on the label or in labeling of a food that describe the percentage of a vitamin or mineral in relation to the RDI as defined in § 101.9, without specific regulations authorizing claims for each specific vitamin or mineral. The agency is proposing to permit such claims unless they are expressly prohibited by regulation under section 403(r)(2)(A)(vi) of the act.

4. Infant Formulas and Medical Foods

Section 403(r) of the act does not apply to infant formulas subject to section 412(h) of the act (see section 403(r)(5)(A) of the act) or to medical foods as defined in section 5(b) of the Orphan Drug Act. Section 412(h) applies to any infant formula that is represented and labeled for use by an infant who has an inborn error of metabolism or a low birth weight or who otherwise has an unusual medical or dietary problem. Under section 5(b)(3) of the Orphan Drug Act:

[t]he term "medical food" means a food which is formulated to be consumed or administered enterally under the supervision of a physician and which is intended for the specific dietary management of a disease or condition for which distinctive nutritional requirements, based on recognized scientific principles, are established by medical evaluation.

FDA is presenting its views on what constitutes a medical food in its supplementary proposal on mandatory nutrition labeling, which was published elsewhere in this issue of the Federal Register.

Therefore, under section 403(r)(5)(A) of the act, nutrient content claims can be made on foods formulated to meet the unique medical requirements of certain individuals even though FDA has not defined the terms in those claims by regulation. The agency is proposing to reflect this fact in § 101.13(o)(4).

As discussed above, FDA has tentatively concluded that all nutrient content claims are inappropriate for use on the labels of food intended specifically for use by infants and toddlers less than 2 years of age. Therefore, if this proposal is adopted, nutrient content claims will not be permitted on most infant formulas. The agency recognizes, however, that the labels of certain formula products carry statements such as "with added iron" or "low iron." Such statements are already permitted under § 107.10(b)(4), issued under the authority of section 412 of the act.

5. Restaurant Foods

Section 403(r)(5)(B) of the act states:

Subclauses (iii) through (v) of subparagraph (2)(A) and subparagraph (2)(B) do not apply to food which is served in restaurants or other establishments in which food is served for immediate human consumption or which is sold for sale or use in such establishments.

Section 403(r)(2)(A)(iii) through (v) of the act set forth certain labeling requirements and restrictions for foods bearing claims about cholesterol, saturated fat, and fiber. Section 403(r)(2)(B) of the act requires that the referral statement be on all foods that bear nutrient content claims. Although early versions of the bill that became the 1990 amendments exempted restaurant food from virtually all of the requirements for nutrient content claims, the statute, as it was passed, does not. As the legislative history states:

* * * Restaurants that use content descriptors in connection with the sale of food (for example, the use of the word "light" or "low, on a menu) must comply with the regulations issued by the Secretary under 403(r)(2)(A)(i). Restaurants would also be prohibited from stating the absence of a nutrient in food unless they complied with section 403(r)(2)(A)(ii). However, restaurants would be exempt from the disclosure requirements [listed above]. (Congressional Record H5841 (July 30, 1990).

Therefore, the agency is proposing in § 101.13(o)(5) that if a nutrient content claim is used for food that is served in restaurants or other establishments in which food is served for immediate human consumption, or for food that is sold for sale or use in such establishments, the claim must be used in a manner that is consistent with the definition that FDA has adopted. However, the agency is also proposing to provide, under section 403(r)(5)(B) of the act, that such claims are exempt from the requirements for disclosure statements in proposed §§ 101.13 (g) and (h), 101.54(d), 101.62(c), (d)(1)(ii)(C), (d)(2)(ii)(C), (d)(3), (d)(4)(ii)(C), and (d)(5)(ii)(C).

6. Standards of Identity

Section 403(r)(5)(C) of the act states that nutrient content claims that are made with respect to a food because the claim is required by a standard of identity issued under section 401 of the act shall not be subject to section 403(r)(2)(A)(i) or (2)(B) of the act. Thus, a nutrient content claim that is part of the common or usual name of a standardized food may continue to be used even if the use of the term in the standardized name is not consistent with the definition for the term that FDA adopts, or if FDA has not defined the term. Moreover, the label of the standardized food would not need to bear a statement referring consumers to the nutrition label.

It is clear, however, that Congress did not intend section 403(r)(5)(C) of the act to imply in any way that any new standards issued under the act would be exempt from the provisions for nutrient content claims in part 101. Rather, Congress intended that this exemption would apply only to nutrient content claims made in the names of existing standards of identity. The House Report states:

> This exemption was necessary only because of the pre-existing standards for identity. To the extent that those standards provided definitions of content claims that are different from the definitions in the regulations issued by the Secretary under the bill, one basic purpose of the bill will be partially undermined. The Secretary has the authority to correct this problem by amending the portions of the standards of identity pertaining to food labels to conform with the regulations issued under section 403(r). (H. Rept. 101-538, *supra*, 22.)

Therefore, the agency is proposing in § 101.13(o)(6) that nutrient content claims that are part of the name of a food that was subject to a standard of identity on November 8, 1990, the date of enactment of the 1990 amendments, are not subject to the requirements of § 101.13(b), (g), and (h) or to the definitions in subpart D of part 101. Elsewhere in this issue of the **Federal Register**, FDA is publishing a proposal on the use of nutrient content claims and terms that are defined in standards of identity to name new foods.

7. Use of Terms Defined in Response to Petitions

Sections 403(r)(4)(A) (ii) and (iii) of the act authorize the agency to permit the use of certain types of claims in response to a petition, without requiring that the agency grant such approval by regulation. The claims covered by these sections are those made by use of a term that is consistent with a nutrient content claim defined by the agency, i.e., a synonym, or by an implied claim made as part of a brand name. The act sets forth specific timeframes and procedures for FDA's handling of these petitions, which FDA is proposing to codify.

As discussed below in section IV, FDA intends to list any approved synonyms in the regulation defining the underlying nutrient content claim. The regulations will be updated in the annual issuance of the CFR. On the other hand, because brand name approvals apply to individual firms, the agency intends to retain a separate, publicly available list of approved implied nutrient content claims that may be made as part of a brand name.

The agency is proposing in § 101.13(o)(7) to recognize approved implied claims made as part of a brand name (e.g., "healthy") as exceptions to the general requirement in § 101.13(b) that terms used in a nutrient content claim be defined by regulation.

III. Definition of Terms

A. General Approach

1. Use of Reference Daily Intakes and Daily Reference Values in Formulating Definitions

In a proposed rule related to nutrition labeling (55 FR 29476, July 19, 1990), FDA updated and revised the U.S. RDAs used in food labeling and proposed to replace the term "U.S. RDA" with "RDI." In the same proposal, the agency also introduced the term "DRV" and proposed DRVs for eight food components. The proposed DRVs for total fat, saturated fatty acids, unsaturated fatty acids, carbohydrates, and fiber are based upon a diet of 2,350 calories, which is the population-adjusted mean of the recommended energy allowance for persons 4 or more years of age, as calculated based on the 10th edition of the "Recommended Dietary Allowances" (Ref. 4). The DRVs for sodium, potassium, and cholesterol are, however, independent of calories. Throughout this notice, the term "calories" is used instead of the more precise term "kilocalories" because of consumer familiarity with the former term.

With the exceptions of the term "sugars free" and terms related to caloric levels in foods, the agency has limited the proposed definitions to nutrients for which there are proposed DRVs or RDIs. This approach has the advantage of linking nutrient content claims to established reference values, thereby providing a consistent and quantitative basis for defining terms. Additionally, because these reference values were determined using established scientific reports, such as the "Recommended Dietary Allowances" (Ref. 4) as well as recognized consensus reports and dietary recommendations such as the "Surgeon General's Report on Nutrition and Health" (Ref. 2), "Diet and Health: Implications for Reducing Chronic Disease Risk" report (Ref. 3), and "Dietary Guidelines for Americans" (Ref. 1), claims are limited to essential nutrients and nutrients of public health significance.

2. Criteria for Definitions of Terms

a. Serving size to evaluate nutrient content claims. FDA proposed standardized serving sizes for categories of foods in a proposed rule (55 FR 29517, July 19, 1990) to assure reasonable serving sizes and to provide for comparison among similar products. FDA said that these serving sizes, if adopted, would ensure that claims, such as "low cholesterol," were the result of the characteristics of the food and not manipulation of the serving size. The agency stated that these standardized serving sizes would help to ensure that food label claims are not misleading to consumers.

In the 1990 serving size document, FDA proposed that for any container with more than one serving, the proposed standard serving size would be used to determine the appropriateness of a nutrient content claim. For containers identified as a

single-serving containing 100 percent or less of the standard serving size, the agency proposed to evaluate the label claims based on the standard serving size. However, for single-serving containers containing more than 100 percent but 150 percent or less of the standard serving, the agency proposed to evaluate the claim on the basis of the entire content of the package.

A majority of comments on FDA's proposal supported the proposed basis for evaluating the appropriateness of a nutrient content claim. However, many food industry and trade organization comments objected to the proposed evaluation criteria. Such comments generally stated that the standard serving size, not the package content, should be used to evaluate nutrient content claims on all types and sizes of packages. Manufacturers pointed out that under the 1990 proposal on serving size, the same food product that could be labeled as "low sodium" on the basis of the standard serving size might not qualify for a "low sodium" claim when packaged in a single-serving container containing between 100 percent and 150 percent of the standard serving. For example, an 8 fluid ounce (fl oz) container of skim milk containing 126 mg of sodium would meet the criteria for a "low sodium" claim, but a 10 fl oz container of the same milk containing 158 mg of sodium would not.

Because of the complexity of the issues with respect to serving size and the need to obtain additional public comment on the impact of the 1990 amendments and the IOM report (Ref. 5) on this subject, FDA announced a public meeting to discuss issues related to serving size determination (56 FR 8084, February 26, 1991). In the notice of the public meeting, FDA asked for comments about the role that serving size should play in defining nutrient content claims and asked for data to support any views presented. The public meeting was held on April 4, 1991, and provided opportunity for both oral and written comments.

In comments for this meeting, a manufacturer suggested that FDA establish reference serving sizes, and that both the reference serving size and the serving size declared on the label be used to evaluate the compliance with FDA criteria for nutrient content claims. The agency believes that this suggestion is a reasonable approach to regulating the use of nutrient content claims not only on single-serving containers but also on all other products when the serving size declared on the label differs from the reference standard (e.g., products in discrete units such as muffins). Therefore, in the agency's reproposal on serving sizes, published elsewhere in this issue of the **Federal Register**, FDA has set forth reference amounts customarily consumed per eating occasion (reference amounts) for 131 food product categories (§ 101.12(b)). In accordance with provisions of the 1990 amendments that require label serving sizes to be expressed in common household measures, proposed § 101.9(b)(2) in the same document provides procedures for manufacturers to use in converting the reference amounts, generally in metric measures, to label serving sizes most appropriate for their specific products.

In proposed § 101.12(g) of that document, FDA is proposing that, if the serving size declared on the product label differs from the reference amount listed in proposed § 101.12(b), both the reference amount and the serving size declared on the product label be used in determining whether the product meets FDA criteria for nutrient content claims as set forth in proposed subpart D of part 101.

Consistent with proposed § 101.12(g), FDA is proposing for nutrient content claims that all per serving criteria (e.g., 2 mg or less per serving for "cholesterol free" claims) will apply to the serving size declared on the product label and, where the label serving size and the reference amount differ, to the reference amount as well. Therefore, taking the preceding requirements and using skim milk as an example, the proposed reference amount customarily consumed for all beverages is 240 milliliters which is equivalent to 8 fl oz. When considering an 8 fl oz container, the reference amount and the label serving size are the same. Eight fl oz of milk contain 126 mg of sodium, and because the proposed definition for "low sodium" is 140 mg or less, the container could bear a "low sodium" claim.

However, when considering a 10 fl oz container, the label serving size is larger than the reference amount. Ten fl oz of skim milk contain 158 mg of sodium, an amount exceeding the definition for "low sodium." Therefore, while the amount of sodium in the reference amount of skim milk is within the definition, the amount of sodium in the labeled serving size is not. Hence, if this proposed rule is adopted, the 10 fl oz container could not bear a "low sodium" claim.

While acknowledging the different treatment resulting from this approach, FDA tentatively concludes that it would be misleading to allow claims based only on the reference amount since, particularly with single-serving containers, the consumer would be expected to consume the entire labeled serving size. Likewise, it would also be misleading to allow claims based only on the labeled serving size. If claims were defined in this way, manufacturers could manipulate serving sizes so that their products could bear a claim.

In proposed subpart D of part 101, the agency is specifically providing that the quantitative criteria must be met "per label serving size and per reference amount customarily consumed." Rather than complicating the discussions concerning proposed quantitative amounts in this preamble, however, FDA will abbreviate "per label serving size and per reference amount customarily consumed" as "per serving."

The agency had also considered as an alternative approach, defining nutrient content claims based solely on the amount of the nutrient in a specific amount of food, such as the amount of nutrient per 100 g of food. This approach has the advantage of presenting a nutrient content claim for a food in a way that is more consistent with labeling used internationally, and it may allow consumers a method to more readily compare very dissimilar foods. However, FDA does not believe that this approach alone is appropriate for the initial definition of descriptors. Foods vary greatly in weight or density and are consumed in various amounts depending upon their nature and use in the diet. The agency believes that content claims for certain nutrients, fat for example, could be misleading and not useful to consumers when applied equally to 100 g of nuts and to 100 g of spinach. Therefore, FDA decided to not propose the amount of nutrient per specified weight of food as the primary basis for evaluating nutrient content claims, but as discussed in the following section, the agency will consider a weight-based criterion to preclude claims attributable only to small serving sizes.

b. *Need for criterion based on a designated weight.* After reviewing comments received in response to the 1989 ANPRM as well as analyses of food composition, FDA has tentatively concluded that in some cases an additional criterion to the amount of nutrient per serving is needed to prevent claims from being misleading. The use of a criterion based on a serving is generally appropriate, but for a certain limited number of foods with small serving sizes, the use of the serving size criterion alone would allow claims on foods that are dense in a nutrient on a per weight basis but that have such small serving sizes that the food

qualifies for a content claim. For example, butter and some margarines contain 110–140 mg sodium per serving but contain as much as 900 mg per 100 g of food. The agency considers this situation to be problematic because some of these foods may be consumed frequently during the day and, thus, ultimately make significant contributions to the diet despite their purporting to be limited in a particular nutrient. Furthermore, such claims may be counterproductive relative to educating consumers about the nutrient quality of foods.

The use of an additional criterion based on the amount of a nutrient per specified weight of food is consistent with FDA practice. As provided in current § 105.66(c), the agency has used an additional criterion based on a designated weight of food (i.e., 1 g) for the term "low calorie." Recent analyses of available information on composition (modification of USDA's Nutrient Data Base, Standard Reference Release 9 (Ref. 6)) conducted by FDA indicate that for nutrients other than calories, there are foods that would meet a "low" criterion for amount per serving but still, on a weight basis, contain a substantial amount of the nutrient (Ref. 7). For example, assuming the use of a definition of "low fat" as less than or equal to 3 g per serving, a dessert topping that contains approximately 2 g of fat per serving would meet the definition of "low fat," but contains as much as 25 g of fat per 100 g of food.

Therefore, the agency is proposing to require that the definition of certain descriptors include an additional criterion based on the amount of nutrient per specified weight of food, specifically per 100 g of food. (For an instance in which the agency is not proposing to use this criterion, see the discussion of "low saturated fat" in the companion document on fat, saturated fat, and cholesterol claims.) while the agency has tentatively concluded that a weight-based criterion is not an appropriate criterion when used alone, in conjunction with the per serving criterion it helps to preclude the possibility of misleading claims attributable to small serving sizes alone.

Despite the agency's previous proposal to require an additional criterion based on percent dry weight for terms related to fat descriptors (55 FR 29456), FDA is not proposing to include percent dry weight as an additional criterion for any descriptor. Comments received by the agency in response to the 1989 ANPRM, at the public hearings on the ANPRM, and in response to the tentative final rule on cholesterol descriptors have persuaded FDA that the use of percent dry weight as an additional criterion would prevent the use of certain descriptors (e.g., "low fat") on foods such as salad dressings modified to be low in fat as well as on certain vegetables that surpass the criterion established using percent dry weight because of high water content. For instance, a radish contains 0.5 g of fat per serving and 0.5 g of fat per 100 g of food (Ref. 7). However, on the basis of percent dry weight it contains 10 g per 100 g of dry matter (Ref. 8). The agency, therefore, is not proposing to include a percent dry weight criterion in the definition of any nutrient content claim.

c. *Additional criteria.* FDA also is proposing to include additional elements in the definitions of certain specific claims in response to section 403 (r)(2)(A) of the act. For instance, the agency is proposing in the companion document on fat, saturated fat, and cholesterol descriptors to limit cholesterol content claims based on the amount of saturated fat present in the food (e.g., proposed § 101.62(d)(1)(i)(8)). These additional criteria will be discussed in conjunction with the individual claims.

3. Need for Consistency of Terms and Limited Number of Terms

In reviewing the requirements of the 1990 amendments, the agency has given considerable attention to the apparent need to develop a system of nutrient content claims that: (1) Is consistent in definitions, (2) is in keeping with public health goals, (3) can be used by consumers to implement dietary recommendations. Over the years, FDA has stressed the importance of consistent definitions and descriptive terms as a necessary requirement for effective education and for preventing misleading labeling (Ref. 9). The definition of more terms than is necessary to convey the qualities or characteristics of a food relative to dietary recommendations has the potential to increase the difficulty of educating the public about the meaning and interpretation of nutrient content claims and could result in food labels that are needlessly confusing to consumers. An approach that limits the number of defined terms is consistent with that advocated by a report of the Committee on the Nutritional Aspects of Food Standards, International Union of Nutritional Sciences (IUNS) (Ref. 10), which stated that caution should be exercised to constrain the number of descriptors that are considered desirable. The IUNS Committee questioned the wisdom of more detailed descriptors because of the difficulties of consumer understanding of a plethora of such terms.

Additionally, as suggested by the IOM report on nutrition labeling (Ref. 5), the use of consistent and targeted content claims increases consumers' confidence in the validity of the claim. Consumer discussions that occurred as part of focus group activities recently conducted by the agency (Ref. 11) revealed that the current plethora of terms has caused consumers to conclude that nutrient content claims are not so much targeted claims intended to be used in selecting foods to meet dietary recommendations as they are merely marketing techniques used by the manufacturer to get the consumer's attention and to sell a product. In these discussions, consumers stated that the frequent use and the number of terms currently appearing on food labels can result in "overload" and cause them to be skeptical of the validity of the statement.

Alternatively, some have argued that flexibility in the use of terms facilitates consumer understanding by attracting attention to the message being delivered. In addition, this argument suggests that more defined terms or flexibility to use various terms to convey nutritional information encourages competition among products and fosters nutritional improvements in products. The agency solicits comment on how it can balance those goals of consumer understanding and competition.

4. Synonyms

As discussed above, section 403(r)(2)(A)(i) of the act states that a nutrient content claim must be defined by regulation. In addition, section 3(b)(1)(A)(ix) of the 1990 amendments provides that those regulations may include similar terms commonly understood to have the same meaning. Although the agency does not have a comprehensive list of such terms that are actually in use, some synonymous terms have been suggested. Some have argued that the use of these terms defined by other label information, will be useful to industry as well as consumers.

In a letter of May 10, 1991 (Ref. 12), the Grocery Manufacturers of America, Inc. (GMA) submitted a list of synonyms that it considered to be illustrative of the type of synonyms that could be used. The GMA list is set forth below for comment.

No

free
meaningless
never a ____ (bit, trace, etc.)

none	
not a ___ (bit, trace, etc.)	
not any	
zero	
Very Low	
dab	pinch
dash	slight
hardly any	smidgen
inconsequential	tinge
insignificant	tiny
meager	touch
minimum	trifling
negligible	trivial
next to nothing	very little
Low	
few	short
little	small
Significant	
added	goodness
consequential	important
enhanced	meaningful
enriched	sizeable
fortified	source
good source	supplemental
High	
intense	major
loaded	rich
lots	
Very High	
chief	predominant
excellent	preeminent
fantastic	super
finest	superior
great	terrific
outstanding	

On the other hand, as stated above, the IOM has raised concerns that the proliferation of synonymous terms on food labels will be confusing to consumers who may believe that there are differences among the terms. Accordingly, and because of agency resource constraints and the strict timeframes under which this rulemaking is being issued, FDA is only providing for similar terms for those descriptors that refer to absolute values such as "free" in these regulations. However, if information submitted in comments substantiates that authorizing a number of synonyms will be useful and not misleading, FDA will include a range of synonymous terms in the final regulations. In addition, petitions requesting permission to use specific synonymous terms may be submitted after the procedural regulations proposed in this document become effective.

B. Terms Describing the Level of a Nutrient

1. "Free"

a. *Backaround.* Nutrient content claims, that a nutrient is absent from a food, have historically been considered to have the most relevance for persons on strict therapeutic diets. The agency is of the opinion that the inclusion of such foods as part of a total daily diet would be useful to consumers attempting to limit their intake of certain nutrients in accordance with dietary recommendations. Furthermore, FDA believes that the ability to make claims describing a product as "free" of a particular nutrient would provide an incentive to manufacturers to make available alternative foods that will be helpful in meeting dietary recommendations. Finally, under section 3(b)(1)(A)(I) of the 1990 amendments, FDA is required to define the term "free," unless it finds that use of the term would be misleading.

The comments that FDA has received in response to the proposals that it has issued over the years to define the term "free," as well as in response to the 1989 ANPRM, have generally supported the use of this term in nutrient content claims. The IOM report on nutrition labeling, while not recommending a specific definition for this term, discussed its meaning in the overall context of nutrition labeling efforts and did not recommend against its inclusion as a nutrient content claim (Ref. 5). The IUNS Committee suggested that the term "free" was useful, and that the definition should be based on assuring the public that the food contributes truly insignificant amounts of the component to the diet (Ref. 10). Internationally, several countries including Canada have established definitions for nutrient free claims, including claims for calories and sodium.

The agency is therefore proposing to define "free" for the following nutrients: total fat, cholesterol, sodium, sugars, and calories. FDA is proposing definitions for "free" for these nutrients because limiting the amounts of these nutrients in the diets of many individuals is of public health importance (Refs. 2 and 3). The terms "fat free" and "cholesterol free" are defined in the companion proposal published elsewhere in this issue of the **Federal Register.**

b. *Statutory limitations on circumstances in which an absence ("free") claims may be made.* For a food to be labeled as a [*nutrient*] free [*product*], under section 403(r)(2)(A)(ii)(I) of the act, the nutrient must usually be present in the food or in a food that substitutes, as that term is defined by the Secretary (and by delegation, FDA), for the food. Under this provision, an appropriate absence claim would be "sodium free Italian bread" because Italian bread usually contains salt. In addition, beaten, frozen whole egg substitutes can be labeled as "cholesterol free." Although these products inherently contain no cholesterol, they have been formulated for use in cooking as a substitute for beaten whole eggs, which do contain cholesterol.

FDA recognizes, however, that there may be some confusion as to the circumstances in which one food may be considered to substitute for another food. Therefore, in § 101.13(d), FDA is proposing to define when one food may be considered to substitute for another.

FDA is proposing that a substitute food is one that is used interchangeably with another food that it resembles in its physical characteristics (e.g., organoleptic properties and physical attributes) and in its performance characteristics (functional properties such as cooking and shelf life). Although FDA recognizes that substitute foods, such as substitutes for beaten whole eggs, may not be identical to the food for which they are a substitute, it believes that they should bear a substantial resemblance to that food and be able to be used like that food. (Substitutes for beaten whole eggs resemble beaten whole eggs and can be used in cooking like beaten eggs.) To the extent that a substitute food does not have the characteristics of the food for which it substitutes, FDA believes that that difference must be declared on the label or in the labeling of the substitute food, adjacent to the most prominent claim as defined in § 101.13(j)(2)(ii). FDA is proposing to require that this declaration be made in proposed § 101.13(d)(1).

For example, some foods with altered fat content cannot be used in cooking. The disclaimer would, therefore, state, adjacent to the most prominent claim, "Not for use in cooking." The agency tentatively concludes that information about such a difference is material under section 201(n) of the act because it bears on the consequences that may result from the use of the food, and that the substitute would be misbranded under section 403(a) of the act if the difference is not declared. To ensure that the disclaimer is presented with appropriate prominence, the agency is proposing in § 101.13(d)(2) that it be in easily legible print or type, no less than one half the size of the descriptive term (see section II.C. above).

In addition, the substitute food should not be nutritionally inferior, as defined in § 101.3(e)(4), to the food for which it substitutes. However, some foods, to meet the definition of the descriptive term for a particular nutrient, may be nutritionally inferior. Under § 101.3(e), these foods must be labeled as "imitation" foods. FDA believes that identifying imitation foods that meet the

descriptor definition may provide a benefit to the consumer, even though they are nutritionally inferior. Therefore, FDA tentatively concludes that such foods should be allowed to bear the appropriate nutrient content claim as long as they are appropriately labeled.

Section 403(r)(2)(A)(ii)(II) of the act states that absence (i.e., "free") claims may be made for foods if FDA allows such claims based on a finding that the claim would assist consumers in maintaining healthy diets, and the claim discloses that the nutrient is not usually present in the food.

FDA believes that highlighting that a food is free of a nutrient can help consumers maintain healthy dietary practices whether the food is inherently free of that nutrient or is processed to be that way. Furthermore, FDA surveys have shown that consumers want nutrient content claims and use them in making food selections, and that many respondents reported difficulty in understanding the quantitative information presented in nutrition labeling (Ref. 13). In addition, descriptive terms that highlight positive nutritional attributes (such as "fat free") help to educate consumers on the intrinsic properties of foods (Refs. 14 and 15). FDA believes that the definitions in this proposed rule respond to consumers' needs. Therefore, FDA has tentatively concluded that it is not necessary to limit absence or "free" claims to foods in which the nutrient is usually present or that substitute for foods that usually contain the nutrient.

However, the unqualified use of the term "free" on foods that are inherently free of a nutrient can be misleading because such terminology would imply that the food has been altered or specially processed or formulated to reduce the nutrient as compared to other foods of the same type. Accordingly, FDA is proposing for calories in § 101.60(b)(1)(ii) and for sodium in § 101.60(b)(1)(ii) to require that if a food is free of a nutrient without the benefit of special processing, alteration, formulation, or reformulation to lower the content of the nutrient, the relevant claim must refer to all foods of that type and not merely to the particular brand to which the labeling is attached. The agency is proposing a similar requirement for foods that are inherently fat or cholesterol free in the companion document published elsewhere in this issue of the **Federal Register**. For example, many fruits and vegetables would meet the definition for the term "fat free." If the agency adopts its proposed approach, a "fat free" claim on broccoli would have to be made as "broccoli, a fat-free food." FDA is proposing a similar rule if a food is inherently "low" in a nutrient.

This requirement is consistent with the general policy on nutrient content claims set forth in current § 105.66(c)(2) for low calorie foods, with that on "free" and "low" claims discussed in the preamble to the final rule on sodium claims (49 FR 15510 at 15517), and with that proposed in § 101.25 (a)(2)(i) and (a)(2)(ii) of the tentative final rule for both "free" and "low" cholesterol claims (55 FR 29456). The agency believes that this requirement is necessary to prevent the consumer from being misled by an implication that a particular food has been altered to lower its fat content, for example, when in fact, all foods of that type are naturally free of, or low in, fat. Therefore, it is proposing such a requirement in § 101.13(e)(2). Conversely, FDA is providing in proposed § 101.13(e)(1) that if a food has been specifically processed, altered, formulated, or reformulated to remove the nutrient from the food, it may reflect this fact by using the terms "free" or "low," as appropriate, before the name of the food.

FDA is aware that the effect of proposed § 101.13(e)(2) will be to allow to allow "free" or "low" claims on foods that do not usually contain, or are usually low in, the nutrient (e.g., "Brand A soft drink, a fat-free food"). However, for the reasons stated above, the agency believes that this course is the appropriate one. FDA specifically requests comments on this aspect of its proposal.

c. *How definitions of "free" for nutrients were derived.* In arriving at the proposed definitions for "free," the agency chose the level of the nutrient that is at or near the reliable limit of detection for the nutrient in food and that is dietetically trivial or physiologically inconsequential. This approach is consistent with that used by the agency in the past for defining "free." FDA established a policy of using "free" as a descriptor of physiologically insignificant components when it adopted the regulation for sodium descriptors (49 FR 15510, April 18, 1984). This approach is also consistent with the comments and recommendations submitted to the agency in response to the 1989 ANPRM.

The claim "(*nutrient*) free" is a representation that the food does not contain the nutrient. The agency believes that this representation can be made in good faith if the food inherently contains very small amounts of the nutrient because the amount present is physiologically insignificant. Such a representation cannot be made in good faith, however, if the manufacturer intentionally adds the nutrient to the food as an ingredient. In such circumstances, even though the nutrient might not be of dietary consequence, it is obvious when reading the ingredient statement that it has been added. The agency has received comments, including a letter from the state attorney general from Minnesota, writing on behalf of eight other state attorneys general, expressing the view that such labeling is misleading to consumers (Ref. 16). Thus, FDA tentatively concludes that representing the food as free of the nutrient when the nutrient is intentionally added, even at very small amounts, would cause confusion and be false and misleading under sections 201(n) and 403(a) of the act. To reflect this tentative conclusion, the agency is proposing to add an additional ingredient-based criterion to definitions for "free" for sugar and sodium, as discussed below and for fat, as discussed in the companion document on fat, saturated fat, and cholesterol that a product may not be labeled as free of a nutrient if that nutrient is added as an ingredient. However, some have suggested that this distinction creates a discrepancy between naturally occurring "insignificant" amounts and those that are added.

As an alternative approach, it would be possible to allow "free" claims even though the nutrient is added, if the label includes a disclosure statement in association with the claim acknowledging the addition of the nutrient. In order for the claim to be not misleading, such a disclosure statement would need to be prominent and immediately adjacent to the claim each time it is made. Such a disclosure might state, "An insignificant amount of fat has been added to this product as an ingredient." This approach was suggested by the Minnesota Attorney General, as an alternative if FDA determined that it was not feasible to prohibit nutrient free claims on products that contained a very small amount of a nutrient added as an ingredient (Ref. 16). The agency solicits comments on whether nutrient free claims should be allowed on products that contain a very small amount of the nutrient as an ingredient if such products provide an appropriate disclosure statement and, if so, what such a disclosure statement should be.

The agency points out that, although a product would not be allowed to call itself "free" of a nutrient if a manufacturer intentionally added the nutrient to the food as an ingredient,

under the regulations as proposed, the label could make other positive, true, nonmisleading statements about the product such as how little of the nutrient is actually in the product. For example, if a manufacturer found that it was necessary to add a very small amount of fat to a product to assure that the product was palatable to consumers, the label could make a statement reflecting the amount of fat in the product provided that that amount of that nutrient could meet the definition for "low fat." Such a statement might be: "contains less than ½ g of fat per serving," or if accurate, "99 percent fat free." This labeling is consistent with § 101.13(i) which states that, in addition to statements about the percent of a vitamin or mineral in a food relative to the RDI, the label or labeling of a product may contain a statement about the percent or amount of a nutrient that implies that the food is high or low in a nutrient if the food actually meets the definition for either "high" or "low" as defined for the nutrient that the label addresses.

In addition, the label or labeling of a product may bear a variety of other positive statements about the product such as the product is "low," or in the case of sodium, "very low," in the nutrient or that the amount of the nutrient in the food is reduced, if that is the case, or that there is less of the nutrient in the product than in some other product.

FDA is not proposing to include a criterion that is based on the amount of the nutrient per 100 g of food for the term "free." FDA considered the need to include this criterion and has tentatively concluded that because the level of each nutrient must be so low to qualify for a "free" claim as to be physiologically insignificant, even frequent consumption of such foods would not be sufficient to have any meaningful affect on the overall diet. For example, the proposed definition for "sodium free," discussed below is, an amount in a food equal to or less than 5 mg of sodium per serving. If a "sodium free" food were consumed as often as twenty times a day, the intake of sodium from "sodium free" foods would be no more than 100 mg of sodium, and it would likely be less. Given the proposed Daily Reference Value (DRV) for sodium of 2,400 mg per day, this intake of sodium would constitute less than 5 percent of the DRV and cannot be considered substantial or of physiological significance.

Additionally, consistent with the regulations on "free" claims that it has issued (current 21 CFR 101.13(a)(1)), FDA is proposing in the supplementary nutrition labeling proposal that foods meeting the criterion for "free" may declare the nutrient content as "zero" on the nutrition label. Such a declaration will prevent the confusion that would result if quantitative declarations other than zero were made on foods bearing nutrient-free claims. While some comments have suggested that the term "free" will mislead consumers into believing that a food so labeled is completely without the nutrient, the agency tentatively concludes that no harm will result because the foods that would be eligible to be labeled with this term contain a trivial amount of the nutrient compared to the total dietary intake of the nutrient for any particular individual.

d. *Synonyms for "free".* FDA is proposing to allow the use of the terms "no," "zero," "trivial source of," "negligible source of," and "dietarily insignificant source of," as synonyms for the term "free." For example, a food that meets the criterion for "sodium free" could also be labeled with the terms "no sodium" or "zero sodium." As discussed above, the agency is concerned about the proliferation of synonymous terms because of the potential to confuse and mislead consumers. However, the agency does not believe that there is potential for consumers to misinterpret the terms "no" or "zero," and therefore the agency is proposing to provide for the use of these specific synonyms. The agency requests comments on whether consumers commonly understand the meaning of all these terms and whether they are synonymous.

e. *Specific definitions*—i. *"Sodium free" and terms related to salt.* In its 1984 regulation on sodium descriptors (21 CFR 101.13), FDA defined a "sodium free" food as one containing less than 5 mg of sodium per serving. FDA established this definition to ensure that a food that met it would contribute only a trivial amount of sodium to the total diet for all individuals (49 FR 15510). Furthermore, while the agency recognized that it would be almost impossible to consume a diet consisting of nothing but "sodium free" foods, it stated that availability of such foods would be helpful in balancing the sodium intake from foods that necessarily contain larger amounts of sodium. According to FDA's 1988 Diet and Health Survey (Ref. 17), sodium remains the most commonly mentioned component that consumers try to avoid in their diet. Moreover, the recent National Food Processors Association survey on food labeling (Ref. 18) reported that 88 percent of shoppers felt label information on sodium was either somewhat or very important.

The agency is proposing to redesignate existing § 101.13 (21 CFR 101.13) as § 101.61 and to retain in paragraph (b)(1) of that section, the definition of "sodium free," as less than 5 mg of sodium per serving. The agency believes that this definition is consistent with the concept of a dietetically trivial amount in foods and is unaware of any evidence that would suggest that this definition should be changed.

Some comments on the 1989 ANPRM suggested that an additional criterion, such as 5 mg per 100 g of food, be included in the "sodium free" definition to avoid categorizing foods as "sodium free" when the serving size is small and consumption may be frequent. However, as discussed above, FDA is not proposing a second criterion for the use with definitions for "sodium free." The intake of foods containing less than 5 mg sodium, even if frequent, is unlikely to contribute a meaningful amount of sodium to the overall diet.

As mentioned above, FDA believes that the label of a food that bears a "(*nutrient*) free" claim can be misleading if that nutrient is also declared as an ingredient in the ingredient list. Most consumers recognize that salt is a significant source of sodium in foods, and the agency is aware that the terms "salt" and "sodium" may be used interchangeably by many consumers. Yet some consumers may not have a clear understanding of the difference between these two terms. These terms are not the same. Sodium chloride, or common table salt, contains almost 40 percent sodium and is only one of several sources of sodium in the diet. Other common sources of sodium include baking powder (sodium aluminum sulfate), monosodium glutamate, and baking soda (sodium bicarbonate). There are numerous other sodium compounds commonly used as ingredients, but their use is at such low levels that they are correctly perceived as not contributing significantly to dietary intake of sodium, e.g., sodium citrate and sodium bisulfite.

The agency is proposing in § 101.61(b)(1)(ii) to include in the definition of "sodium free" that the food must not contain added salt (i.e., sodium chloride) or an added ingredient that contains sodium. This provision is based on the agency's view that, as discussed above, consumers would be confused by the presence of a "sodium free" claim on a food with, for example, sodium citrate declared in the ingredient list. This provision is consistent with proposed definitions for fat and sugar. While FDA

recognizes that the use of trivial amounts of sodium-containing compounds included for flavor or preservation purposes is not likely to have a meaningful impact on the overall sodium content of the diet, the agency is concerned that consumers will note the presence of these ingredients in the ingredient list and be confused as to the significance of the "sodium free" claim. FDA, however, specifically requests comments concerning the appropriateness of restricting ingredients in foods making sodium free claims and of the alternative approach of allowing the claim in the presence of an appropriate disclosure statement.

In the past, FDA has defined or provided conditions for the use of "salt free" and other terms containing the word "salt" § 101.13(b)), so as to prevent the terms from being misleading to consumers. The agency has said elsewhere in this document that statements about an ingredient that lead one to make an assumption about the level of a nutrient are implied nutrient content claims which are not being defined at this time. Salt is an ingredient, and thus claims concerning salt content could be considered to be implied nutrient content claims. However, FDA is tentatively proposing to retain the current provisions for the use of the term "salt" in a somewhat modified form in § 101.61(c).

The agency believes that because of the confusion between "salt" and "sodium," any food bearing the claim "salt free" must meet the definition of "sodium free." Therefore, the agency is proposing this requirement in § 101.61(c)(1).

In § 101.61(c)(2), FDA is proposing to define the terms "without added salt," "unsalted," and "no salt added," which are currently defined in § 101.13(b). These terms may be used only if no salt is added to the food during processing but is added to the food for which the food that bears the claim will substitute (e.g., peanuts). In addition, in response to a comment, the agency is proposing to require a declaration on the food label that the food is not sodium free, if that is in fact the case, to avoid misleading consumers when claims that a food is unsalted or contains no added salt are made.

This proposed declaration is consistent with current FDA regulations (21 CFR 105.66) concerning the use of the term "sugar free." The concern that consumers could interpret this term as an indication that a food is low in calories prompted the agency to require that any food not low or reduced in calories but making a statement about the absence of sugar must bear a statement that it is not a low calorie or reduced calorie food.

ii. *Sugars free.* Several comments received by the agency in response to the 1989 ANPRN and public hearings suggested a need for the agency to define descriptor terms for the absence of sugar or sugars. The ION report on nutrition labeling (Ref. 5) also recommended that FDA define descriptor to be used for the sugar content of foods.

(a) *Regulatory history: "Sugar" and "Sugars".* FDA has traditionally held that the term "sugar" in an ingredient list means "sucrose" and does not include other sugars. In 1974, FDA proposed to permit the term "sugar" to also include invert sugar (39 FR 20888). The agency withdrew that proposal on June 21, 1991 (56 FR 28592 at 28607) and at the same time denied a request to allow the term "sugar" in the ingredient list to include glucose and fructose (including high fructose corn syrup). "Sugar" is defined in 21 CFR 184.1854 (53 FR 44870, November 7, 1988). That regulation states that the terms "sucrose," "sugar," "cane sugar," and "beet sugar" are appropriate names for sucrose. Therefore, in the ingredient list, the term "sugar" is limited to sucrose.

FDA addressed the issue of the use of the terms "sugar free," "sugarless," and "no sugar" in its July 19, 1977 findings of fact and tentative order on label statements for special dietary foods (42 FR 37166). At that time, the agency stated that consumers may associate the absence of sugar with weight control claims and with foods that are low calorie or that have been altered to reduce calories significantly. The agency concluded that any food making a statement about the absence of sugar would have to bear a statement that the food is not low calorie or calorie reduced, unless the food is a low or reduced calorie food. The agency stated that without this disclosure, some consumers might think the food was offered for weight or calorie control.

Evidence had been introduced at the public hearing on special dietary food regulations to show that the "sugarless" claim is useful to identify foods like chewing gum, which is in sustained contact with the teeth, in which the use of a sweetener other than a fermentable or cariogenic carbohydrate may not promote tooth decay.

In the final rule on label statements for special dietary foods published in the **Federal Register** of September 22, 1978 (43 FR 43248), FDA required a statement that a food is not low calorie or calorie reduced (unless it is in fact, a low or reduced calorie food) when a "sugar free," "sugarless," or "no sugar" claim is made for the food. The agency also allowed for the use of alternative statements, such as "not for weight control" and "useful only in preventing tooth decay." The statements that the food is not low calorie or not useful for weight control were needed because the term "sugar free" meant only that the food was sucrose free. A "sugar free" food could contain other, fermentable carbohydrates.

More recently, in a 1981 report in entitled "Task Group Report on Nutrition Labeling of Sugars," a special task group comprised of representatives from FDA, USDA, and FTC developed guidelines for labeling of sugars in food products (Ref. 19). These guidelines were intended to serve as the criteria necessary to develop regulations for quantitative sugars labeling. The tri-agency task group concluded that quantitative label declarations for sugars should be based on the content (by weight) of total sugars, both added and naturally-occurring. They defined "total sugars" as the sum of all mono- and oligosaccharides through four saccharide units and their derivatives, such as sugar alcohols.

During the last several years, FDA has sent letters to food manufacturers that have set forth agency policy on the use of the term "sugar free." In a 1988 memorandum (Ref. 20) and memorandum of telephone conversation (Ref. 20a), the agency addressed the question of whether a "sugar free" claim would be considered appropriate for a food containing maltodextrin as an ingredient (e.g., a popsicle). FDA responded that, based on the recommendations of the tri-agency task group, a food product with a substantial amount of maltodextrin as an ingredient most likely would be considered misbranded if it bears a "sugar free" claim because while it may contain no added sucrose, it still contains significant amounts of indigenous sugars and sugars other than sucrose. FDA also responded (Ref. 21) to a question concerning the appropriateness of a "sugar free" claim on a product containing polydextrose by noting that at least 10 percent of polydextrose (by weight) qualifies as "sugar" and thus is subject to the same guidelines as specified for maltodextrin.

In mid-1989, FDA responded to a question about the appropriateness of a "sugar free" claim for a product sweetened with a nonnutritive sweetener but that contained lactose, polydextrose, sorbitol, and mannitol (Refs. 22 and 23). The agency pointed out that § 105.66(f)(1) states that "[C]onsumers may reasonably be

expected to regard terms that represent that the food contains no sugars or sweeteners, e.g., 'sugar free,' 'sugarless,' 'no sugar,' as indicating a product which is low in calories or significantly reduced in calories." Noting that the statement in § 105.66 says "no sugars or sweeteners," FDA concluded at the time that the absence of ingredients that, generically, are sugars or nutritive sweeteners is basic to a "sugar free" claim. Because lactose, polydextrose, and sugar alcohols are sugars or nutritive sweeteners, the agency could not conclude that the product was "sugar free."

Finally, in response to the 1990 amendments, FDA is publishing elsewhere in this issue of the **Federal Register** a supplementary proposal on nutrition labeling in which the agency is proposing a chemical definition for sugars and providing for the mandatory declaration of the sugars content of foods. FDA is proposing to define "sugars" as the sum of all free mono- and oligosaccharides (and their derivatives) that contain four or fewer saccharide units and to include sugar alcohols in that definition. However, FDA is proposing to permit a separate declaration of the amount of sugar alcohols on a voluntary basis. This definition of "sugars" is consistent with the guidelines developed by the tri-agency task group on sugars labeling (Ref. 19)

FDA is not, however, proposing a DRV for sugars because the leading consensus reports have not provided a quantitative recommendation for the intake of sugars.

Thus, in the ingredient label, the term "sugar" is limited to sucrose, and the agency is proposing to use the broader term "sugars" in the nutrition label.

(b) *Need for change.* In considering the appropriateness of defining the term "sugar free," the agency took into account the guidelines and regulations that it has developed on this term, the current and proposed definitions for "sugar" and "sugars," and the potential for the term "sugar free" to be misleading. The agency has received a comment indicating that this term, when used to refer to the absence of only sucrose, may be misleading to consumers, even though the nutrition labeling will list calorie content. Furthermore, the dietary guidelines issued jointly by DHHS and USDA stipulate that Americans should "use sugars only in moderation" and define "sugars" as table sugar (sucrose), brown sugar, raw sugars, glucose (dextrose), fructose, maltose, 'lactose, honey, syrup, corn sweeteners, high-fructose corn syrup, molasses, and fruit juice concentrate (Ref. 1).

The 1978 rule concerning the use of the term "sugar free" centered around sucrose or table sugar. However, more recent FDA regulatory policy, based primarily on the tri-agency report on sugars labeling, has specified clearly that the agency considers the term "sugar free" to be most appropriate for foods that do not contain sugars or nutritive sweeteners, although FDA has not addressed this issue specifically for food products such as chewing gum sweetened with sugar alcohols which may be useful in not promoting dental caries. As stated above, the proposed definition for "sugars" for nutrition label purposes includes not only mono- and oligosaccharides but also sugar alcohols (56 FR 28592)

Given the consumer interest in the sugars content of food, the fact that current dietary guidelines recommend that consumers "consume sugars in moderation" (Ref. 1), and the agency's longstanding practice of providing for the use of a descriptive term intended to indicate the absence of sugar in some form, FDA is tentatively proposing to define the claim "sugars free" in § 101.60(c). FDA is defining this term to mean the absence of total sugars rather than the absence of sugar (i .e., sucrose).

The agency considers it important for nutrient content claims to be consistent with the nutrition label, which serves as a source of specific information for consumers concerning the nutritional value of the food. As stated above, the agency has proposed to require that the nutrition label contain information on the sugars content. FDA is concerned that there would be potential for confusion if the nutrient content claim were to use the term "sugar," and the nutrition label were to specify information using the term "sugars." Such a discrepancy could make it more difficult to implement education efforts pertaining to label information.

The need for consistency is supported by the IOM report on nutrition labeling (Ref. 5). The report highlights the importance of the content claims on the principal display panel being supported by the quantitative values listed in the nutrition information panel. Furthermore, "sugars free" is consistent with the terminology used in government dietary recommendations, specifically "Nutrition and Your Health, Dietary Guidelines for Americans" (Ref. 1), which advise that sugars should be consumed in moderation.

The agency acknowledges that it has been a common practice to use the term "sugar free" rather than "sugars free," but FDA believes that the term "sugars free" is more appropriate for the reasons stated above. The agency believes that anticipated education efforts to assist consumers in interpreting the nutrition label (including the term "sugars") will improve consumer understanding of the term "sugars free." Furthermore, even if consumers continue to interpret the term "sugars free" as synonymous with sucrose free (i.e., "sugar free"), consumers will not be misled or harmed because a "sugars free" food will in fact be sucrose free.

(c) *Definition.* FDA is proposing to define "sugars free" as less than 0.5 g of sugars (i.e., all free mono- and oligosaccharides and their derivatives that contain four or fewer saccharide units as well as sugar alcohols) per serving. In defining the term, the agency considered both the amount that would be trivial from a dietary intake perspective as well as that level that could be reliably detected using available laboratory methodologies. In the supplemental nutritional labeling proposal, FDA proposed that analytical values for sugars content that are less than 0.5 g per serving could be declared as zero on the nutrition label. On this basis, FDA is proposing in § 101.60(c)(1)(i) to define "sugars free" as containing less than 0.5 g sugars per serving.

In the past, FDA has not provided a definition for the term "sugars free" relative to its use in managing or planning diabetic diets, although the agency has provided for the use of certain declarative statements so as to avoid confusion among persons with diabetes (§ 105.67). Recently, the American Diabetes Association (ADA) issued a policy on the use of caloric sweeteners in recipes and foods intended for use by diabetics (Ref. 24). The new policy is more liberal than previous policy concerning the inclusion of caloric sweeteners in diabetic diets. The permitted intake of sucrose, honey, molasses, and other caloric sweeteners is 1 teaspoon per serving size. This amount of sweetener is equal to approximately 4 g of sugar per serving.

The proposed definition for "sugars free" is less than or equal to 0.5 g per serving, well below the 4 g amount suggested by ADA. Thus, the use of the term is not contradictory to current recommended diabetes management practices. However, the agency wishes to emphasize that definitions of nutrient content claims do not specifically address issues related to diabetes management, and that diabetes management should not be based solely on the consumption of "sugars free"

foods. Rather, diet planning for diabetics should encompass the entire diet and be supervised by a trained professional.

The agency believes that the amount of sugars allowed in a food bearing a "sugars free" claim is so small that even frequent consumption of such a food will not result in an intake of sugars that would affect the overall diet in any meaningful way. Therefore, FDA is not proposing an additional criterion based on the weight of the food.

However, the agency is proposing a criterion in the definition of "sugars free" to prevent the use of the term on the labels of products to which a sugar has been deliberately added (proposed § 101.60(c)(1)(i)). Despite the fact that these foods can meet the criterion of "sugars free," confusion could occur if the ingredient list for a food bearing the term included any sugars deliberately added. Therefore, the proposal states that to bear a "sugars free" claim, no ingredient in the food can be an added sugar. As stated in previous sections, the agency solicits comment on the appropriateness of this policy.

Finally, FDA continues to believe that any food that bears a statement about the absence of sugars should bear a statement indicating that the food is not low calorie or calorie reduced unless the food meets the requirements for a low or reduced calorie food. Without this disclosure, some consumers might think the food was offered for weight or calorie control. As discussed above, this requirement is already established in § 105.66(f) and will be recodified as § 101.60 (c)(1)(iii)(A) and (c)(1)(iii)(B).

(d) *Sugar alcohols.* The agency acknowledges that this approach for defining "sugars free" would preclude the use of the term on certain products such as chewing gums that contain sugar alcohols (also known as polyols) as nutritive sweeteners and have for some time stated on the label the potential benefit of their product in not promoting tooth decay.

The agency is concerned that these products serve a useful purpose in that they offer an alternative to chewing gums that contain sucrose. FDA also believes that there is some benefit to the consumer in label statements that identify these gums by noting the difference in the two types of products. Accordingly, the agency believes that gums containing no sucrose may continue to be able to bear the terms "sugar free," "sugarless," and "no sugar" along with the other statements currently required in § 105.66(f). The agency is therefore proposing in § 101.13(o)(8) to permit these products to continue to bear sugar free claims provided that the label also bear, when the food is not low or reduced calorie, a statement such as "Not a reduced calorie food," "Not a low calorie food," "Not for weight control," or "Useful Only in Not Promoting Tooth Decay." As has been required in § 105.66(f), this term should be immediately adjacent to the claim each time it is used.

However, the determination of the usefulness in not promoting tooth decay of gums sweetened with sugar alcohols was based on data that are now over 20 years old. The agency intends to reevaluate this determination in light of new data and current scientific criteria. The agency solicits comments specifically on whether the terms "sugar free," "sugarless," and "no sugar" on chewing gum would be confusing in light of the total sugars declaration in the nutrition label and on whether those terms may be useful in spite of any such confusion. In addition, the agency specifically solicits data on the effects of consumption of these sugar alcohols and on any other types of products that should be included in the exemption in proposed § 101.13(o) (8).

(e) *Synonyms.* In § 105.66(f), the agency provided for the use of the term "sugarless" as well as "sugar free" and "no sugar." However, as specified earlier in the introductory section, the agency is proposing to allow five terms as synonyms for "sugars free." The agency is proposing these terms in § 101.60(c). However, the agency is proposing not to provide for use of "sugarless" for several reasons. To be consistent and thus synonymous with "sugars free," the term defined would have to be "sugarsless." The agency believes that the synonyms defined are sufficient to advise consumers of the absence of sugars in a food, and that there is no need to define additional terms at this time.

(f) *Unsweetened, no added sweeteners.* In the September 22, 1978 final rule on label statements for special dietary foods (43 FR 43248), FDA also addressed the terms "unsweetened" and "no added sweeteners." The agency concluded they were factual statements about the organoleptic properties of the foods. FDA is not aware of any reason to change this view. Therefore, unlike the term "sugar free," these terms, when used for foods with apparent inherent sugars content (such as juices), are not subject to the requirements of section 403(r) of the act for nutrient content claims. FDA is reflecting this fact in proposed § 101.60(c)(3).

FDA is unaware of any evidence to indicate that the use of these terms has been misleading to consumers. The agency advises that it will use the definition of sweeteners in proposed § 101.4(b)(21) in determining the appropriateness of the terms "unsweetened" and "no added sweeteners" on a food label. FDA included this definition in its proposal on ingredient declaration in the Federal Register of June 21, 1991 (56 FR 28592). The agency considers that the final rule on that proposal will provide an adequate basis for these terms.

(g) *No added sugars.* While FDA has not issued regulations for the use of the terms "no added sugars," "without added sugars," or "no sugars added," the agency has provided advice concerning their use. In a 1979 letter to the Sugars Association (Ref. 26), FDA stated that the terms "no sugar added" and "no sucrose added," when unqualified, may reasonably be interpreted by consumers to mean that these foods are low or reduced in calories. The agency also stated that such claims should be supplemented either by statements that disclose the presence of, or the usefulness of, the alternative sweetener or by other explanatory statements as appropriate to minimize the likelihood of consumer confusion.

In a 1984 letter to representatives of a food manufacturing firm (Ref. 27), FDA reiterated its earlier position concerning the term "no sucrose," stating that its unqualified use may be misleading, and that the agency had long felt that food labeling claims that highlight either the presence or absence of a particular sweetening substance, unless appropriately qualified by additional statements that are understandable to the ordinary consumer, have the potential to mislead and confuse. The letter also pointed out that the statements "no sucrose added" and "no sugar added," without further qualification, may reasonably be interpreted by consumers to mean that these foods are low or reduced in calories. It continued that therefore, such claims should be supplemented either by statements that disclose the presence of, or the usefulness of, the alternative sweetener or by other explanatory statements. FDA specifically stated that it did not object to a factual statement that a food is "sweetened with fructose (etc.) instead of sugar."

In 1985 (Ref. 28), FDA stated that it believed that the statement "No sugar—Honey Sweetened" was acceptable because "no sugar" implied no table sugar. In 1987 FDA responded to a request for clarification from a food manufacturer (Ref. 29) by stating that the term "no sugar added" may be used on the labels of fruit spread provided

that each time the statement appears, it is accompanied by a qualifying statement explaining the manner in which the product is sweetened, for example "sweetened with concentrated grape juice." On January 3, 1990, FDA sent a notice of adverse findings to a food manufacturing firm (Ref. 30) that included a statement that a label claim of "no sugar added" was false and misleading when applied to a product that contains sugar from sugar cane juice.

Thus, in providing advice on the use of the terms "no added sugar," "no sugar added," and "without added sugar," the agency has generally considered the intent of these claims to be limited to claiming the absence of so-called table sugar, that is, sucrose. FDA has expressed concern that consumers may expect such products to be low or reduced in calories and has therefore stated that statements as to whether the food is low calorie or reduced calorie content, as well as to the presence or use of alternative sweeteners, should accompany the claim.

Thus, for terms such as "no added sugar," as for "sugar free," FDA considered whether to continue to limit their application only to sucrose. Currently, a variety of added nutritive sweeteners are used in foods, and these sweeteners often contain sugars other than sucrose. Dietary guidelines (Ref. 1) stipulate that Americans should "consume sugars only in moderation" and indicate that sugars other than sucrose should be consumed in moderation.

Therefore, given current dietary recommendations, FDA has tentatively concluded that the use of a descriptive term that implies that the product has been made without adding sugars would be more helpful to consumers in implementing such recommendations than would a term that is limited only to sucrose (i.e., "sugar"). However, the agency believes that to avoid misleading consumers, such terms should be limited to foods that would be expected to contain added sugars. Claims concerning the absence of added sugars on products that would not normally contain added sugars, for example canned tuna or potato chips, are likely to mislead consumers into thinking that a particular brand may be more desirable when compared to other brands of the same product. Based on all of these factors, the agency is proposing to provide for "no added sugars" claims, to define them in terms of the other proposed definitions pertaining to sugars, and to specify provisions for their proper use.

The agency is proposing in § 101.60(c)(2) that claims for the absence of added sugars apply only to those foods to which sugars have not been added during processing or packaging. This provision is consistent with the provisions proposed above with respect to the addition of salt to foods. Also, consistent with earlier provisions, the agency is proposing to require that products bearing a "no added sugars" claim bear a statement that the food is not low calorie or calorie reduced, if applicable. Furthermore, the agency believes that it would be misleading to claim "no added sugars" if an ingredient that contains added sugars, for example jam, is added to the product. The agency also believes that it would be misleading to claim "no added sugars" if the sugars content of the product has been increased by the manufacturer using a means such as adding enzymes to the product. Consumers would expect that a product bearing a claim for "no added sugars" would contain only sugars naturally present in ingredients, when in fact the manufacturer would have deliberately "added" to the sugars content of the product via the addition of enzymes.

The agency is proposing in § 101.60(c)(2) to permit the use of the terms "no added sugars," "without added sugars," or "no sugars added." These claims will be permitted only if:

(1) No amount of sugars (as defined for nutrition labeling purposes in § 101.9) is added during processing or packaging;

(2) The product does not contain ingredients that contain added sugars, such as jam, jelly, and concentrated fruit juice;

(3) The sugars content has not been increased above the amount naturally present in the ingredients of the food by some means such as the use of enzymes;

(4) The food that it resembles and for which it substitutes normally contains added sugars; and

(5) The product bears a statement indicating that the food is not low calorie or calorie reduced (unless the food meets the requirements for a low or reduced calorie food) and directing consumers' attention to the nutrition panel for further information on sugars and calorie content.

iii. "*Calorie free*". The agency has recognized that people who are interested in controlling their weight can be aided if the level of calories in a food is brought to their attention, particularly when the calorie level is low (42 FR 37166). Accordingly, FDA responded to the need for descriptive terms for claims concerning the caloric content of foods by defining "low calorie" and "reduced calorie" (43 FR 43248). However, the agency has not proposed a definition for "calorie free." Comments received by the agency in response to the 1989 ANPRM and at the public hearings stated that the term "no calories" or "calorie free" should be defined by the agency.

While FDA has not defined the term "calorie free," current § 105.66(e) provides for the term "diet" for use when a food is represented as being useful in reducing caloric intake or reducing or maintaining body weight. The term has often been used on foods that are virtually free of calories, such as specially formulated soft drinks. However, under § 105.66(e) (1), a "diet" food is not necessarily a food free of calories because "diet" may be used with products that are low or reduced in calories.

FDA is proposing to define "calorie free" because the ability to call attention to products free of calories will provide useful guidance to consumers who are seeking to control their caloric intake. The agency, however, notes that such a claim may be applicable to relatively few foods in the food supply and therefore, requests comments on the appropriateness of providing such a definition.

The agency is proposing in § 101.60(b)(1)(i) to define the term "calorie free" as less than 5 calories per serving. The proposed nutrition labeling regulation which is publishing elsewhere in this issue of the **Federal Register** provides for the declaration of the calorie content of a food as zero when caloric levels are less than 5 calories per serving. The agency believes that this level of calories can be considered trivial and of no physiological significance. Even frequent consumption of such "calorie free" foods would not result in a caloric intake great enough to affect in any meaningful way on the overall intake of calories. For example, if "calorie free" foods were consumed 20 times a day, the usual number of servings a person consumes, the intake of calories from such foods would be no more than 100 calories. As a point of reference, the population adjusted mean intake of calories per day is 2,350. Additionally, as discussed above, FDA is proposing five terms as synonyms for "calorie free."

2. "Low"

a. *Background.* Nutrient content claims that describe the level of a nutrient as "low" are among the most common claims on labels but are not consistently defined or used (Refs. 5 and

10). FDA's first efforts to define the term "low" were made regarding calories, particularly so that the term could be used to assist in weight control. On September 22, 1978 (43 FR 43248), FDA issued a final rule that established a definition for "low calorie." In 1984 (49 FR 15510), FDA issued a rule defining "low sodium," and on November 25, 1986 (51 FR 42584), FDA proposed a definition for "low cholesterol" which was expanded upon in the tentative final rule on July 19, 1990 (55 FR 29456). The agency also has developed guidelines for use of the term "low fat" in experimental shelf-labeling programs (Ref. 31).

Current dietary recommendations (Refs. 1, 2, and 3) make clear the continued usefulness of identifying or calling attention to foods low in the nutrients of which consumers have been advised to limit their intake including fat, saturated fat, cholesterol, sodium, and calories. Comments from a variety of consumer and professional organizations strongly support the use of the term.

Definitions for "low" can also be found internationally. Canadian regulations and guidelines specify conditions for the use of the term to describe fat, cholesterol, sodium, and calorie content (Ref. 32), and a Codex Alimentarius standard for foods for special dietary uses defines "low sodium" (Ref. 33). Further, Codex guidelines that would define "low" for a number of other nutrients are in development, as is a European Community directive on labeling claims that includes claims relating to low content.

The agency is proposing to define "low" for the following nutrients: total fat, saturated fat, cholesterol, sodium, and calories. The definitions for "low fat," "low saturated fat," and "low cholesterol," and the basis for those definitions, are presented in the companion document published elsewhere in this issue of the **Federal Register**. FDA is not proposing definitions for low content claims for other nutrients because low levels of these other nutrients in foods are not of public health importance according to major consensus documents such as the "Diet and Health: Implications for Reducing Chronic Disease Risk" (Ref. 3) and The Surgeon General's Report on Nutrition and Health (Ref. 2).

While the agency has defined "sugars free," FDA does not believe that it is appropriate to define "low sugars." Unlike the claim "sugars free," which is based on the absence of sugars in a food, a definition for a "low" level of sugars (or any other nutrient) in foods should relate to the total amount recommended for daily consumption. Because the available consensus documents do not provide recommendations for daily intake of sugars, FDA is not proposing a reference value for this nutrient. The agency has thus tentatively concluded that without quantified recommendations for sugars intake, a definition for low levels of sugars in food cannot be specified.

b. *How definitions of "low" for nutrients were derived.* In the **Federal Register** of July 19, 1977 (42 FR 37166), FDA provided a basis for the definition of "low." Although the definition was specific to calories, the principle can be applied to other nutrients. The agency stated that "low" should designate foods of distinctly low nutrient value, but the level for "low" should not be restricted to foods that can be "eaten freely in numerous servings." Thus, FDA's view in 1977 was, and the agency continues to believe, that the designation "low" should not necessarily mean that the nutrient is present in the food in an inconsequential amount as with "free," but rather that the selection of a food bearing the term "low" should assist consumers in assembling a prudent daily diet and in meeting overall dietary recommendations to limit certain nutrients. The agency believes that to meet current dietary guidelines, it should not be necessary for persons to limit their diets solely to foods "low" in the nutrients that the guidelines recommend limiting. Rather, FDA expects that educational efforts will stress the importance of a total daily diet that is comprised of a mixture of foods, some of which may be "low" in a particular nutrient and some of which may not.

In establishing the proposed definitions for "low," FDA has tentatively concluded that there should be a single definition of what is low for each nutrient that would be applicable to all foods, rather than several definitions for use with specific categories of foods. As discussed in the companion document on claims for fat, saturated fat, and cholesterol content (published elsewhere in this issue of the **Federal Register**), FDA received a comment that requested that the agency define "low fat" differently for different foods, that is, that FDA vary the quantitative definition of "low" according to food category and designate as "low" those foods that are relatively low compared to other foods in the food category. The agency rejects this approach.

The use of different criteria for different food categories has several disadvantages that affect both consumers and the food industry. When different criteria are used for different categories of foods, consumers cannot use the descriptors to compare products across categories and will likely find it difficult to use the descriptors for substituting one food for another in their diets.

Although an argument can be made that different criteria for different foods would permit consumers to identify the products with the lowest (or highest) nutrient level in a category, the agency believes that such a system would have a high potential for misleading the consumers about the nutrient content of foods. The product that has the lowest nutrient content in a category is not necessarily low in the nutrient. Also, with different criteria for different food categories, it would be possible that some foods that did not qualify to use the descriptor would have a lower content of the nutrient than foods in other categories that did qualify.

Furthermore, in this document, FDA is proposing to provide for the use of relative claims on the labels of food products, claims that are intended to alert consumers that a particular product, when compared to a similar product, is lower or higher in certain nutrients. FDA believes that this approach is more appropriate for consumers to identify favorable or desirable products within a food category.

FDA has received many comments asking for increased consistency among nutrient content claims to aid consumers in recalling and using the defined terms. In addition, the IOM report recommended that "low sodium," for example, should have the same meaning whether it is applied to soup, frozen peas, or meat (Ref. 5). Accordingly, the agency concludes that establishing different cutoff levels for each nutrient content claim for different food categories would greatly increase the complexity of using such claims to plan diets that meet dietary recommendations. Therefore, the agency is proposing a single definition for "low" for each nutrient across the entire food supply.

FDA believes that the most logical starting point for the definition of "low" is the level that FDA has defined as the measurable amount of the nutrient in a serving of a food. In § 101.3(e)(4)(ii), FDA has defined this amount as 2 percent or more of the reference value (i.e., U.S. RDA), the level at which all of the nutrients in question can be measured in all or nearly all foods.

The reference value for the nutrients for which FDA is proposing to define the

claim "low" is the DRV rather than the U.S. RDA, but all the nutrients in question have proposed DRVs. Two percent of the proposed DRV, then, is an amount that can be considered to be low relative to overall recommended intakes.

Looking at this definition from a different perspective, FDA has generally estimated the number of servings of foods and beverages to be 16 to 20 per day. The Minnesota Nutrition Coordinating Center has estimated the average number of servings of foods and beverages to be 20 per day (Ref. 34). If the nutrient were contained in all foods, and 2 percent of the DRV was adopted as the basis of the proposed definition for "low," persons who selected only foods designated as "low" in the nutrient would have a daily intake of the nutrient that would be no more than 40 percent of the proposed DRV (i.e., 2 percent times 20 servings). Thus, 2 percent of the DRV as a definition for "low" provides for a quantitatively low amount in food that is sufficiently restrictive to allow consumers to select a variety of foods, including some that are "low" in a nutrient and some that are not "low," and still meet current dietary recommendations.

On the other hand, the agency believes that 2 percent of the DRV can be overly restrictive as a definition for "low" for those nutrients that are not contributed by all food categories or that are found in relatively few foods. FDA believes that in defining the term "low," the amount per serving for nutrients that are not found in all categories of foods can be larger than for nutrients that are ubiquitous in the food supply. For example, assume that nutrient X is spread across 20 foods/ beverages in a day, while the intake of nutrient Y is contributed by only 10 foods/ beverages in a day, that is one-half as many as contribute to the intake of nutrient X. If the definition of "low" for nutrient X is established as 2 percent of the DRV, the consumption of only foods "low" in nutrient X results in an intake of 40 percent of the DRV, that is 2 percent times 20 foods/beverages. If the definition for "low" for nutrient Y is set at 4 percent (i.e., twice than 2 percent) the consumption of only foods "low" in nutrient Y also results in an intake of only 40 percent of the DRV because only 10 foods containing the nutrient are eaten in a day (i.e., 4 percent times 10 foods/beverages in a day). If the definition of 2 percent of the DRV for "low" had been applied to nutrient Y, then the intake of nutrient Y would be only half the intake of nutrient X. Thus, such a limit on nutrient Y would be overly restrictive.

However, this general approach cannot be precisely refined because there are only limited data available to determine the number of foods eaten in a day that may be expected to contribute the various nutrients. Furthermore, distributions of nutrients among food categories may not reflect the patterns of consumption of consumers. FDA is thus tentatively proposing to apply a rough and simplistic "rule of thumb" for adjusting the 2 percent DRV definition for "low" for those nutrients that appear to be less than ubiquitously distributed among foods and therefore are assumed to be consumed less frequently than nutrients that are present in virtually all foods consumed during the day.

The agency used the FDA Regulatory Food Composition Data Base (Ref. 6) to examine the availability of nutrients from foods in 18 USDA-defined food categories (for example, vegetables; fruits; cereal grains and pasta; milk, cheese and eggs; meat, poultry and fish; legumes; nuts; and fats and oils) (Ref. 35). For this analysis, FDA considered that a nutrient is found in a food category if over half of the foods in the category contain 2 percent or more of the proposed RDI or DRV for the nutrient in question. The agency further considered a nutrient to be:

(1) Ubiquitously distributed if it was found in more than 75 percent of the food categories;

(2) Moderately distributed if it was found in 51 to 75 percent of the food categories; and

(3) Not widely distributed if it was found in 50 percent or fewer of the food categories.

After gathering the results of this review, the agency applied factors to adjust the "low" definition for a nutrient (i.e., 2 percent of the DRV) depending on the nutrient's estimated distribution across food categories. However, because of the variable nature of diets selected by individuals, precise factors could not be developed, so the agency applied general factors.

If the nutrient is available from approximately 50 to 75 percent of food categories, FDA believes that it is reasonable to expect that it may be available from perhaps as few as half of the foods/beverages consumed. In other words, assuming that as many as 20 foods/beverages are consumed in a day (Ref. 34), it is reasonable to expect that a nutrient that is moderately distributed in the food supply is available from perhaps as few as 10 of the foods/ beverages. In this case, the agency has used a factor of 2 times 2 percent or 4 percent of the DRV (i.e., doubling) in arriving at the definition of low. If the nutrient is found in half or less of the foods consumed, that is, if it is not widely distributed, FDA believes that it is reasonable to find that the nutrient will be consumed in seven or fewer foods a day. In this case, a factor 3 times 2 percent, or 6 percent, of the DRV, is reasonable. If the nutrient is ubiquitous across food categories, FDA is not proposing to adjust the definition of "low."

As described below, in arriving at the definitions for "low," FDA evaluated each nutrient in light of this general rule of thumb, past policy, other available data and information, and current public health recommendations.

c. *Criterion based on weight.* As discussed above in section III.A.2.b. of this document, the agency believes that in addition to a criterion based on the amount of a nutrient per serving, a criterion based on the amount of nutrient per quantity of food is needed to control claims on nutrient-dense foods with small standard serving sizes. Without a limitation on the amount of nutrient per 100 g of food, declarations for "low" levels of a nutrient could be misleading. Analyses of FDA's Regulatory Food Composition Data Base (Ref. 6) suggest that there are a number of foods that would meet the "low" criterion for amount per serving but that would still contain a substantial amount of the nutrient on a weight basis (Ref. 7). For example, as stated above, certain margarines or spreads contain about 130 mg of sodium per serving but contain over 900 mg per 100 g. In this circumstance, a small serving size would result in a nutrient-dense food qualifying for a "low" content claim if only the per serving criterion is used.

A criterion based on weight is currently provided in § 105.66(c) for the term "low calorie." That regulation stipulates that a "low calorie" food must not provide more than 0.4 calories per g of food. Similarly, FDA is proposing to include a second criterion based on the amount of the nutrient per 100 g of food in the definition for "low" for all but one of five nutrients identified above.

d. *Foods inherently "low" in a nutrient.* Consistent with the agency's conclusion pertaining to foods inherently "free" of a nutrient, the agency believes that the use of terms such as "low sodium" or "low fat" on foods that are inherently low in that nutrient can be misleading (see proposed § 101.13(e)(2)). Accordingly, FDA is proposing for calories in § 101.60(b)(2)(ii) and for sodium in

§ 101.61 (b)(4)(iii) to require that for claims of low nutrient content on foods that meet the definition for "low calories" or "low sodium" without benefit of special processing, alteration, formulation, or reformation to decrease the nutrient content, that the label refer to all foods of that type and not merely to the particular brand to which the labeling attaches. For example, applesauce would inherently meet the definition for "low sodium." Therefore, if the agency adopts these proposed provisions, a jar of applesauce could be labeled with a statement such as "applesauce, a low sodium food." The agency is proposing in § 101.61(b) (2) (iii) a similar requirement for "very low sodium foods." These requirements are consistent with the general policy on "free" nutrient content claims discussed above.

The agency is proposing a similar requirement for "low fat," "low saturated fat," and "low cholesterol" claims in the companion document published elsewhere in this issue of the Federal Register.

e. *Synonyms.* FDA is proposing as synonyms for "low" the terms "little or (few)," "small amounts of," and "low source of." The agency is proposing these synonyms to provide flexibility for industry. FDA requests comments on whether consumers commonly understand these terms to have the same meaning as "low."

f. *Specific definitions.*— i. *"Low sodium and very low sodium".* In defining sodium claims for the current regulation on sodium labeling (21 CFR 101.13), FDA considered the number of servings of food that the average American consumes each day (49 FR 15534, April 18, 1984). Based on 20 servings per day as a reasonable average number of servings for adults and a criterion of 140 mg of sodium per serving, the agency estimated that the consumption of 20 "low sodium" foods would contribute about 2,800 mg of sodium per day. FDA stated that it was likely that persons on "mildly restricted" diets would consume a number of sodium free foods or foods containing very low levels of sodium, thereby providing some flexibility in the diet to allow for the consumption of sodium from other sources such as drinking water or table salt. In the 1984 final rule, FDA also cited evidence that more than 50 percent of the foods in the analysis that it did at the time fell below 140 mg per serving, suggesting that the term would have a reasonably broad application in the food supply.

Thus, in 1984, FDA defined "low sodium" as less than or equal to 140 mg sodium per serving. FDA had originally proposed that the term "low sodium" be defined as 35 mg or less per serving (47 FR 26580). However, comments on the proposed definition persuaded the agency that 35 mg or less of sodium was a level too low to be broadly useful to the general public. The agency therefore modified its definition of this term. However, the agency added the term "very low sodium" and defined it as less than or equal to 35 mg sodium per serving. In the 1984 final rule, FDA concluded that "very low sodium foods" would be useful to individuals in the population wishing to reduce their total sodium intake to a more moderate level and would be especially useful to individuals on medically restricted diets.

Thus, the descriptive terms for sodium have been defined and used for approximately 8 years, and the agency believes that consumers have become familiar with the terms "low sodium" and "very low sodium." In general, comments received in response to the 1989 ANPRM and at the public hearings did not indicate a need to change the definitions for these terms. Several comments supported keeping the existing criteria. For these reasons, the agency is proposing to retain 35 mg or less per serving as the first criterion for the definition of "very low sodium" and 140 mg or less per serving as the first criterion for the definition of "low sodium."

The agency is aware that this definition for "low sodium" is not consistent with the general basis on which FDA is proposing to define "low" claims. With the exception of all fruits and raw vegetables, sodium is present in or added to many categories of foods in the food supply. Therefore, if sodium were considered to be ubiquitous in the food supply, the general rule of thumb could result in an initial definition for "low sodium" of 2 percent of the DRV or 48 mg of sodium per serving. Clearly, 48 mg of sodium per serving is considerably lower than 140 mg of sodium per serving. Even if the agency were to conclude that sodium cannot be considered to be ubiquitous, and consequently the value representing 2 percent of the DRV for sodium was doubled, the criterion would still be only 96 mg or less sodium per serving.

The agency considered defining the term "low sodium" as 96 mg or less per serving (i.e., that amount reflective of approximately 4 percent of the DRV for sodium), and not defining "very low sodium." Such an action would be consistent with the most recent dietary recommendations and with the agency's general goal of limiting the number of descriptor terms. However, such an action would be contrary to the majority of comments received by the agency in response to the 1989 ANPRM concerning the level for "low sodium." Therefore, FDA is proposing to retain the definition for "low sodium" as 140 mg or less per serving and to define "very low sodium" as 35 mg or less per serving.

The agency specifically requests comments concerning these definitions. FDA is interested in comments concerning: The appropriateness of the definitions given recent consensus reports and dietary recommendations such as the NAS Diet and Health report; whether substantially increased public health benefits could be realized by using a criterion lower than 140 mg per serving for defining sodium; and the utility of retaining both the "low sodium" and "very low sodium" terms.

FDA is proposing a second criterion for defining "low sodium" as 140 mg or less sodium per 100 g and "very low sodium" as 35 mg or less sodium per 100 g. The per 100 g criterion is needed to control claims on sodium-dense foods with small serving sizes because, as explained above, these foods may be consumed frequently, resulting in a substantial total daily intake of sodium. Because the claim would be misleading to consumers unless both the per serving and per 100 g criteria are met, the agency is proposing that both must be satisfied to meet the definition. Examples of foods for which the proposed sodium descriptors could not be used because they do not meet both criteria for "low" include olives with 105 mg sodium per serving but 750 mg per 100 g and butter/spreads with about 120 mg sodium per serving but over 800 mg per 100 g. In the case of "very low," the foods excluded as a result of the second criterion include canned beef gravy with 28 mg of sodium per serving but 50 mg per 100 g. (However, canned beef gravy would be able to bear a "low sodium" claim.)

Accordingly, the agency is proposing in § 101.61(b)(2)(ii) that the term "very low sodium" may be used on the label and labeling of foods that contain 35 mg or less of sodium per serving and per 100 g, and in § 101.61(b)(4)(ii) that the term "low sodium" may be used on the label and in labeling of foods that contain 140 mg or less of sodium per serving and per 100 g.

ii. *"Low calorie".* Obesity is a major health problem in the U.S., and dietary recommendations consistently stress the need to maintain a healthy weight. FDA believes that people can be helped to control their weight if foods that are low in calories are brought to their attention (42 FR 37166, July 19, 1977).

In 1978, FDA established in 21 CFR 105.66 a definition for "low calorie" (43 FR 43248, September 22, 1978). In the preamble to its tentative rule (42 FR 37166, July 19, 1977), FDA accepted the concept that the designation "low calorie" should apply to foods of distinctly low caloric value in a single serving. However, as stated above, the agency rejected the view that low calorie foods are only those that are so low in caloric value that they can be eaten freely, without adding significantly to the caloric content of the total diet. The agency stated that the proposed definition of "low calorie" would require that consumers apply reasonable judgment in selecting "low calorie" foods as part of an overall dietary pattern. FDA said that consumers could determine from nutrition labeling how much of a particular food they could consume per day without adding significantly to their total caloric intake. The agency stated that this approach was appropriate because caloric requirements vary considerably from person to person.

In 1978, FDA defined, in § 105.66(c)(1)(i), "low calorie" as 40 calories or less per serving (43 FR 43248, September 22, 1978). The agency stated that this definition would include only foods of distinctly low caloric value while at the same time allowing a reasonable number of foods to be labeled as "low" in calories, as supported by analyses of available data bases. FDA also provided for a second criterion for the definition of "low calorie" of 0.4 calories or less per g of food (i.e., 40 calories per 100 g) (§ 105.66(c)(1)(i)). The agency stated that this level was appropriate because available data indicated that foods generally considered the most useful types of low calorie foods (e.g., most soups, juices, fruits, and vegetables containing 40 calories or less per serving) also satisfy this second, density-based criterion.

In response to the 1989 ANPRM and recent public hearings, the agency received numerous comments from a variety of consumer and professional organizations strongly supporting the use of the term "low calorie." In the time since the 1978 rule, public health policy and dietary recommendations relative to caloric intake have not changed appreciably, although there is evidence that the problem of obesity may have increased (Ref. 3). The concepts articulated in the 1977 rule remain appropriate for current dietary recommendations and, in the opinion of the agency, remain appropriate as a basis for defining "low calorie."

While a DRV for calories has not been established, FDA used a reference caloric intake of 2,350 calories in establishing the DRVs for other nutrients. This reference level is the population-adjusted mean of the recommended energy allowance for persons four or more years of age, as indicated in the 10th Edition of the "Recommended Dietary Allowances" (Ref. 4). The agency used this reference caloric intake in reviewing the current definition for "low calorie." Calories are ubiquitous across food categories (Ref. 35), and therefore using the general approach described above, 2 percent of 2,350 calories (i.e., 47 calories) would be a reasonable starting point for the definition of "low calorie." Because the current definition of 40 calories per serving is sufficiently close to this calculated amount of 47 calories per serving, FDA tentatively concludes that it is not necessary to alter the long-established criterion of 40 calories per serving. Therefore, FDA is proposing in § 101.60(b)(2)(i) to retain the definition of a "low calorie" food as a food containing 40 calories or less per serving.

The agency continues to believe that the inclusion of a weight-based criterion in the definition of "low calorie" is appropriate and prevents claims from being misleading to consumers. However, as originally stated in the **Federal Register** of September 22, 1978 (43 FR 43248 at 43250), the agency believes that although sugar substitutes would not meet the weight-based criterion, they should continue to be excluded from this criterion.

Sugar substitutes contain calories. In fact, many contain more than 40 calories per 100 g. However, they have considerably less weight per degree of sweetness than sugars. Consequently a considerably smaller amount of sugar substitute than sugar may be used and still provide the same degree of sweetness. Because sugar substitutes are used on a sweetness rather than a weight basis, FDA believes that a weight based criterion is not appropriate for these foods. Such a criterion would mean that sugar substitutes could not make low calorie claims even though they are frequently used as ingredients in low calorie foods. By continuing to not require sugar substitutes to meet the 40 calories per 100 g requirement, sugar substitutes can continue to be labeled as "low calorie." Therefore, FDA is proposing in § 101.60(b)(2)(i) for the term "low calorie" to provide that, in addition to containing no more than 40 calories per serving, such foods, except for sugar substitutes, must contain no more than 40 calories per 100 g of food.

3. "High" and "Source"

a. *Background.* The agency considered several approaches for defining terms useful in making nutrient content claims to emphasize the presence of a nutrient. Earlier, in response to the increased use of descriptive terms as part of shelf-labeling programs in supermarkets, the agency had suggested definitions for the terms "source," "good source," and "excellent source" (Ref. 9). The agency defined these terms as providing 10 percent or more, 25 percent or more, and 40 percent or more of the U.S. RDA, respectively, per serving of food, and in the case of dietary fiber, 2 g or more, 5 g or more, and 8 g or more, respectively, per serving of food.

The report from the IOM Committee on nutrition labeling (Ref. 5) favored a system in which vitamins and minerals, when listed on the label, would be described qualitatively using words rather than quantitatively using numbers or percentages of the U.S. RDA. However, the committee did not specifically address the need for criteria for nutrient content claims.

While FDA is proposing to retain quantitative listings of nutrients in the nutrition label, the agency believes that there is merit in the IOM Committee's recommendations concerning the use of certain descriptive terms, especially when used for nutrient content claims intended to emphasize the presence of a nutrient.

The IOM Committee suggested definitions for the terms "contain," "good source of," and "very good source of." However, it commented that the term "excellent source" would provide an unintended incentive for unnecessary vitamin and mineral fortification. In addition, the IOM Committee's review of the vitamin and mineral content of a variety of foods indicated that very few foods would be eligible to use the term "excellent source" as currently defined by FDA, even though many of the foods are recognized as important sources of specific nutrients. The IOM Committee further pointed out that most vitamins and minerals do not occur naturally at high levels in any one food. The IOM Committee's report stated that an adequate diet must be assembled from a variety of different foods, and it emphasized that such a varied diet was the type of dietary pattern that food labeling should encourage. The IOM Committee recommended that FDA definitions of descriptive terms should be based on more "modest" definitions than the 40 percent of U.S. RDA

currently used to define the term "excellent source."

The agency agrees that consumers should be encouraged to consume a wide variety of foods. The agency also believes that the criteria for descriptive terms should be consistent with the levels of nutrients occurring naturally in foods, and that definitions for terms should allow for a reasonable number of foods to make the claim. For these reasons, the agency does not believe that descriptive terms such as "high" can be considered useful to consumers if they can identify only very few foods or only specially formulated foods. Such criteria could discourage the consumption of a wide variety of foods. Furthermore, the use of criteria that take into account the amounts of nutrients occurring naturally in foods is in line with the recommendations provided in "Nutrition and Your Health: Dietary Guidelines for Americans" issued jointly by DHHS and USDA (Ref. 1). Those recommendations emphasize the need to select a diet from a wide variety of foods and to obtain specific nutrients from a variety of foods rather than from a few highly fortified foods or supplements.

b. *How definitions of "high" and "source" were derived for nutrients.* As directed by the 1990 amendments (section 3(b)(1)(A)(iii)(VI)), FDA is proposing to define the term "high" for use in nutrient content claims. The agency is proposing in § 101.54(b)(1) that the term "high" may be used when a serving of the food contains 20 percent or more of the proposed RDI or the proposed DRV. The agency is also proposing in § 101.54(c)(1) that the term "source" unmodified by an adjective may be used to describe a food when a serving of the food contains 10 to 19 percent of the RDI or the DRV.

The use of 20 percent or more of the proposed reference value as a standard for the presence of upper levels of a nutrient (i.e., "high") is generally consistent with the IOM Committee recommendation for "very good source" for vitamins and minerals. The IOM Committee stated that a criterion of more than 20 percent of the reference value would encompass a sufficient number of items in the food supply to ensure that the use of the criterion would encourage consumers to select a varied diet (Ref. 5).

In evaluating the appropriateness of the criterion of 20 percent or more of the RDI or DRV as the basis for the definition of "high," FDA used its Regulatory Food Composition Data Base to examine the types of foods that contain nutrients at levels that meet or surpass 20 percent of the proposed reference value (Ref. 36). Sixteen nutrients with RDIs and one with a DRV (i.e., potassium) were considered in this analysis. Other nutrients with RDIs or DRVs were excluded either because the agency is not proposing to define "high" for these nutrients (e.g., fat), or because the nutrients values in the data base were absent or insufficient (i.e., missing values for more than 25 percent of the foods). For the majority of the 17 nutrients considered, at least 10 percent of the foods in the data base contain 20 percent or more of the RDI or DRV (i.e., the proposed definition for "high"). For these nutrients there was at least one and often more than one food category that contained a substantial number of foods containing 20 percent or more of the RDI or DRV.

Those nutrients for which fewer than 10 percent of the foods in the data base contain 20 percent or more of the RDI or DRV were calcium, magnesium, copper, manganese, potassium, pantothenic acid, and vitamin A. However, even with these nutrients (with the exception of potassium), there was a substantial number of foods in at least one food category that would qualify for "high" claim if the proposed definition were used. Thus, based on this evaluation, the agency agrees with the IOM Committee's conclusion that this criterion would permit a sufficient number of food items to allow consumers to use the claim in selecting a varied diet. Therefore, the agency tentatively concludes that a criterion of 20 percent or more the RDI or DRV provides an appropriate basis for upper-level content claims and can readily be used by consumers to implement current dietary guidelines.

While the IOM Committee has suggested the use of the term "very good source" for levels above 20 percent of the label reference value, the agency is proposing to define this level as "high" to be consistent with the 1990 amendments. Additionally, while the IOM Committee suggested a definition of more than 20 percent of the reference value, FDA has tentatively concluded that a definition of 20 percent or more is more consistent with the agency's approach of defining the term "low" in that the definition includes the integer. The inclusion of the integer makes little practical difference in terms of the types and numbers of foods omitted or included (Ref. 37).

As discussed previously, the agency is concerned that the use of many descriptive terms could overburden consumers and result in consumer confusion or frustration. The agency believes, for example, that allowing the terms "rich" and "high" to describe two different levels of a beneficial ingredient, would be confusing and misleading to consumers who could reasonably be expected to have difficulty distinguishing "rich" from "high."

While the 1990 amendments specify that FDA should define the term "high," the statute does not preclude the agency from defining other appropriate terms for making nutrient content claims to emphasize the presence of a nutrient. The agency is concerned that the use of only the term "high" will encourage persons to focus their attention solely on foods "high" in nutrients, when, in fact, a healthy diet can include a range of foods that are not necessarily "high" in a particular nutrient. Therefore, to expand the number of foods to which consumers' attention may be drawn and from which consumers are encouraged to select and still be likely to meet dietary recommendations, FDA is proposing to define the term "source" unmodified by an adjective.

FDA believes that it is appropriate and beneficial to consumers to allow the use of this term, which characterizes a mid-range of nutrient content. In defining the term "source," FDA intends to allow food manufacturers and retailers to make a nutrient content claim for a food that provides a significant amount of the nutrient in a serving of the food but for which the nutrient level cannot be described as "high." FDA believes that this information will be helpful to consumers in selecting a healthy and nutritious diet.

The agency is proposing that for a food to be considered to be a "source" of a nutrient, the food must contain 10 to 19 percent of the proposed RDI or DRV per serving. FDA believes that a criterion of 10 to 19 percent is consistent with the criterion 11 to 20 percent of the RDI or DRV suggested by the IOM Committee for the term "good source of," a term intended to reflect a mid-range of nutrient content. The proposed definition of "source" is also consistent with the agency's suggestion that, for the purposes of grocery store shelf-labeling, the term "source" could be used when a serving of the food contains 10 percent or more of the U.S. RDA of the featured substance (Ref. 31). Consequently, the term "source," used to denote that a food contains at least 10 percent of the RDI or DRV of a nutrient, has been introduced to, and used by, consumers in grocery-store shelf-labeling and is likely to be familiar to them.

FDA is not proposing to define the term "contains," such as "contains vitamin C" or "contains fiber." While the IOM Committee has proposed the

use of the term "contains," this recommendation was made in the context of describing, on the nutrition label, the levels of nutrients in a food in lieu of use of percentages of the U.S. RDA. The IOM Committee's system of terminology, therefore, represented a descriptive scheme that graded the levels of nutrients from upper to lower levels.

The agency is concerned that consumers would not be able to distinguish easily between "source" and "contains" when used as nutrient content claims, and that consumers would find these terms confusing. More importantly, the agency believes that for the purposes of nutrient content claims, the use of "high" and "source" provides appropriate opportunities to call attention to the positive aspects of the nutrient content of foods, and that these terms adequately reflect levels of nutrients in foods that can be especially useful to consumers in planning overall diets. Furthermore, the agency has long held that levels of nutrients of less than 10 percent of the US RDA could not be used as content claims because current nutrition labeling regulations prohibit claims that a food is a significant source of a nutrient when the nutrient is present in the food at a level of less than 10 percent of the US RDA per serving. FDA is unaware of evidence suggesting that the policy should be changed and therefore is not proposing a descriptive term for nutrient levels of less than 10 percent of the RDI or DRV per serving.

FDA recognizes that limiting defined descriptors to "high" and "source" for the purpose of emphasizing the positive aspects of the presence of a nutrient is a change from previous agency guidance which permitted the use of the terms "excellent source," "good source," and "source," and that Canadian guidelines also permit a variety of such terms (Ref. 38). The agency, however, has tentatively concluded that limiting the number of descriptors will assist consumer understanding of, as well as confidence in, nutrient content claims by providing for consistent, clear, and limited messages concerning the presence (or absence) of nutrients in foods. The agency requests comments concerning its approach and whether an additional term describing an upper level amount of a nutrient (such as "very high") is necessary and appropriate.

However, the agency is proposing to include synonyms for the two defined terms. FDA is proposing to allow the use of "rich in" and "a major source of" as synonyms for "high." It is also proposing to allow the terms "good source of" and "important source of" as synonyms for "source." FDA is including these synonyms to provide some flexibility in the use of these terms.

FDA recognizes, however, that this aspect of the proposal may be controversial. Concerns about the use of synonyms for terms like "high" and "source" have been raised by IOM and the IUNS Committee (Ref. 10). The IUNS Committee questioned the wisdom of more detailed descriptors because of the difficulties for the consumer in understanding a plethora of such terms (Ref. 10). FDA requests comments on this issue and on consumer understanding of the terms that it has proposed as synonyms for "high" and "source."

c. *"High" and "source" not defined for total carbohydrate and unsaturated fatty acids.* FDA has tentatively concluded that definitions for "high" and "source" for the nutrients total carbohydrate, including complex carbohydrates, and unsaturated fatty acids would be misleading. Therefore, FDA is proposing to exclude these nutrients from the coverage of these terms (proposed § 101.54(a)).

In proposing declarations of nutrient content as part of the nutrition label, FDA is proposing to define total carbohydrate as consisting of both complex carbohydrates and sugars. Available consensus reports and current dietary recommendations generally encourage the increased consumption of complex carbohydrates, while suggesting that sugars intake be limited (Refs. 1, 2, and 3). Therefore, a nutrient content claim such as "high in carbohydrate," or "source of carbohydrate," provides misleading dietary advice. At best, the claim is ambiguous in that it does not allow for the distinction between high levels of complex carbohydrates and high levels of sugars.

Furthermore, the agency does not believe that allowing more specific claims relative to levels of carbohydrate in foods, such as "high in complex carbohydrates," can be supported based on recommendations provided in the major consensus reports (Refs. 2 and 3) concerning complex carbohydrate and sugars intake because quantitative recommendations for these nutrients are not provided. Additionally, while the agency has tentatively proposed to require declarations of complex carbohydrates and sugars content on the nutrition label in response to the 1990 amendments, the agency has expressed concern about the appropriateness of including these nutrients. The inclusion of complex carbohydrates and sugars within the mandatory nutrition label may be misleading to consumers because it may suggest that these nutrients have greater public health significance than has been established by existing diet and health studies. In particular, the identification of a specific benefit for complex carbohydrates is confounded by the fact that diets high in complex carbohydrates are usually mixed diets that contain significant amounts of cereal grains, fruits, and vegetables, which are high in fiber, vitamins, and minerals and low in fat (Ref. 2). Thus, the extent to which complex carbohydrates provide a health benefit separate from that provided by the fiber, vitamins, minerals, and reduced level of fat is unclear.

Nutrient content claims concerning "high" amounts of unsaturated fatty acids in foods are problematic for several reasons. Unsaturated fats are comprised of various mono- and polysaturated fatty acids. Different types of unsaturated fatty acids are known to have different effects on health. Some have been shown to lower serum cholesterol levels when substituted for saturated fatty acids (Ref. 3). On the other hand, there is a growing body of evidence suggesting that *trans* isomers of unsaturated fatty acids may be associated with increases in serum cholesterol levels (Ref. 3). The agency has expressed concern about the appropriate definition of unsaturated fatty acids in its supplementary proposal on nutrition labeling. FDA is proposing to provide for voluntary declarations for the amount of unsaturated fatty acids in a food, which would be based on the sum of all polyunsaturated and monounsaturated fatty acids (i.e., both *cis* and *trans* isomers). If claims for "high" unsaturated fatty acids were permitted, *trans* isomers would be included in the level of unsaturated fatty acids reflected in such claims. However, FDA has acknowledged the controversy concerning the inclusion of *trans* isomers in the definition of unsaturated fatty acids. The agency is specifically asking for comments on the appropriateness of including these isomers in the definition for unsaturated fatty acids, given currently available research and public health goals, in the supplementary proposal on mandatory nutrition labeling.

Furthermore, high levels of intake of unsaturated fatty acids, particularly high polysaturated fatty acid intakes, may increase risk of certain cancers (Ref. 2). The NAS report "Diet and Health: Implications for Reducing Chronic Disease Risk" (Ref. 3) recommended that intakes of polyunsaturated fatty

acids not exceed 10 percent of total calories, and that intake be maintained at the current U.S. level, i.e., approximately 7 percent of total calories. Claims for "high unsaturated fatty acids," however, could promote increased intakes of polyunsaturated fats.

Therefore, FDA has tentatively decided not to define the claim "high" for unsaturated fatty acids here. FDA believes that such claims are potentially misleading because there is some evidence suggesting that certain components of unsaturated fatty acids may be associated with the increased risk of certain cancers because current dietary recommendations advise against increases in at least one component of unsaturated fatty acids, and because the current science base has suggested that the benefits of polyunsaturated fatty acids derive not from increased intake but rather from their substitution for saturated fatty acids.

d. *Special requirements for fiber claims for foods not low in fat.* Consistent with section 403(r)(2)(A)(v) of the 1990 amendments, FDA is proposing to require that unless a food meets the definition for "low fat" (i.e., contains 3 g or less of fat per serving and per 100 g of food), as proposed in § 101.62(b)(2) of the companion document on claims for fat, saturated fat, and cholesterol content, the claims "high fiber" or "source of fiber" shall be accompanied by a declaration of the amount of total fat in a serving of the food. Therefore, FDA is proposing in § 101.54(d) that if a claim is made that a food is high in fiber, or is a source of fiber, and the food is not low in total fat as defined in § 101.62(b)(2), then the label must disclose the level of total fat per labeled serving in the referral statement (e.g., "Contains [*X g*] of total fat per serving. See [*nutrition panel*] for nutrition information").

C. Relative Claims

1. Introduction

Among the terms the agency is required by the 1990 amendments to define, unless they are found to be misleading, are "light" (or "lite"), "reduced," and "less" (section 3(b)(1)(A)(iii)(III), (b)(1)(A)(iii)(IV), and (b)(1)(A)(iii)(V), respectively). Claims that include these terms are intended to help guide consumers to foods that may be useful in meeting current dietary recommendations. In addition, these terms provide a basis for comparing the level of a nutrient in one food to its level in another food. The agency refers to these claims as "relative claims" to distinguish them from the "absolute" nutrient content claims using, for example, "low" or "high." However, the term "light" has been used not only as a comparative term to indicate that there is less of a nutrient in this particular food compared to another food, but it has also been used to directly describe a characteristic of the food itself without direct comparisons to another food.

The agency is also proposing to define the circumstances under which the terms "fewer" and "more" may be used. Together with "less," FDA considers "fewer" and "more" to be a subset of relative claims referred to as "comparative claims."

Although there is a certain amount of overlap in the proposed definitions of these terms, the agency is really defining them to create a continuum for "light" claims, to "reduced," and finally to "less," with decreasing rigor in the requirements for use of the terms. FDA's tentative view is that such an approach will limit consumer confusion with respect to the meaning of these terms. However, FDA recognizes that, as an alternative, the terms could be used subject to a single set of definitional requirements, with full disclosure, as part of the claim, of the reference food, the percent the nutrient has been decreased, and the quantitative amount of the nutrient in the labeled food and the reference food. This alternative approach is discussed below in section IV.

2. General Requirements

The general requirements for relative claims, including comparative claims, are set forth in proposed § 101.13(j).

a. *Reference foods.* Relative claims compare the amount or percentage of a nutrient in one product to the level of that nutrient in another food. The agency uses the term "reference food" to denominate the food to which the labeled product is compared. Because a relative claim may be made with respect to a variety of reference foods, FDA believes that for such a claim to be complete and not misleading, the claim must be accompanied by a statement that compares the food for which the claim is made to a specified reference food. This information is important because the amount of a nutrient in a food product, potato chips for example, may vary widely. Some brands or formulations may be relatively low in a nutrient, such as fat, while others are relatively high. Consequently, the declared percentage reduction in a nutrient in a food making a claim will vary depending on the food to which the comparison is made. Conversely, two products showing the same percentage reduction in a nutrient, 25 percent for example, may vary considerably in the absolute amount of the reduction, depending on the product to which each altered food is compared.

The agency believes that a food bearing a relative claim, but not the identity of the reference food, would be misbranded under section 403(a) and 201(n) of the act because a fact material to understanding the significance of the claim would not be revealed. Information about the nature of the modification of the product, which would be essential in judging the usefulness of the product, would not be declared. The agency believes, therefore, that the identity of the food that serves as the basis for the relative claim must be stated on the label.

To ensure that the comparisons made are appropriate, FDA is proposing criteria for selecting reference foods. FDA first developed these criteria in response to comments on its proposal on cholesterol content claims (51 FR 42584, November 25, 1986). These criteria were discussed in the subsequent tentative final rule (55 FR 29456, July 19, 1990). In that document, the agency tentatively concluded that appropriate reference points for "reduced" and comparative claims would be: (1) An industry wide norm, (2) the manufacturer's regular product, or (3) a similar product or class of products as found in a current valid composite data base.

Although FDA is proposing to retain these general points of comparison, the agency considers it necessary to alter the application of these references to accommodate the expanded scope of the descriptors found in this document.

The agency is now proposing an industry-wide norm as a reference point for all relative claims in § 101.13(j)(1)(i). An industry-wide norm takes into account all foods in a particular product class. Consequently, it provides the broadest base and the least opportunity for abuse of any of the reference foods. As defined in the cholesterol tentative final rule, an "industrywide norm" is an average value that is determined by calculating the weighted average of the nutrient in question on a unit or tonnage basis according to the national market share of all foods of the type for which the claim is being made. This concept utilizes national market share information that is readily available to both industry and government. The agency believes that by calculating the industry-wide norm on a unit or weight basis rather than on the basis of dollar sales, the price variability between various brands of similar products (generic or store brand versus national

brands, for example) will not affect the result.

As an example of the calculation for "industry-wide norm," if brand A has a market share of 75 percent and contains 100 mg of cholesterol per 10-ounce (oz) serving, and brand B has a market share of 25 percent and contains 200 mg of cholesterol per 10-oz serving, then the industry-wide norm is 125 mg of cholesterol per 10-oz serving.

FDA is proposing in § 101.13(j)(1)(ii) that reduced and comparative claims may also be made using "a manufacturer's regular product." In the cholesterol tentative final rule, FDA defined this food as a food actually offered for sale to the public on a regular basis for a substantial period of time in the same geographical area, by the same business entity or by one entitled to use its trade name. This criterion will prevent misleading comparisons by precluding a manufacturer from specially formulating a product that is particularly high in a nutrient for limited distribution, for the sole purpose of providing a favorable basis of comparison for another product. A manufacturer's regular product provides a reference to a known specific food and consequently provides a meaningful basis for "reduced" and comparative claims which compare one product directly to another.

Finally, FDA is proposing in § 101.13(j)(1)(iii), for comparative claims only, that a food may also be compared to a similar product or class of products whose compositions are published in a current, valid composite data base, such as the revised sections of USDA's Agriculture Handbook No. 8: "Composition of Foods, Raw, Processed, Prepared" (Ref. 39). By including valid data bases as a basis of comparison, the agency would permit comparative statements based on comparisons of foods within a product class. A product class would include foods for similar dietary uses, i.e., foods that are used interchangeably and have similar product characteristics. For example, this reference point would allow a potato-based snack food to make comparisons with potato chips or with corn chips and a waffle to be compared with a pancake or french toast. This approach would also allow certain new types of products that have a nutritional advantage over existing foods to make a comparative statement. Such a comparative statement might read, for example, "potato puffs, contains 25 percent less fat than potato chips." Because a valid data base, such as USDA's Agriculture Handbook No. 8, (Ref. 39) includes a wide variety of foods within a product category, the agency believes that this reference is inappropriate for "reduced" or "light" claims.

b. *Need for information to accompany claim.* The agency believes that even though terms used in relative claims will be defined by regulation, the claims may be misleading unless they are accompanied by certain material facts that are necessary if consumers are to understand the change that has been made in the food. The agency considers that in the presence of a relative claim: (1) The percent of change in the nutrient level, and (2) the amounts of the nutrient in the labeled food and the reference food are material facts under sections 403(a) and 201(n) of the act.

As will be discussed in detail later, the agency is proposing to permit relative claims on foods based on nutrient differences of 25 percent and above for diminished levels of a nutrient and 10 percent or more of the DRV or RDI for increased levels of a nutrient. Consequently, information about the percent difference in the level of the nutrient between the food and the reference food is necessary for the consumer to evaluate the claim.

Even if a product declares the percent reduction in a particular nutrient compared to the reference food (or the percent more of the DRV or RDI compared to the reference food for "more" claims), the amount of that nutrient in the product relative to the reference food is also necessary information. Information on the amount of nutrient present is necessary for consumers because it provides an additional basis on which they can evaluate the significance of the change, and because it helps them in composing a diet to meet nutritional requirements.

FDA is proposing that statements about the relative amount of a nutrient in the labeled food compared to the reference food state the amount of the nutrient in each food, i.e., "This cheesecake contains 150 calories per serving compared to 200 calories per serving of our regular brand."

As discussed in section II.C. of this document on referral statements, the agency believes that required accompanying information should be in type size no less than one-half the size of the claim. Therefore, consistent with current regulations and proposed requirements for referral statements, the agency is proposing that the required information accompanying a claim about the relative amount of a nutrient be in type no less than one-half the size of the type of the claim but in no case less than one-sixteenth of an inch. One sixteenth of an inch, as discussed above, is the minimum size normally permitted (per § 101.2(c)) for information required on the principal display, or information panel of food labeling.

The agency recognizes that the information that it is proposing to require accompany a relative claim is considerable, but it considers this information necessary to ensure that the claim is not misleading. On the other hand, FDA also recognizes that a requirement that this information be included each time a relative claim is made would overburden the label to the point that the usability of the required information could be diminished. Therefore, the agency believes that the quantitative information required to accompany the claim should be required with only the most prominent declaration of the claim on the food.

Accordingly, based on the foregoing discussion, the agency is proposing in § 101.13(j)(2) that for foods bearing relative claims, the label must bear immediately adjacent to a relative claim in the most prominent location on the label, and in type no less than one-half the size of the type in the claim but in no case less than one-sixteenth of an inch, the following information: (1) The identity of the reference food, (2) the percentage by which the amount of the nutrient in the food differs from the amount in the reference food, and (3) quantitative information comparing the amount of the subject nutrient in the food per labeled serving with that in the reference food (§ 101.13(j)(2)(i)).

The agency is also proposing that the determination of which use of the claim is in the most prominent location will be made based on the following factors, considered in order: (1) A claim on the principal display panel adjacent to the statement of identity, (2) a claim elsewhere on the principal display panel, (3) a claim on the information panel, or (4) a claim elsewhere on the label or labeling (proposed § 101.13(j)(2)(ii)). These factors are based on the fact that the statement of identity is the most critical information on the package, and that the principal display panel, followed by the information panel, are the most important label panels. In addition, these requirements are reiterated in the appropriate paragraphs for relative claims for the individual nutrients e.g., in § 101.54(e)(1)(iii) for "more" claims, § 101.56(b)(3) for "light" claims, § 101.60(b)(4)(ii) and (b)(5)(ii) for calorie claims, and § 101.61(b)(6)(ii) and (b)(7)(ii) for sodium claims.

c. *Absolute difference in nutrient levels for relative claims with*

decreased levels of nutrients. The agency is concerned that relative claims that highlight a decrease in the amount of a nutrient will be made on products that normally contain only a small amount of that nutrient. In such products, a large percentage reduction would produce only a small change in the actual amount of the nutrient present. For instance, a food containing only 50 calories per serving could be reformulated to contain 35 calories per serving and thereby qualify to use a relative claim when, in fact, the difference of 15 calories cannot be considered of nutritional significance. A claim for such a nutrient content difference would be misleading.

Therefore, the agency believes that an additional criterion that specifies a minimum reduction in the amount of the nutrient is necessary to ensure that manufacturers do not make changes based on inconsequential changes in their products.

Currently, no guideline or definition that can be used for determining the amount of a nutrient in food that can be considered consequential or nutritionally meaningful is available. However, FDA believes that the definition for a "low" claim on a per serving basis should be used as such an amount. The agency considers this level to be appropriate because the amount specified as "low" is not inconsequential relative to the overall intake of the nutrient. A person who chose a diet exclusively of foods that qualified for a "low" claim for a particular nutrient would be expected to consume as much as 50 percent of the recommended levels for that nutrient. Yet, because the definition of "low" is tied to the measurable amount of the nutrient, it is clearly a small amount.

Accordingly, FDA is proposing in § 101.13(j)(2)(iii) that a relative claim for a decreased level of a nutrient may be made on the label or in labeling of a food only if the nutrient content for that nutrient differs from that of the reference food by at least the amount specified in the definition of "low" for that nutrient. Consequently, to bear a relative claim for decreased levels of calories, for example, a food would have to have a decrease from the reference food of more than 40 calories per serving.

3. Reduced

a. *Background.* FDA has recognized the potential dietary benefits of foods that have been fabricated or altered to reduce their nutrient content. FDA regulations, proposed regulations, and guidelines provide for the use of the term "reduced" for content of sodium (21 CFR 101.13(a)(4)), fat [Refs. 3 and 31], cholesterol [55 FR 29456, July 19, 1990], and calories [21 CFR 105.66.[d]). Canadian regulations provide for the use of the term "reduced" for altered foods, specifically for the content of calories (Ref. 32) and carbohydrates (Ref. 33).

In response to the 1989 ANPRM and the public hearings, FDA received a variety of comments concerning the term "reduced." Many supported the use of the term, although a few comments suggested that the term was redundant to the agency's provision for comparative statements, and that the term could be misleading to consumers who would interpret the claim to be synonymous with "low." Several comments stated that there is a need to limit the descriptor to a "significant standard of reduction" or a difference of "nutritional significance" to consumers. Other comments argued that, in defining this term, it is necessary to avoid using unreasonably restrictive criteria that could not be met technologically. These comments stated that such criteria would not provide incentives for alterations in food products. However, the comments generally supported the use of levels such as the 33.3 percent for calories, the 50 percent for fat, and the 75 percent for sodium that FDA has established as the reduction levels. Some comments stated that for consumer ease of understanding, and to provide for industry incentives to reduce nutrients in foods, general use of 33.3 percent for all nutrients was desirable. Other comments supported the use of a 50 percent reduction for all nutrients.

The agency believes that consumers associate the term "reduced" with a beneficial reformulation of the food product, and many comments support this belief. Furthermore, given the considerable increase in public awareness and concern about diet and health, the term is viewed by industry and by public health professionals as being particularly effective in causing consumers to select one product over another. Therefore, FDA agrees that the term should be defined, and that the definition of the term should be limited to reformulations that reflect considerable decreases in the level of the nutrient and that have the potential to result in a significant impact on dietary intake of the nutrient. Moreover, as stated above, section 3(b)(1)(A)(iii)(IV) requires that FDA define this term.

In defining the term "reduced," FDA acknowledges the possibility that consumers could interpret the term to be synonymous with the term "low" but believes that consumer education efforts can help to alleviate the potential confusion. Moreover, the possibility of misinterpretation does not outweigh the potential benefits of encouraging the availability and consumption of foods containing reduced levels of certain nutrients. Furthermore, as described above, the agency is proposing to require declaration of quantitative comparisons both in terms of percent reductions and absolute amount reductions. These proposed provisions should decrease the possibility of consumer misinterpretation of the term "reduced."

FDA is proposing to define "reduced" for the following nutrients: total fat, saturated fat, cholesterol, sodium, and calories. The rationale for defining "reduced fat," "reduced saturated fat," and "reduced cholesterol," and the proposed definitions for these terms, are set forth in the companion document on claims about these nutrients published elsewhere in this issue of the **Federal Register**. FDA tentatively concludes that reduced claims for nutrients other than these five are not appropriate because the reduction of other nutrients in the diet is not identified as being of public health importance in the major consensus reports currently available (Refs. 2 and 3).

b. *How definitions of "reduced" for nutrients were derived.* To justify a "reduced claim" and the consequent emphasis on the fact that a reduction in a nutrient has occurred, FDA believes that there should be a substantial reduction in the amount of nutrient present in the food, which in turn could result in a substantial reduction in the amount of the nutrient in diets of individuals. While there is general agreement that the availability of foods reduced in specific nutrients is beneficial from a public health perspective (Refs. 5 and 46), there are no scientific data available to indicate precisely the extent to which reductions of these nutrients in available foods are needed, nor the extent to which such reductions could affect the diets of individuals. Nonetheless, FDA has developed a general approach to the use of this claim.

In defining "reduced," and what would constitute a substantial reduction in the level of a nutrient in a food, an important consideration is the distribution of the nutrient in the food supply. If a nutrient is provided by all general categories of foods, such as fruits, vegetables, grain products, and dairy products, the nutrient can be considered to be ubiquitous in the food supply. The extent of reduction necessary to justify a "reduced" claim for nutrients that are ubiquitous is likely

to be different than that necessary for nutrients that are found in only some or a few food categories. If the dietary reduction of a nutrient can be spread out over all or most food categories, smaller reductions on a food-by-food basis would be needed to achieve a substantial dietary impact than would be needed if the nutrient is present in only some food categories.

A second important consideration in defining "reduced" is the need to provide a consistent definition for this term for all nutrients, so that consumer education efforts can be more easily implemented. Comments have suggested that consumers will more readily recall the meaning of the term "reduced" if it is limited to one level of reduction, such as one-third or one-half. The agency agrees that consistency in definition is desirable.

Therefore, in developing the general criteria for the use of the term "reduced," the agency considered the level of reduction that would result in a substantial reduction in the nutrient content of foods as well as the need for consistency of terms. In addition, FDA considered two other factors. In response to comments, FDA considered the technological feasibility of reducing levels of nutrients in foods. Finally, in developing these definitions, the agency reviewed the quantitative differences between current levels of intake for these nutrients and recommended levels of intake.

FDA is proposing to define the term "reduced" as a difference of 50 percent for all specified nutrients except calories. The agency has tentatively decided that there are no compelling reasons to change the current definition for "reduced calorie" of a 33.3 percent reduction in calories (§ 105.66(d)(1)(i)). For the other four nutrients, reductions of 50 percent are feasible, even in the case of total fat. Current technology has demonstrated that for many foods, including dairy products, a reduction in total fat of 50 percent or more is achievable (Ref. 40).

In addition to a percentage reduction, FDA is proposing to include an absolute reduction criterion in the definitions for "reduced" for particular nutrients. To bear a "reduced" claim, the food must contain a level of the nutrient that is reduced from that in the reference food by an amount that exceeds the per serving criterion for "low" for that nutrient. FDA explained the basis for its reliance on that criterion in section III.C.2.c. of this document, above.

c. *Reference foods for "reduced" claims.* As discussed above (section III.C.2.a. of this document), FDA is proposing in § 101.13(j)(1) two reference points against which a food can be compared to develop a "reduced" claim that is not false or misleading: (1) An industry-wide norm and (2) a manufacturer's regular product.

The agency believes that these reference points are appropriate for "reduced" claims because they reflect points of comparison that are accurately and consistently quantifiable and that thus can provide a meaningful basis of comparison. An industry wide norm represents a reference point calculated on the basis of all foods of the particular type for which the claim is being made. Likewise, the manufacturer's regular brand, which has been available for sale to the public on a regular basis for a substantial period of time and in the same geographic area by the same business entity or one entitled to use its trade name, provides the consumer with a valued reference point to which they should be familiar.

The agency, however, does not consider the third reference point, i.e., a similar product or class of similar products in a current valid composite data base, to be an appropriate point of reference for comparing "reduced" foods. Such a reference point reflects a much wider variety of products than the other two. The agency believes that "reduced" comparisons should be made to a product or type of product that is most like the product bearing the claim. For example, if a product is labeled as "reduced fat imitation bacon bits," it is claiming that it contains reduced fat when compared to other imitation bacon bits. If such a claim could be made on the basis of a data base of products similar to imitation bacon bits, the data base would likely include a range of products, including bacon. The imitation bacon bits could have reduced fat when compared to the data base but not necessarily any less fat than other imitation bacon bit products. In such circumstances, the claim would clearly be misleading. Thus, FDA believes that comparison to a data base of similar products is not an appropriate basis for a "reduced" claim.

Moreover, particularly as a data base ages, the values in the base may no longer represent the nutrient composition of foods that are on the market. If, for example, all manufacturers have lowered the amount of fat in their products, it would not be appropriate for an individual manufacturer to make a "reduced" claim against the higher value represented by the older average value. By requiring that the comparison be made against an "industry-wide norm" or the manufacturer's regular product, the agency believes that this problem is minimized.

d. *Specific definitions*—i. *Reduced sodium.* FDA is proposing to define "reduced sodium" in § 101.61(b)(6)(i) as a reduction of at least 50 percent and a minimum reduction of more than 140 mg per serving. This definition is different than the current FDA regulation (21 CFR 101.13(a)(4)), which provides that for a food to be labeled "reduced sodium," its level of sodium must be reduced by 75 percent. No weight based criterion is specified in the current regulation.

In its 1984 rule on sodium descriptors (49 FR 15510), FDA stated that it intended the "reduced sodium" descriptor to be reserved for those products in which there has been a very substantial reduction in the level of sodium, and that the feasibility of a 75 percent reduction in sodium had been demonstrated for a few products such as cheese and soups. The agency stated that it did not consider a 75 percent reduction to be too severe, unrealistic, or technologically infeasible.

Few data are available to determine the extent to which foods have been reformulated to meet the current criterion for "reduced sodium." A review of data in FDA's 1988 Food Labeling and Packaging Survey (FLAPS) data base revealed that of the 1,265 foods in the data base, none had "reduced sodium" in their brand name or elsewhere on the label (Ref. 41). Information from a market survey for the period of January to June 1989 (Ref. 42) reveals that about two dozen products from over 222,000 products were recorded as having "reduced sodium" or "reduced salt" in their brand name.

While the results of those surveys may suggest that the current criterion may be too difficult to meet, a firm conclusion cannot be drawn because these surveys are selective and not comprehensive. However, the agency recognizes that a 75 percent reduction in sodium may be too difficult to achieve to provide incentive to the food industry to develop and promote reduced sodium foods. The agency therefore believes that some reduction in this criterion would be appropriate.

One reason to consider a 50 percent reduction as a more appropriate criterion for "reduced sodium" is the desirability of harmonizing the criteria used to define the term "reduced" among the various nutrients. As discussed above, consistency of definition will facilitate education efforts and potentially decrease the level of confusion concerning the overall use of the term. In the companion

document concerning fat, saturated fat, and cholesterol descriptors, FDA is proposing a 50 percent reduction as the definition for "reduced fat," "reduced saturated fat," and "reduced cholesterol."

Furthermore, evidence from FDA's Regulatory Food Composition Data Base (Ref. 35) suggests that while sodium is not ubiquitous in the food supply, it is present in many foods. As a result, there are a large number of potential candidates for a "reduced sodium" claim. While a 50 percent reduction is obviously smaller than a 75 percent reduction, if more manufacturers make reduced sodium foods as a result of this decrease in the criterion, the 50 percent reduction criterion may ultimately be as effective, or more effective, in lowering sodium intake than would be a 75 percent reduction in fewer foods.

Additionally, the agency has estimated that a general reduction of 50 percent in sodium intake is needed to meet current dietary recommendations (Ref. 43). While such an estimate cannot form the basis for defining precisely the necessary level of reduction of a nutrient needed, in the case of sodium it supports that a 50 percent reduction in individual foods is not inconsistent with current public health goals in that the proposed level of reduction in foods corresponds to the apparent need for reduction in the general diet.

FDA is therefore proposing in § 101.61(b)(6) to amend the current regulation for reduced sodium foods (§ 101.13(a)(4)) by establishing 50 percent for "reduced sodium" as a minimum reduction. The agency specifically asks for comments concerning this proposed criterion, its public health impact, and nutritional significance, as well as the extent to which the benefits of consistency among definitions and increased availability of sodium reduced foods should be considered.

The agency is also proposing in § 101.61(b)(6) to limit the use of the term "reduced sodium" to those foods for which the total reduction in sodium levels exceeds 140 mg per serving. As discussed above, this second criterion will prevent "reduced sodium" claims on foods that have undergone inconsequential reductions in sodium levels.

ii. *Reduced calorie.* FDA is proposing in § 101.60(b)(4)(i) to define the term "reduced calorie" as a level of reduction of at least 33⅓ percent and a minimum reduction of 40 calories per serving. This proposed definition is consistent with current agency regulations concerning the use of this term (§ 105.66(d)) but differs from the other current proposed levels of reduction for sodium, total fat, saturated fat, and cholesterol, all of which are proposed to be defined as a reduction of at least a 50 percent for the designated nutrient.

FDA first defined the term "reduced calorie" in 1978 (43 FR 43248). At that time, concerns about the term centered on ensuring that it applied to foods that have special value for reducing or maintaining body weight or caloric intake. The agency had tentatively defined "reduced calorie" as one that had at least a one-third reduction in calories (42 FR 37166). Comments received by the agency generally suggested that a lower number, such as a 25 percent reduction, be used. However, the agency adopted the 33⅓ percent reduction because it is feasible for many foods to achieve such a reduction, and because the agency felt that consumers expect a substantial reduction when "reduced" is used. FDA acknowledged that not all foods could be calorically altered but stated that it was important to have a reasonably large reduction in those that can be altered and that are offered for sale primarily on the basis of their caloric reduction.

Comments received by FDA in response to the 1989 ANPRM and public hearings generally supported the use of the term "reduced calorie." No comments expressed concern that the current level used to define this term was inappropriate. One comment, however, suggested that all terms for "reduced" should be defined as a 25 percent reduction, and one comment suggested that the level of reduction for all relevant nutrients should be one-third.

In arriving at a definition for "reduced calorie," FDA considered that the ubiquity of calories across all food categories suggested that the reduction in calories in each food necessary to achieve an overall reduction of public health significance could be less than that necessary for nutrients such as cholesterol or fat. Additionally, the agency considered the public health recommendations relative to weight control, which stress the desirability of only moderate reductions in calories coupled with an increase in exercise or energy (calorie) expenditure (Refs. 2 and 3).

Diets with a moderate reduction in calories are the most advisable for general use because they present less risk that the intake of essential nutrients will be inadequate when the caloric intake is controlled. A one-third reduction criterion allows a greater variety of nutritious foods to bear claims of usefulness in reducing or maintaining caloric intake or body weight, and variety is important in maintaining the motivation to adhere to a calorie control program. Finally, the agency considered that the current definition of "reduced calorie" has been used for a considerable time without apparent difficulty for manufacturers or consumers.

For these reasons, the agency continues to believe that the percentage reduction specified in its current definition of "reduced calorie" in 21 CFR 105.66(d) is appropriate and that there is no compelling reason to change this criterion. Thus, FDA is proposing to recodify this provision as § 101.60(b)(4). Additionally, as discussed above in section III.C.2.c. of this document, the agency is also proposing that declarations concerning reductions in calories be limited to those foods in which there has been a reduction of more than 40 calories per serving.

4. "Light" or "Lite"

a. *Reduced calorie/reduced fat products.* The 1990 amendments, in section 3(b)(1)(A)(iii)(III), instruct the agency to define the term "light" or "lite." (For purposes of this notice, the term "light" will be used to mean either "light" or "lite.")

The term "light," as it has been used for a number of years, connotes a wide variety of meanings such as low or reduced calorie; reduced in fat, sugar, or sodium; light in weight, texture, or color; and thin or less viscous. However, surveys (Refs. 44 and 45) conducted in 1982 and early 1990 found that consumers (70 percent in 1982 and 69 percent in 1990) believe that the term "light" means that the caloric level has been altered in some manner. The similarities in the consumer responses in these two surveys demonstrate considerable stability in consumer perception of the term "light," even though the extent and variety of uses of this term in food labeling have increased many-fold since 1982.

In addition to being a relative claim that compares a food to another food, the term "light" has been used to directly describe the food itself. Without specifying a reference food, the term "light" has been used to imply that the food bearing the term is somehow better nutritionally than other similar but unspecified foods not bearing the term. In this way it has been used more like the absolute claim "low."

The legislative history reflects this use of "light." It states that "an example of an implied claim * * * would be the statement "lite," which implies that the product is low in some nutrient

(typically calories or fat), but does not say so expressly." (H. Rept. 101-538, *supra*, 19.) When "light" has been used as an implied claim, the consumer has generally not been given any explicit product-to-product comparisons to support the claim. The use of "light" without such comparisons results in a direct statement about the food, suggesting that the food itself was somehow more healthful.

Thus, it is not surprising that "light" appears to have great appeal to consumers. In a 1990 Gallup Poll (Ref. 45) many consumers said that they consume "light" products. Sixty-five percent said they consume "light" cheese, yogurt, and sour cream, and 46 percent said they consume "light" ice cream and frozen desserts. Because a majority of consumers associate "light" with a reduction in calories even though there are other meanings for the term, the potential for misuse of the term is created. For example, the use of the term "light" on a food oil may lead consumers to believe that the product has been reduced in calories or fat, when the term is actually being applied to the food to refer to its color.

Because the term "light" appears to be meaningful to a majority of consumers, and because of the potential for misuse of the term, the agency believes that use of the term must be limited to foods that, compared to other products in their class, contribute substantially to the reduction of calories and fat in the diet. Although FDA currently has no regulations governing the use of "light," the agency believes that its definition should be based primarily on consumers' perception that the word "light" means "reduced" in calories. As discussed above, the agency is proposing to retain the definition of "reduced calorie," currently in § 105.66 (⅓ reduction in the number of calories compared to a reference food) in proposed § 101.60(b)(4)(i). Therefore, the agency is proposing in § 101.56(b)(1) that the terms "light" or "lite" may be used without further qualification to describe a food provided that the food has been specifically formulated or processed to reduce its calorie content by 33⅓ percent or more from the reference food that it resembles and for which it substitutes.

Recently, however, FDA has also allowed the term "light" to be included as part of the name of dairy products that are altered to have, in addition to one-third fewer calories, at least 50 percent less fat, but to otherwise possess the same nutritional properties, as the food for which they substitute. The agency has issued a number of temporary marketing permits allowing manufacturers to test market modified standardized foods on this basis (e.g., "lite sour cream"—55 FR 12736, April 5, 1990; "light ice cream"—55 FR 3772, February 5, 1990 and "light egg nog"—55 FR 46998, November 8, 1990.)

Because manufacturers of high fat products, such as sour cream and egg nog, have petitioned FDA to use the term "light" to describe the altered versions of their products, and because other normally high fat products, such as cheese foods, are currently using the term "light," the agency believes that it is necessary to establish criteria for use of the word "light" on altered products that substitute for foods that normally contain relatively high amounts of fat.

The agency believes, however, that it would be misleading to permit the term "light" to be used on a product that normally contains relatively high levels of fat and in which the fat has been reduced but not the calories. As the research discussed above shows, consumers expect a "light" product to primarily be reduced in calories. Therefore, FDA is proposing that for a food in which fat contributes 50 percent or more of the calories to bear the term "light," it must be reduced both in calories and in fat by the percentage of nutrients that would allow the food, for both calories and for fat, to bear the term "reduced" (i.e., 33⅓ and 50 percent respectively). The agency selected 50 percent of calories from fat as the point at which the fat content contributes so significantly to the calorie level in the food (i.e., half) that the fat level must be reduced along with the calorie level to justify a "light" claim.

Consequently, the agency is proposing in § 101.56(b)(2) that a food that derives more that 50 percent of its calories from fat may use the term "light" or "lite" provided that, in addition to the caloric content being reduced by 33⅓ percent, its fat content is reduced by 50 percent or more compared to the reference food that it resembles or for which it substitutes.

It has been suggested as an alternative, rather than to prohibit a "light" claim on a product containing more than half of its calories from fat that has not been reduced also by 50 percent in fat, that such product should bear some type of statement informing the consumer that the product was not reduced in fat. Such a statement might be "Contains X percent fat," or "Contains X percent calories from fat." Would it be misleading to call such a product "light" without the defined fat reduction? The agency requests comments about this approach and about what statement might be required. For the claim to not be misleading, such a disclosure statement would need to be prominent and immediately adjacent to the claim each time it is made.

As with "reduced" foods, so as not to allow nutrient content claims for reductions in foods that are inconsequential, the agency believes that a minimum reduction in calories and, where appropriate, fat should be required to justify an unqualified "light" claim. Consistent with the proposed requirements for "reduced calorie" and "reduced fat" claims, the agency believes that these minimum reductions should be more than 40 calories and 3 g of fat. The agency is proposing this minimum reduction in § 101.56 (b)(1) and (b)(2).

Also, as with "reduced" foods, the agency considered what types of products would be appropriate as reference foods for "light" claims. Because a "light" claim is really two "reduced" claims, it would seem possible to make "light" claims on the basis of the same reference foods as "reduced" claims. However, FDA's experience with foods presently on the market that bear "light" claims has led it to tentatively conclude that for "light" claims, comparisons to a single food in the product class (i.e., the manufacturer's own brand) may be misleading. This is particularly the case if the reference food differs significantly from the norm for the product class and contains the nutrient at a level that is at the high end of the range for the product class.

An example of a food with respect to which a comparison with a manufacturer's own brand could be misleading is chocolate chip cookies. An informal label survey (Ref. 58) revealed a wide variety of fat and calorie levels on a per serving basis for an equally wide variety of chocolate chip cookies. In fact, using the criteria from the serving size proposal published elsewhere in this issue of the Federal Register, even two chocolate chip cookies from the same manufacturer were found to differ widely in their fat and calorie content. A serving of one variety of chocolate chip cookies (two ½ ounce cookies) contained 100 calories and 4 g of fat, while the same size serving of another variety contained 180 calories and 10 g of fat. Clearly comparison with either cookie could result in vastly different claims. Consequently, the agency believes that the manufacturer's own brand may be misleading as a reference food for "light" products, and the agency is not

proposing the manufacturer's own brand as an appropriate reference food.

Therefore, because of the potential for abuse of this term, FDA is proposing that the reference food for "light" claims be only an industry wide norm as defined in § 101.13(j)(1)(i). The agency, however, solicits comments on this issue.

b. *"Light" sodium products.* Some product labels have used the term "light" to describe the salt or sodium content of the food. Because this use of the term results in "light" being used on foods that have not been reduced in calories, the agency considers that this use could be misleading. Therefore, FDA believes that the term "light" should not be used on products solely in reference to their sodium content. Accordingly, the agency is proposing in § 101.56(c) that a product other than a salt substitute that is low, reduced, or otherwise altered in sodium content cannot use the term "light" solely because of this alteration but rather must use, as appropriate, the terms "reduced sodium" or "low sodium."

Although the agency is proposing that the primary basis for the definition of "light" should be a reduction in calories, and that all other unqualified uses of the term are not permitted, the agency believes that the definition for "light" as used with salt substitutes can be viewed differently. Salt substitutes are offered for sale as products that contain virtually no calories. Because a salt substitute clearly contains no calories, a "light" claim would not imply that such a product has been reduced in calories and would not be misleading. In addition, salt substitutes that use the term "light" have been on the market for a number of years, and consumers have become familiar with, and understand, the concept of "light" salt as being reduced in sodium. Therefore, the agency is proposing to permit "light" to be used on salt substitutes that contain at least 50 percent less sodium than table salt. This proposed use of the term is consistent with the approach used for defining "reduced sodium." Accordingly, the agency proposes in § 101.56(d) that the term "light" may be used to describe a salt substitute if the sodium content of the product has been reduced by at least 50 percent compared to table salt.

However, because these salt substitutes may contain significant amounts of sodium, the resulting product may not meet the definition for a low sodium food. The agency therefore invites comments on the use of "light" for these products.

c. *Other uses of the word "light."* As stated previously, the use of the word "light" on food labels generally means reduced calories. However, in some cases it has been used to convey other meanings. The agency believes that the unqualified use of the term may mislead consumers into believing that a food is reduced in calories when this term is actually used to refer to properties of the food other than calories. Consequently, the agency believes that unqualified use of the term "light" when not referring to calories (or sodium in the limited circumstances discussed above) should be prohibited.

If the term is meant by the manufacturer to refer to an organoleptic or other quality, such as texture, color, flavor, weight, or density, all of which may be a logical basis for the use of the term "light," FDA believes that that fact must be clearly and plainly conveyed on the label. For example, the label may state "light in color," "light in texture," or use other terms that clearly convey the nature of the product. In addition, so as not to give undue prominence to the term "light" in relation to the term it modifies, FDA is proposing that this qualifying information be in the same type size, style, color, and prominence as, and in immediate proximity to, the word "light."

Therefore, the agency is proposing in § 101.56(e) that the term "light" may not be used to refer to a food that is not reduced ln calories by ⅓ and, if applicable, in fat by 50 percent, unless: (1) It describes some physical or organoleptic attribute of the food, such as color or texture, and the qualifying information (e.g., light in color, light in texture), so stated, clearly conveys the nature of the product, and (2) the qualifying information is in the same type size, style, color and prominence as the word "light" and in immediate proximity thereto.

The agency recognizes that there are some long standing uses of the term "light" to characterize the particular nature of the product or distinguish it from a similar product with slightly different attributes. Examples of such products are light corn syrup as opposed to dark corn syrup, light brown sugar as opposed to dark brown sugar, and light molasses as opposed to dark molasses. Such light products are generally recognized to be both lighter in color and in flavor (i.e., less intense or more delicate) than their darker counterpart. The agency considers that the long standing use of the term "light" on these few products, whose special "light" characteristics are commonly understood, is sufficient reason to permit their continued use.

Therefore, FDA is proposing in § 101.56(f) that in those rare cases where the word "light" has come, through common use, to be part of the statement of identity, the agency will not require that statements of identity for such products be further characterized. If this provision is adopted, light brown sugar will not be required to be labeled "light color brown sugar" or otherwise meet the requirements for nutrient content claims. The agency is proposing in § 101.52(f) that if a manufacturer can demonstrate that the word "light" has been associated, through common use, with a particular food (e.g., "light brown sugar," "light corn syrup," or "light molasses)" to the point where it has become part of the statement of identity, such use of the term "light" will not be considered a nutrient content claim subject to the requirement as specified in part 101.

FDA specifically asks for comments as to whether the approach to the term "light" outlined in this document is adequate to eliminate the misuse of this term.

5. Comparative Claims

a. *Less or fewer.* The agency recognizes that there are some foods that can achieve meaningful reductions in the level of certain nutrients but for which reductions of ⅓ of calories or 50 percent or greater for nutrients are not feasible. While these foods cannot bear a "reduced" claim, the agency believes that such foods should be permitted to be labeled with comparative statements using the term "less" or, because it is grammatically correct, "fewer" in the case of calories, that specify the extent to which the nutrient has been reduced. For example, the label of a pound cake could bear the statement, "25 percent fewer calories than our regular pound cake—this pound cake contains 150 calories compared to 200 calories per serving in our regular brand." The agency believes that the use of comparative claims provides manufacturers with an incentive to lower the nutrient content of a food even though it may not be technologically possible to achieve nutrient levels that are sufficiently low to allow the product to be labeled as "reduced."

To ensure, however, that the reductions are nutritionally meaningful, and that consumers are not misled by claims for reductions that are inconsequential, the agency believes that a comparative statement should be permitted on the label or in labeling of a food only if the food has been formulated or processed so that it contains a decrease in the level of the nutrient that is 25 percent or more compared to the reference food. This

requirement is consistent with the agency's current policy for comparative claims for sodium (49 FR 15521, April 18, 1984) and the tentative final regulation for cholesterol (55 FR 29456).

The proposed 25 percent reduction requirement is based on agency findings in those notices that products in which there has been a 25 percent or greater reduction in the amount of a nutrient will serve a useful role in the diet of those individuals who are attempting to limit their consumption of that nutrient. In addition, the agency made the finding in the 1984 sodium notice that because of variations in nutrient content within a food or class of food, any less of a reduction, such as the 10 percent that was originally proposed for sodium, would not always assure that the altered product contained less of the nutrient than the regular product. Improvements in food technology or other factors may make it practicable for manufacturers to measure reductions in nutrient content of less than 25 percent. The agency solicits comments, including data, on whether 25 percent is necessary as a minimum reduction requirement for all foods, or whether a lower level is possible. However, FDA acknowledges that permitting comparative claims for foods with a percentage reduction of less than 25 percent may serve to facilitate consumers' efforts to improve these diets if such claims are reliable, and the absolute reduction referred to by the comparative claim is nutritionally significant. This alternative will also be discussed in the supplemental NPRM referenced in section IV above.

Currently, Canadian guidelines and regulations provide for comparisons when differences are at least 25 percent (Ref. 38). This criterion is also consistent with USDA guidelines that permit comparative fat claims for meat and poultry products when fat is reduced by 25 percent or more (Ref. 46).

In addition, so that the reductions are nutritionally consequential, as with "reduced," the agency is proposing that the minimum reduction for comparative claims be more than the value of "low" for that nutrient. Although the reduction in the amount of a nutrient is less for a comparative claim than for a "reduced" claim, it is still important that the reduction be of nutritional consequence. There is no basis to find that a decrease in the level of a nutrient smaller than the amount necessary to justify a "low" claim would be consequential. Therefore, FDA is proposing to require the same minimum quantitative decrease in a nutrient for a "less" claim as for a "reduced" claim.

i. *Sodium.* In the preamble to the final rule on sodium descriptors (49 FR 15510 at 15521), the agency stated that a minimum sodium reduction of 25 percent was necessary for a product to make a comparative statement about sodium. This guidance was not codified in the regulation, but it did serve as the basis, as discussed above, for sodium claims using the term "less." The agency sees no reason why the requirements for use of the term "less" in describing the level of sodium in a product should be any different than those proposed for the other nutrients. The proposed definition for "reduced sodium" is in accord with the definitions for "reduced" for all other nutrients except calories. Moreover, such an approach is in line with the agency's goal of making the definitions for the various terms as consistent as possible to help prevent consumer confusion.

As discussed above, the agency is also proposing that the minimum amount by which a nutrient must be reduced for a food to bear the term "less" should be more than the value of "low" sodium, i.e., 140 mg per serving.

Therefore, the agency in proposing in § 101.61(b)(7) that a comparative claim using the term "less" may be used to describe the sodium content of a food provided that: (1) the food has been formulated or processed to reduce its sodium content by 25 percent or more with a minimum reduction of more than 140 mg per serving from the reference food that it resembles and for which it substitutes as specified in § 101.13(j)(1)(i), (j)(1)(ii), or (j)(1)(iii); and (2) the food meets the requirements of § 101.13(j)(2).

ii. *Calories.* The agency believes that comparative statements should be permitted when the level of calories in a food is reduced by 25 percent compared to a reference food, even though there is only an 8 percentage point difference between the levels at which a "reduced calorie" claim and a comparative statement may be made. Permitting comparative claims will allow claims to be made about the decrease in calorie levels in foods that cannot meet the "reduced" criterion because of technological or other reasons. The agency believes that it is important to provide for comparative labeling for these foods because of the nutritional benefit that such foods can contribute to the diet. If a person who generally consumed a diet containing a normal amount of calories, i.e., 2,350, were to consume a diet consisting solely of foods decreased in calories by 25 percent, he or she could achieve a significant weight loss.

In addition, as discussed above, in order to prevent comparative claims being made for calorie reductions that are inconsequential, the agency believes that, as with all other nutrients, a minimum quantitative reduction should be established. This criterion, if adopted, will ensure that the reduction is nutritionally consequential. Consistent with the requirements for the various nutrients, the agency believes that this value should be more than 40 calories (the level set for "low" calories) per serving.

Therefore, the agency is proposing in 101.60(b)(5) that a comparative claim using the term "fewer" may be used to describe the caloric content of a food provided that: (1) The food contains at least 25 percent fewer calories, with a minimum reduction of more than 40 calories per serving from the reference food that it resembles and for which it substitutes as specified in § 101.13(j)(1)(i), (j)(1)(ii), or (j)(1)(iii); and (2) the food meets the requirement of § 101.13(j)(2).

However, because there is only an 8 percentage point difference between the lower level of calories for "light" and "reduced" (33⅓ percent) versus comparative claims (25 percent), the agency solicits comments on the usefulness of allowing comparative claims in addition to "reduced" and "light" claims for calories.

iii. *Sugars.* Although the terms low or reduced sugars have not been defined, the agency believes that a term that highlights a difference in the amount of sugars in a product relative to another food would assist consumers in following the dietary guidelines relative to sugar. The agency believes that the term "less" may be useful in providing this information.

The agency can see no reason to define a comparative value for "less" to be used with sugars that is different from the value for "less" for the nutrients previously defined. Therefore, the agency is proposing in § 101.60(c)(4) that a comparative claim using the term "less" may be used to describe the sugars content of a food relative to the amount of sugars in another food provided that the food contains at least 25 percent less sugars than the food to which it is compared.

However, because the agency has not established a DRV for sugars, it does not have a basis for defining an insignificant amount of sugars to be used as a second criterion. The agency believes that, as for other claims using the term "less," a second criterion establishing a minimum quantitative reduction is necessary and

solicits comments on how such a second criterion might be derived.

The agency, advises however, that regardless of whether any comments provide a suitable basis for a second criterion, that it intends to establish such a criterion to insure that claims of less sugars are not misleading because the decrease in the amount of sugars is nutritionally insignificant.

b. *More.* Although the 1990 amendments do not require that FDA define the term "more," the agency recognizes that there may be instances when a manufacturer could make a statement on the label or in labeling that a food product contains more of a desirable nutrient than is in a reference food. Such claims may be made for food products containing nutrients such as dietary fiber, potassium, protein, vitamins, and minerals. In addition, claims using the term "more" may be useful in certain limited circumstances to describe the level of complex carbohydrates and unsaturated fatty acids.

FDA considers that such claims are currently governed by § 101.9(c)(7)(v), which states, in part, that: "No claim may be made that a food is nutritionally superior to another food unless it contains at least 10 percent more of the U.S. RDA of the claimed nutrient per serving (portion)." In its proposal of July 19, 1990, on mandatory nutrition labeling, the agency retained and expanded this regulatory provision, in proposed § 101.9(c)(11)(iv) (55 FR 29515), to read: "No claim may be made that a food is nutritionally superior to another food unless it contains at least 10 percent more of the RDI for protein, vitamins, or minerals or of the DRV for complex carbohydrates, fiber, unsaturated fatty acids, or potassium or at least 25 percent less on a weight basis for fat, saturated fatty acids, cholesterol, and sodium per serving (portion)." In the supplemental proposal on nutrition labeling, FDA is proposing to delete the above provision from the nutrition labeling regulations because the issue of descriptors used on food labels or in labeling is being dealt with in the present document. The agency feels that the paragraph in question is more appropriately regarded as a general principle governing comparative claims than one relating to nutrition labeling.

After careful consideration, FDA is proposing to retain its existing approach that a food must contain at least 10 percent more of the RDI for protein, vitamins, or minerals or of the DRV for dietary fiber or potassium before a comparative claim using the term "more" would be permitted. The agency is proposing to retain the level of 10 percent more of RDI or DRV for a number of reasons.

First, the difference must be on the basis of the RDI or DRV, rather than on a weight basis, for the relative difference to have dietary significance. For example, consider a product containing 100 mg of calcium. On a weight basis, it would have 10 percent more calcium than a product containing 90 mg and 25 percent more than a product containing 80 mg. However, in terms of the proposed RDI for calcium (900 mg), the three products contain 11, 10, and 9 percent of the RDI, respectively. These differences are dietarily insignificant.

Secondly, there must be at least a 10 percent difference relative to the RDI or DRV before consumers can be assured that there is truly a difference in the foods being compared. This finding is consistent with the agency's proposed definition of "source" discussed elsewhere in this document. A nutrient must be present in a food at a level of at least 10 percent of the RDI or DRV before that food can be designated as a source of the nutrient. Consequently, the agency believes that a nutrient must be present at a level of at least 10 percent more of the RDI or DRV than in the reference food before the food can be designated as a better source of the nutrient. Because of natural variability of nutrients in food, there is a real possibility that the foods being compared would have virtually no difference in nutrient content if values of less than 10 percent of the RDI or DRV were compared. This percent of the DRV or RDI functions similarly to both the first and second criteria for other relative claims because it ensures that the comparison is always meaningful and significant.

Thirdly, the agency considered requiring at least a 25 percent difference relative to the RDI and DRV in the reference foods before permitting comparative claims using the term "more". This level would be somewhat analogous, and symmetrical, with the proposed requirement for comparative claims using the term "less." However, FDA has tentatively rejected this approach because of the agency's concern that a level higher than 10 percent of the DRV or RDI would result in inappropriate fortification of foods in an attempt to make superiority claims.

The agency's policy on appropriate fortification of foods is stated in § 104.20 (21 CFR 104.20). The fundamental objective of that policy is to establish a uniform set of principles that serve as a model for the rational addition of nutrients to foods. In that policy, FDA clearly states its concern that random fortification of foods could result in deceptive or misleading claims for foods. However, to the extent that food does not conflict with § 104.20, the agency believes that a statement using the term "more" can be used to compare the amount of certain specified nutrients in one food to the amount of such nutrients in similar foods.

Therefore, the agency is proposing in § 101.54(e)(1) that a comparative claim using the term "more" may be used to describe the level of protein, vitamins, minerals, dietary fiber, or potassium in a food provided: (1) That the food contains at least 10 percent more of the RDI for protein, vitamins, or minerals or of the DRV for dietary fiber or for potassium than the reference food that it resembles and for which it substitutes; (2) where the claim is based on a nutrient that has been added to the food, that fortification is in conformity with the policy on fortification in § 104.20; and (3) that it meets the requirements of § 101.13(j)(2) except that the percentage (or fraction) that the nutrient varies compared to the reference food should be expressed as a percent of the Daily Value (e.g., "Contains 10 percent more of the Daily Value for fiber than our regular wheat bread. Fiber content has been increased from 1 g to 3.5 g per serving.") Moreover, FDA believes that it is consistent with section 403(r)(2)(A)(v) of the act to require that if a "more" claim is made for fiber, the level of fat be disclosed on the label unless the food meets the definition of "low fat." This type of claim, like a "high" claim, emphasizes the amount of fiber in the food. Therefore, FDA is including "more" claims in the coverage of proposed § 101.54(d).

As discussed earlier, the agency does not believe that claims for specific amounts of carbohydrates (such as "high in complex carbohydrates") can be supported based on dietary recommendations in the major consensus reports because quantitative recommendations for carbohydrate consumption are not included. However, FDA believes that label statements using the term "more" to characterize the relative difference in carbohydrate content of two food products would be useful to consumers, provided that the claim is based only on the difference in complex carbohydrates as defined in § 101.9(c)(6)(i) of the supplementary proposal on mandatory nutrition labeling and not on the levels of other carbohydrates. The agency believes that this is appropriate because the major consensus reports (Refs. 1, 2, 3, and 5) advocate using sugars in moderation but recommend increasing consumption of

foods that contribute complex carbohydrates to the diet. A statement comparing carbohydrate contents of foods that can be used interchangeably in the diet would be useful to consumers in constructing a diet that adheres to the various dietary recommendations.

However, the agency believes that a statement concerning the percent increase in carbohydrate relative to the Daily Value contained in one product as compared to another is misleading because the DRV for carbohydrate is based on total carbohydrate, and under the proposal, the increased content that forms the basis of the claim must be provided by complex carbohydrates only. There is no DRV for complex carbohydrates. Further, mention of the Daily Value may suggest to consumers that this food component has greater public health significance than has been established by existing diet and health studies. Therefore, the agency is proposing in § 101.54(e)(2) that a comparative claim using the term "more" may be used to describe the difference in the level of complex carbohydrates, in two foods, provided that the food that bears the claim contains at least 4 percent more of the DRV for carbohydrates (i.e., 13 g) and that the difference in the level of carbohydrates between foods consists of only complex carbohydrates as defined § 101.9(c)(6)(i).

The agency is proposing 4 percent of the DRV as the criterion for this claim because 10 percent of the DRV for carbohydrates is 32 g, an amount of complex carbohydrate that would be unreasonable to expect to be found in excess of what is present in a reference food. For instance, most ready-to-eat cereals, which are a good source of complex carbohydrates, contain less than 18 g of complex carbohydrates. In fact, the agency is aware that a 4 percent differential may be difficult to reach. However, a lower value, e.g., 2 percent, is associated with definitions for low levels of nutrients and does not seem appropriate. FDA recognizes that the definition it is proposing from past requirements for claims of superiority and requests comments on the public health validity of the change.

In addition, the agency has received several requests urging that it permit claims comparing the amounts of unsaturated fat in products. The guidance provided in the consensus documents (Refs. 1, 2, 3, and 5) is that total fat and saturated fat consumption should be reduced, and that unsaturated fat should not be increased above current consumption levels. Furthermore, some recent data (Refs. 47 and 48) suggest that "trans" fatty acids, which are unsaturated fatty acids, act like saturated fatty acids relative to their effect on blood cholesterol. Additionally, high levels of intake of unsaturated fatty acids, particularly polyunsaturated fatty acids, may increase risk of certain cancers (Ref. 2). For these reasons, as discussed earlier, the agency has tentatively concluded that claims for "high" in unsaturated fatty acids are potentially misleading.

However, FDA believes that label statements using the term "more" to characterize the relative amount of unsaturated fatty acid in two food products would be useful to consumers, provided that the total fat level in the product bearing the claim is not increased above the total fat level in the product of comparison and provided that the level of *trans* fatty acids in the product bearing the claim does not exceed 1 percent of the total fat content. The agency believes that this proposed action is appropriate because the major consensus reports, such as the NAS report "Diet and Health," advocate substituting unsaturated fatty acids for saturated fatty acids as a means of achieving greater health benefit from the diet. However, because all major consensus reports place considerable emphasis on reducing total fat intake, the agency considers it misleading for a product to claim to have more unsaturated fatty acids if the product has more total fat than the food being used for comparison. In addition, because of the recent data suggesting that *trans* fatty acids may act like saturated fat in raising serum cholesterol, the agency believes that it would be misleading for products containing measurable amounts of *trans* fatty acids to bear claims of "more" unsaturated fatty acids. The agency is proposing a limit on *trans* fatty acids of 1 percent of the total fat because the analytical techniques for measuring *trans* fatty acids below that level are not reliable. Further, the agency believes that a reference to the DRV for unsaturated fatty acids on the panel containing the unsaturated fatty acid claims would be misleading because it would imply to consumers that it is a dietary goal for unsaturated fatty acids that should be attained, when in fact it is the consumption of total fat that should be moderated.

For these reasons, the agency is proposing that a food bearing a "more unsaturated fat. claim must contain at least 4 percent more of the DRV for unsaturated fatty acids (i.e., 2 g) than the reference food. The DRV for unsaturated fatty acids, like that for complex carbohydrates, is sufficiently large that the agency has tentatively concluded that it is unreasonable to require a differential of more than 4 percent of the DRV for unsaturated fat to make a claim of "more." Again, comments, including data are requested on the proposed definition of the claim.

Therefore, the agency is proposing in § 101.54(e)(3) that a claim for more unsaturated fatty acids only be permitted on those foods that contain at least 4 percent more of the DRV for unsaturated fat, do not contain more than the reference food, and in which the level of *trans* fatty acids does not exceed 1 percent of total fat. The agency requests specific comment on this issue.

6. Modified

The declarations discussed above for making relative claims do not include terminology that is suitable for use in a statement of identity with a comparative claim in the way that .reduced" and "light. may be used. For example, "25 percent Less Fat Cheese Cake" is awkward.

Consequently, the agency believes that an appropriate term should be proposed for use with comparative claims. Although the agency recognizes that numerous terms may be adequate to convey this information, given the need, as discussed above, for a term that consumers can recognize and understand, FDA is proposing that the term "modified" be used. FDA has chosen this term because it is applicable to both positive and negative alterations in nutrient content, i.e., comparative statements using either terms "more" or "less."

Under proposed § 101.13(k), the term "modified" may be used in the statement of identity of a food that bears a comparative claim that complies with the requirements in Part 101, followed immediately by the name of the nutrient whose content has been altered, e.g., "Modified fat cheese cake." This statement of identity must then be immediately followed by the comparative statement such as "Contains 35 percent less fat than ____," and all other information required in 101.13(j) for comparative claims. This information is necessary because it presents information that is material in light of the "modified" representation. Consumers must be advised of the nutrient modified, the extent of the modification of that nutrient, and the factual basis on which the extent of modification has been calculated. Without this information, the food would be misbranded under sections 201(a) and 403(a) of the act.

D. Use of Descriptors With Meal-type Products

The agency received many comments to the ANPRM and during the public hearings requesting that it define and allow for the use of descriptors for meal-type products. FDA is aware that nutrient content claims are frequently used on such products even though the agency has not developed definitions specific to that use. In its proposed rule on cholesterol descriptors (51 FR 42584 at 42591), FDA acknowledged that it is not reasonable to expect nutrient content claims on meal-type products to meet the same criteria as those used for individual food items. At that time, FDA proposed as a guideline that a meal containing less than 100 mg of cholesterol could be described as a "low cholesterol meal." However, in its tentative final rule on cholesterol descriptors (55 FR 29456), the agency withdrew from this position because there was no clear definition of the term "meal" and asked for further comment.

The GMA submitted a letter to the agency (Ref. 12) in which they suggested that a "meal-type product" be defined as a food that: (1) Makes a significant contribution to the diet by providing at least 200 calories per serving or weighing at least 6 oz per serving; (2) contains ingredients from 2 or more food groups; and (3) is represented as, or is in a form commonly understood to be, a breakfast, lunch, dinner, meal, main dish, entree, or pizza. Under GMA's proposed definition, such representations may be made either by statements or by photographs or vignettes.

FDA finds merit in this 3-part definition and, lacking any other equally-comprehensive definition, is proposing in § 101.13(1) to adopt it with the qualification that the product must contain two of four specified food groups. However, the agency recognizes that, with this definition, there may be a tendency to assume that a level of 200 calories is appropriate for all meals consumed in one day. This assumption would suggest that three meals and a snack provide only 800 calories per day. The agency, however, assumes that some of the meals would contain more than 200 calories, especially if the product contained only two food groups. Such meals might then consist of a 200 calorie 7 ounce main dish and a fruit or vegetable, starch, or dairy product. If these types of products meet this assumption, it will ensure that a minimum daily intake would be greater than 1,000 calories.

The agency requests specific comments on the appropriateness of this definition of a "meal-type product" as well as on the appropriateness of specific amounts (e.g., 200 calories and 6 oz) and specific product types (e.g., "main dish") used as a basis for this definition.

1. Definition of "Free"

FDA is not proposing separate definitions for "free" for meal-type products. The term "free" is an absolute term implying absence of a nutrient. Therefore, whenever a food is labeled "free," whether it is an individual food item or a meal-type product, it would be misleading unless it met the definition for "free" for the particular nutrient that is the subject of the claim.

2. Definition of "Low" and "Very Low"

GMA suggested that for meal-type products, the nutrient descriptor "low" should be defined on the basis of the amount of the nutrient per 100 g of the meal-type product and suggested specific levels for calories (105 calories per 100 g), total fat (3.5 g or less per 100 g), saturated fat (1.2 g or less per 100 g), cholesterol (20 mg or less per 100 g), and sodium (200 mg or less per 100 g) (Ref. 12). FDA has considered these levels in conjunction with its proposed values for nutrient content claims for individual foods (foods as sold separately, not as part of a meal), discussed earlier in this document. With the exception of calories, the suggested values are similar, or identical, on a 100 g basis to the definitions for the various nutrients proposed for individual foods in this document and in the companion proposal on fats, saturated fat, and cholesterol published elsewhere in this issue of the **Federal Register**.

The agency finds merit in defining nutrient content claims for meal-type products on the basis of the amount of the nutrient per 100 g. This approach alleviates the necessity to accommodate variations in serving size for the various types of meals. A review of such products on the market shows that it would allow nutrient content claims on meal-type products that can be used in a diet that is consistent with dietary recommendations set forth in the Dietary Guidelines for Americans (Ref. 1).

FDA believes that it will be beneficial if the agency used the same quantitative amounts except calories per 100 g as the definitions of "low" that it is proposing for individual foods in this and the companion document on fat, saturated fat, and cholesterol claims. Such consistency will assist consumers and health professionals to be able to recall and use these amounts.

Accordingly, FDA is proposing in § 101.61(b)(5) that a "low sodium" claim may be made for a meal-type product that contains 140 mg or less sodium per 100 g of product. The agency is proposing similar definitions for fat, saturated fat, and cholesterol claims in the companion document.

In the case of low calorie claims, FDA is proposing that an individual low calorie food be defined as containing 40 calories or less per serving and per 100 g of food. The agency recognizes that if it applied this criterion on a 100 g basis to meal-type products, the use of "low calorie" claims on meal-type products would essentially be precluded (e.g., a 10 oz meal would have to contain 113 calories or less to bear a "low calorie" claim). Obviously, such a definition would be unrealistic for two reasons: (1) It is unlikely that a reasonably sized balanced meal could be created that contained so few calories and still made a significant contribution to the daily food intake of an individual; and (2) such a meal is consistent with a 400–500 calorie daily diet (i.e., 113 calories X 4 eating occasions), and such very low calorie diets should be followed only under the strict supervision of a physician. Therefore, FDA is not proposing that 40 calories per 100 g be part of the definition for a low calorie meal.

GMA has suggested that a meal-type product be allowed to make a "low calorie" claim if it contains 105 calories or fewer per 100 g of product. This value would allow a 10 oz "low calorie" meal type product to contain 298 calories. This value appears appropriate for the wide diversity of meal-type products (i.e., meals or meal components intended for breakfast, lunch, or dinner which are offered either as a whole meal (three or more components) or as part of a meal (main dish, entree, or pizza). A value of 105 calories for a low calorie meal-type product would allow many FDA-regulated products within this wide variety of meals or portions of meals to make low calorie claims. The U.S.D.A. has conducted a preliminary evaluation of this value for meal-type products containing meat and poultry and found that approximately 40 percent of such products with a brand name that might imply a "low calorie" claim (e.g., "lean") would not be classified as "low calorie" using the 105 calorie per 100 g criterion (Ref. 12a). As stated previously, the agency assumes that, particularly in the case of entrees and main dishes, meal-type products will not be consumed as the single component of a meal but will be supplemented with a fruit or vegetable, starch (e.g., bread or rolls), or

beverage (e.g., milk or juice) to provide a balanced meal. Consequently, the agency believes that this definition for meal-type products is in line with a 1,200 calorie per day diet.

FDA notes that calorie restricted diets often contain 1,200 calories, frequently broken down into three meals and a snack each day (Ref. 49). Under this scenario, meals would be expected to contain approximately 300 to 350 calories (i.e., 900 to 1,050 calories per day as meals and 150 to 300 calories per day as a snack). Accordingly, FDA has tentatively concluded that 105 calories per 100 g is a reasonable definition for a "low calorie" meal-type product and is proposing this value in § 101.60(b)(3). Nevertheless, the agency requests comments on whether consumers would actually consume meal-type products alone, and whether they depend on these products for the major portion of their caloric intake throughout the day. If so, comments are requested on whether the criterion of 105 calories per 100 g of product for low calorie meal type products is too low.

The agency also is concerned, however, about the application of this definition to meals that are atypically large in size within this class of foods. For example, a 16 oz dinner could have 475 calories and meet the definition for "low calorie." Accordingly, FDA is considering the application of upper limits for each nutrient for meal-type products. Comments are requested on the need for such limits and, if needed, where such limits should be drawn and why.

Finally, the agency has proposed a definition of 35 mg of sodium per serving and per 100 g for "very low sodium" in individual foods in § 101.61(b)(3). The agency is uncertain as to whether there needs to be a comparable value for meal-type products, since it could prove very difficult to create a very low sodium meal. Such a definition might be virtually meaningless. On the other hand, FDA does not wish to preclude the use of a definition which might be of value in assisting consumers to choose products that have minimum amounts of sodium if such products are feasible. The agency has tentatively concluded that a definition for "very low sodium" meal-type products would serve some purpose and is consequently proposing such a definition. However, the agency seeks comments on the usefulness and necessity of this definition.

3. Relative Terms

Inasmuch as the primary criterion for the use of relative claims (i.e., "reduced," "light," and comparative claims) is a percent reduction, FDA does not believe that it is necessary to propose different criteria for meal-type products. While acknowledging the difficulty in reducing the calorie, fat, and cholesterol content of meal-type products, FDA believes that the consumer expects significant differences in products bearing these claims and would be best served by adherence to the proposed definitions for individual foods.

The second criterion for the use of relative terms on individual foods is a minimum reduction in amount of nutrient equivalent to the value established for "low" for that nutrient per 100 g. Again, FDA believes that the criterion for individual foods would be appropriate for meal-type products. This requirement will allow the proposed regulations for relative claims on individual foods to apply equally to meal-type products.

a. *Reduced.* The agency is, however, concerned about providing for the use of the term "reduced" with meal-type products because of the difficulty in establishing an appropriate reference food. The proposed definition for "reduced" for individual foods is based on a comparison of a product to another product of the same type, e.g., one cupcake to another. A comparison of meal-type products could be of a broiled fish fillet to a piece of fried, breaded fish. Such a comparison would equate two products that, although they had the same basic ingredient, i.e., fish, were distinct in their method of preparation, additional ingredients, taste, and appearance. Such a comparison would be inappropriate for a "reduced" claim because it would be comparing products that were insufficiently similar to make a valid comparison. The agency is of the opinion that there is an insufficient basis on which to establish a reference criterion, and consequently there is no basis on which to establish a definition for "reduced" meal-type products. Therefore, the agency is not proposing to provide for the use of "reduced" claims on meal-type products.

b. *Comparative claims.* Comparative claims, however, by their very nature provide for comparisons of foods within a product category, provided the basis of comparison is adequately stated in the claim, e.g., comparison of a snack food to another snack food. Comparative claims, using the terms "less," "fewer," and "more," would be appropriate for comparing similar meal-type products such as broiled fish to fried, breaded fish because both of these somewhat dissimilar products would be in the same product category. Therefore, the agency is proposing to incorporate the provisions for comparative claims for meal-type products into the comparative claims provisions in the various nutrient sections.

c. *"Light".* FDA is proposing a more narrow reference food criterion for "light" claims on individual foods than for "reduced" claims. It follows, then, that since the agency is proposing not to permit "reduced" claims on meal-type products, it would do likewise for "light" claims. However, the agency recognizes that there might be some basis to find that an alternative course is appropriate.

The agency believes that the term "light" could be useful to consumers in selecting meal-type products by highlighting products that contain fewer calories than would be expected in a normal meal. Because there is no identified set of reference foods to which "light" meal products could be compared, the agency has considered using a different criterion for the definition of "light" meal-type products. The agency is considering allowing use of the term "light" on meal-type products that meet the criteria for "low calorie" meals. At 105 calories per 100 g or approximately 300 calories per 10 oz portion, the criterion for "low" calorie meals is very nearly one fourth of the intake in a calorie restricted diet of 1,200 calories a day (Ref. 49). The agency believes that such products would meet the consumer's expectations that the food is low or reduced in calories.

In addition, FDA is also considering a second criterion that "light" meal-type products not contain fat, saturated fatty acids, sodium, or cholesterol at a level that exceeds one-fourth of the DRV of the nutrient. This criterion would ensure that light meal-type products would not only be low in calories but would also not contribute amounts of these nutrients that would cause total daily intake to exceed recommended values.

These criteria for the term "light" on meal-type products would permit some meal-type products to bear "light" claims and would ensure that such claims are not misleading. The agency solicits comments on the need to provide for use of "light" on meal-type products and on possible guidelines for selection of reference foods. Comments are also requested regarding this definition "light" meal-type products, including the criterion relative to other nutrients and on possible guidelines for selection of reference foods. If the comments warrant, the agency many propose appropriate definitions and requirements for use of the term "light" for meal-type products.

4. "Source" and "High" Claims

As with the definition for "low" for meal-type products, the agency believes that the criteria for "high" and "source" should be the same percentages of the RDI or DRV proposed as for individual foods but on an amount per 100 g basis, not per serving. Therefore, consistent with these definitions, the agency is proposing in § 101.54(c)(2) that "source" be defined for a meal-type product as 10 to 19 percent of the RDI or DRV per 100 g of product, and in § 101.54(b)(2) that "high" be defined as 20 percent or more of the RDI or DRV per 100 g of product. Consequently, to be considered a "source" of a nutrient, a 10 oz meal-type product would contain 7 to 13.5 g of fiber. (25 g of fiber is the DRV for fiber. 10 to 19 percent of the DRV is 2.5 to 4.75 g. 10 oz × 28.35 g/oz = 284 g. 284/100 g = 2.8 g. 2.5 (10 percent of the DRV) × 2.8 = 7 g; 4.75 × 2.8 = 13.5 g.)

Consistent with section 403(r)(2)(A)(v) of the act, which states that a claim may not state that a food is high in dietary fiber unless the food is low in total fat (as defined in § 101.62(b)), the agency is proposing in § 101.54(d) that claims that a meal-type product contains "more" fiber be required to disclose the level of total fat on a per serving basis.

5. Disclosure Statements

The disclosure levels proposed in § 101.13(h) and discussed above in section II.D. of this document were derived for levels of nutrients found in individual foods. Because the definition of meal-type products encompasses a broad range of products, from entrees that may be a small portion of the total meal to complete meals, the issue of modifying these levels for use with such products become complex. Because of this complexity, the agency was not able to devise specific disclosure levels for use with meal-type products. FDA solicits comments on whether the disclosure levels should be different for meal-type products, and if so, what the levels should be and why.

E. Redesignation of Certain Requirements in Section 105.66 to Section 101.60

Because these proposed regulations on nutrient content claims include provisions similar or identical to some provisions in § 105.66, the agency has found that it is necessary to examine § 105.66 to determine what changes are necessary in that regulation in order to conform it to the 1990 amendments.

As discussed above, FDA is proposing to recodify current § 101.13, Sodium labeling, with minimal revisions, in new Subpart D—Specific Requirements for Nutrient Content Claims, so that it could be codified in close proximity to the requirements for other nutrient content claims. Section 105.66 is not amenable to that approach.

Section 105.66 was originally promulgated to provide regulations for label statements useful on products for reducing or maintaining caloric intake or body weight. Consequently, terms such as "low calorie," "reduced calorie," and "sugar free," which were thought to be useful attributes of a food in the maintenance or reduction of body weight, were included in this section. Over time, more and more people have become concerned with healthier eating and have begun to follow the guidelines established in Dietary Guidelines of Americans (Ref. 1), including the maintenance of a healthy weight. Consequently, terms such as "low" or "reduced calories" and "sugarless" have come to be used on foods intended for consumption by the general population. As such, they have lost their special significance in the labeling of foods intended solely for special dietary uses.

As is discussed elsewhere in this document, these terms are now more appropriately defined under the 1990 amendments as nutrient content claims. Consequently, the agency is proposing to place requirements for terms such as "low" and "reduced calorie," comparative claims, and sugar claims, originally provided for in § 105.66, in § 101.60. Requirements for label statements about nonnutritive sweeteners, "diet" foods, and other related terms are being retained in § 105.66.

Because definitions of terms in proposed § 101.60 would be redundant of certain provisions in § 105.66, the agency is proposing to delete, paragraphs (c), (d), and (f) of § 105.66 and to replace them with statements referring to the appropriate section in 101.60 for criteria for use of the respective term.

In addition, the agency is proposing to delete from § 105.66 any inappropriate reference to specific nutrient content claims or similar terms and any statement that is inconsistent with the 1990 amendments.

There is, however, a significant portion of § 105.66 that remains appropriate for regulating foods that are for special dietary uses. Such foods are those specifically represented or purported to be useful as part of weight control plan, as opposed to those that are simply represented as being low or reduced in calories (although such products can be useful in reducing or maintaining body weight). The agency is retaining those provisions in § 105.66. FDA plans to reexamine the provisions remaining in § 105.66 and to initiate additional rulemaking as appropriate.

In the interim, the agency is proposing to make the following specific changes to the remaining paragraphs in § 105.66: It is proposing to delete the words "caloric intake or" from the title, paragraph (a), paragraph (b)(2) and paragraph (e)(2) of the section because, as stated above, it considers information relative to the caloric content of a food to be of value to the general public in selecting diets that meet dietary guidelines. Consequently, the agency believes that this concept is more consistent with § 101.60 than § 105.66. It is also proposing to delete from paragraph (a) the words "including, but not limited to, any food that bears representations that it is low or reduced in calories" because "low" and "reduced" calories are defined in § 101.60.

FDA is also proposing to delete in § 105.66(a)(2) the phrase "The labeling provided for in paragraph (c) or (d) of this section or," because the terms "low" and "reduced," which were provided for in those paragraphs, are now defined in § 101.60. The agency is not proposing to delete the remainder of the sentence "a conspicuous statement of the basis upon which the food claims to be of special dietary usefulness." The agency cautions, however, that it will not consider reliance on this provision as justification for an undefined nutrient content claim.

In addition, the agency is proposing to delete from § 105.66(e)(1) the phrases "or other such terms representing or suggesting that the food is low calorie or reduced calorie or that the food may make a comparative claim or special dietary usefulness" and "in compliance with paragraph (c) or (d) of this section" because the terms are no longer codified in this section. The agency recognizes, however, that provisions for the terms "diet," "dietetic," "artificially sweetened," or "sweetened with nonnutritive sweetener," may, consequently, not be clear. However, as stated above, the agency intends to reexamine § 105.66, particularly this paragraph, so that it can establish a more cohesive policy regarding foods for special dietary uses. The agency envisions that use of the term "diet," except on soft drinks exempt under section 403(r)(2)(D) of the act, and on products addressed in § 105.66(e)(2), will require that such foods meet the general requirements of § 105.66.

Finally, the agency is proposing to delete § 105.66(e)(3) and include reference to "formulated meal

replacement or other food that is represented to be of special dietary use as a whole meal," in paragraph (e)(1). The agency recognizes that this is a departure from the previous regulation that exempted such foods from paragraph (e)(1) pending issuance of a regulation governing them. However, in order that such claims not be prohibited as implied nutrient content claims under the 1990 amendments, they are being included in paragraph (e)(1) until such time as more appropriate regulations can be issued. FDA views claims that are permitted under § 105.66 to meet the requirements of section 403(r) of the act.

IV. An Alternative Approach to Comparative Nutrient Content Claims

The proposed approach to comparative nutrient content claims discussed in the preceding sections involves the adoption of specific and distinct definitions for such comparative terms as "reduced," "fewer," and "less," including minimum percentage reductions or differences that must be achieved to justify the claim (e.g., a "less" claim requires at least 25 percent less of the nutrient in question). FDA is concerned about whether the terms defined in the various nutrient content claim rules strike the proper balance between allowing an adequate number of terms such that consumers can distinguish the nutrient content across foods and minimizing the proliferation of terms that may tend to confuse consumers. It is possible that the comparative terms FDA proposes to define might still cause confusion, due to the natural vagaries of language, the fact that it will take a significant amount of time before consumers are familiar with the definition of the terms, and the fact that the terms are really only distinguished by the regulatory definition rather than some innately understood differences: In common parlance, "reduced," "fewer," and "less" do not have established, distinct meanings for most consumers as they apply to describing relative levels of nutrients in food.

In addition to avoiding consumer confusion and thus fostering the consumer's ability to select healthier foods, FDA also wants to provide manufacturers maximum flexibility in their use of nutrient content claims, consistent with the goals and requirements of the act. This is consistent with FDA's goal of assuring that the approach to defining nutrient content claims it ultimately adopts provides a clear incentive to manufacturers to produce innovative products that are improved in the nutritional attributes addressed by the comparative nutrient content claims e.g., products that are truly "reduced" in fat or contain "less" cholesterol than the products for which they substitute.

Consequently, FDA solicits comment on a very distinct regulatory approach that in essence defines all comparative nutrient content claims as synonyms and requires a numeric disclosure of the comparative difference. Unlike words, numbers are not as easily manipulated and therefore avoid the confusion of distinctly defined terms. Therefore, a number of terms given identical definitions could be used with conspicuous full disclosure of the percent by which the nutrient has been decreased and a comparison of the quantity of the nutrient in the labeled food and the reference food. For example, the following nutrient claims could be used interchangeably: "____ percent reduced calories," and "____ percent fewer calories," with a disclosure in absolute terms of the comparative amounts (in this example, the number of calories per serving in the labeled food and the number in the food to which it is being compared).

Under this approach, or even as a separate alternative, there would not be any single across-the-board minimum percent of reduction or difference required to support the claim, such as 25 percent, but any claimed reduction or difference in the level of a nutrient would have to be large enough to be considered nutritionally significant in accordance with criteria adopted by FDA.

FDA intends to seriously evaluate these alternatives as part of its continuing effort to devise an optimal approach to nutrient content claims. To facilitate a full airing of the issues, FDA is considering holding a public meeting on nutrient content claims and, within 60 days of the publication of this proposal, the agency will publish a supplemental notice of proposed rulemaking. FDA will then fully evaluate the alternative approach outlined above and the one proposed in this document and by November 8, 1992, FDA will select and adopt as a final rule the approach to comparative nutrient content claims that best achieves the agency's goals of avoiding consumer confusion, empowering consumers to choose healthier diets, and providing incentives for food manufacturers to produce nutritionally improved food products.

V. Petitions for Nutrient Content Claims

Section 403(r)(4) of the act provides that any person may petition the Secretary to make nutrient content claims that are not specifically provided for in FDA's regulations. It describes procedures for petitions that seek to define additional descriptors, to establish synonyms, and to use an implied nutrient content claim in a brand-name.

On March 14, 1991, the agency stated in a notice in the **Federal Register** (56 FR 10906) that it was developing procedural regulations that would prescribe the type of information needed to support each of these three types of petitions, in addition to the other types of petitions permitted by 1990 amendments. The agency stated that the most efficient use of its resources would be to establish these procedures in final form before considering, or acting on, any such petitions. The agency, therefore, advised that it is likely to deny any petition submitted under the 1990 amendments until final procedural regulations are issued. The agency requested information and comments on appropriate requirements for these petitions.

Ten comments pertaining to petitions for nutrient content claims were received from the food industry, industry trade associations, and consumer organizations. The agency has considered the comments, and many of the recommendations made in the comments are incorporated, or were otherwise used, in the development of this section of the proposed rule.

The agency is proposing to codify the procedural requirements for petitions for nutrient content claims in new § 101.69. Because the statute prescribes distinctly different procedures for petitions that relate to nutrient content claims, synonyms for those claims, and implied nutrient content claims in brand names, FDA will treat each separately in the following discussion. In the proposed procedural regulations the Commissioner of Food and Drugs is designated as the official authorized to act on these petitions consistent with the delegation of authority from the Secretary to the Commissioner under 21 CFR 5.10.

The agency is also proposing to amend § 5.61 (21 CFR 5.61) to add paragraph (g) to redelegate to the Director and Deputy Director of the Center for Food Safety and Applied Nutrition, all the functions of the Commissioner concerning petitions for label claims under section 403(r) of the act (i.e., petitions concerning nutrient content claims and health claims) that do not involve controversial issues. Such functions consist of issuing notices that seek comment on a petition; issuing notices of proposed rulemaking and final rules concerning authorized terms

for nutrient content claims; and issuing letters concerning the filing, denial, and granting of a petition. This redelegation is proposed to facilitate timely agency action on these petitions given the short timeframes for agency action imposed by the act.

A. Statutory Provisions

1. Nutrient Content Claim (Descriptor) Petitions

Section 403(r)(4)(A)(i) of the act grants to any person the right to petition the Secretary (and by delegation, FDA) to issue a regulation to define a nutrient content claim that has not been defined in the regulations issued under section 403(r)(2)(a)(i) of the act. The statute requires that such a petition include an explanation of the reasons why the claim that is the subject of the petition meets the requirements of section 403(r) of the act and a summary of the scientific data that support those reasons (section 403(r)(4)(B)) of the act.

These provisions of the act also apply to petitions to the agency to issue a regulation relating to a health claim to be made of a food label. However, because health claims and nutrient content claims are distinct types of claims that convey different types of information to consumers, the specific data requirements to substantiate these two types of petitions will differ significantly. Therefore, the procedural requirements for petitions relating to health claims are proposed separately in a proposal published elsewhere in this issue of the **Federal Register** that addresses the general requirements for health claims for food.

Section 403(r)(4)(A)(i) of the act provides that within 100 days of receipt of a petition for a regulation concerning descriptors, FDA must either issue a final decision denying the petition or file the petition for further action. If FDA denies the petition, it is not made available to the public. If it files the petition, FDA must either deny it or publish a proposed regulation responsive to the petition within 90 days of filing.

2. Synonym Petitions

Section 403(r)(4)(A)(ii) of the act grants to any person the right to petition the Secretary (and by delegation, FDA) for permission to use terms in a nutrient content claim that are consistent (i.e., synonymous) with terms defined in regulations issued under section 403(r)(2)(A)(i) of the act. The statute provides that within 90 days of the submission of a petition, FDA must issue a final decision denying the petition or granting such permission.

3. Brand-Name Petitions

Section 403(r)(4)(A)(iii) of the act also allows petitions requesting use of an implied claim concerning the level of a nutrient in a food in the food's brand name. The claim must not be misleading and must be consistent with the terms defined by FDA by regulations under section 403(r)(2)(A)(i) of the act. The agency is directed in the act to publish notice of an opportunity to comment on the petition in the **Federal Register**, to make the petition available to the public, and to issue a final decision no later than 100 days after the date of submission to grant or to deny the petition. The petition is to be considered granted if the Secretary does not act on it within 100 days.

B. Comments

1. Nutrient Content Claims Petitions

a. *Procedural issues.* Two comments stated that FDA appears to take the position that "free," "low," "light" or "lite," "reduced," "less," and "high" are the only nutrient content claims for which the agency is required to issue regulations within two years after the enactment of the 1990 amendments. The comments disagreed with this interpretation and contended that the congressional intent, and the wording of the 1990 amendments, contemplate a two-track system operating concurrently. The first track consists of establishment (by the agency) of definitions for the above nutrient claims identified in the 1990 amendments. The second track consists of agency consideration of those nutrient descriptors for which petitions are submitted by interested persons.

The comments stated that at no time did Congress indicate that FDA had authority to limit itself to the former and ignore the latter. The comments pointed out that any nutrient content claim that is not the subject of an FDA regulation issued by the effective date of the statute may not be used. The comments stated that as a result of this fact and of FDA's planned course of action, all nutrient content claims not explicitly required by statute to be the subject of a regulation would not be defined and thus could not be used after the effective date of the statute. Therefore, the comments requested that FDA withdraw the statement that it may defer or deny nutrient content claims petitions until it has adopted final procedural regulations and state that all petitions will be handled in the manner required by the new law.

The agency rejects these comments for three reasons. First, as explained in the March 1991 **Federal Register** notice, the 1990 amendments place an extraordinary burden on FDA's resources. FDA has great discretion in determining how its resources can best be used. Not only does the agency lack the resources to handle a large influx of petitions on nutrient content claims, but because the petitions would be submitted before FDA identified the kinds of information that a petition would have to include to substantiate the need for a new descriptor, it is questionable whether the petitions would contain the substantive information needed by the agency to make a decision. Such a situation would likely result in a waste of the agency's resources, as a great deal of effort would need to be spent in looking at inadequate petitions.

Secondly, and most importantly, the nutrient content claims petitions would request regulations that are in addition to or perhaps amendments of the regulations established by the agency in this rulemaking. As the agency stated in the March 14, 1991 notice, it is premature to request amendment of a regulation (by addition or revision) before the regulation is final. The procedural regulations will be made final at the same time as the substantive regulations, and therefore, the agency's procedure for handling petitions before final regulations is appropriate.

Consistent with the most effective use of its resources in pursuing this end, the agency believes that the nutrient content claims that it considers first should be those that are of greatest concern and usefulness to consumers because of their potential to be misleading. The agency is addressing those terms in this proposed rule. The agency notes that in doing so, it has not limited itself to the terms enumerated in section 3(b)(2)(A)(iii) of the 1990 amendments but has proposed to define a number of other terms (e.g., "source" and "more") that are of most significance to consumers.

b. *Evaluation criteria.* Several comments recommended that a nutrient content claim petition include a quantitative definition of the proposed descriptor, and that the definition be supported by data proving that the new term is quantitatively significantly different than those terms defined pursuant to section 403(r)(2)(A)(i) of the act. One comment further recommended that the petitioner be required to explain, using scientific data, why the agency-defined nutrient content claims are inadequate to describe the product's characteristics.

The agency agrees that petitions for nutrient content claims should address

the level of the nutrient that must be present to justify the use of the claim and is proposing to require in § 101.69(m)(1) in format item A that a petitioner specify the level at which a nutrient must be present for the use of the claim to be appropriate. The agency also believes that before it approves any additional claims, it should consider whether such approval would result in the availability of additional useful information to consumers that will enhance their ability to select foods of nutritional value. Therefore, the agency is proposing to require in § 101.69(m)(1) in format item B that the petitioner address what nutritional benefit to the public will derive from the use of the proposed claim, and why such benefit is not available through the use of the existing terms defined by regulation.

Other comments added that scientific or statistical data supporting the accuracy of the term, in and of themselves, are not sufficient, if such studies are not accompanied by broad-based, statistically valid studies demonstrating consumers' understanding of the term.

FDA believes that a petition should demonstrate that consumers will understand the proposed term. However, it does not believe that an extensive database would be required in all cases to substantiate that a proposed term would be understood. Therefore, the agency is proposing in § 101.69(m)(1) in format item C that a petition include data and information that demonstrate that the proposed term will be understood by consumers, but it is not specifying the type or degree of such data.

Another comment suggested that petitions include recommendations from health organizations. Information, including recommendations, from health organizations may be useful in evaluating potential nutrient content claims, and petitioners are free to include such recommendations. However, the agency does not believe that such recommendations should be required for a petition to meet the burden of proof contemplated by the act and is not proposing to require them. In addition, health organizations will be able to participate in the rulemaking process for these petitions by commenting on any proposed regulation issued in response to a petition.

Other comments suggested that in considering nutrient content claim petitions, the agency is required to use the statutory criteria established in section 403 (a) and (r) of the act, and that because these criteria are quite specific, no other elucidation of the statutory provision is necessary or desirable.

While the agency agrees that the statutory provisions cited in the comments, along with section 201(n) of the act, will provide the ultimate standards against which any petitions for additional terms must be judged, it believes that an additional elucidation by regulation is appropriate. The agency believes that by setting forth the kind of showing that will be necessary to justify a claim, it will facilitate the process. As a result the petitions that will be filed will be more focused, and potential petitioners will be able to judge in advance whether submitting a petition would likely be a useless gesture.

2. Synonym Petitions

a. *Procedural issues.* In general, the comments that addressed the procedures to be followed for synonym petitions dealt with four major areas: Publication of a notice of receipt of a synonym petition, opportunity for public comment, publication of the agency's decision, and necessity for codification of the final decision.

One comment stated that under section 403(r)(4)(A)(ii) of the act, there is no statutory requirement for a comment period, and therefore, none should be afforded. Other comments suggested that all petitions received by the agency should be published in the **Federal Register** with a 30-day comment period.

The agency received a similar range of comments on the need to publish a notice of denial of a synonym petition. While some comments argued that there is no need to publish such a notice, others argued that if a petition is denied, publication of this fact would discourage others from petitioning for use of the same term, thereby promoting more efficient use of the agency's resources.

One comment stated that a petition under section 403(r)(4)(A)(ii) requires only a decision by the agency in the nature of an advisory opinion and not the establishment of a regulation. The comment said that only if the petition is granted should notice of availability of the advisory opinion be published in the **Federal Register**. Others felt that it is appropriate that if the petition is granted, the synonymous term should be codified. These comments argued that this approach is consistent with the requirement in the 1990 amendments that all new nutrient content claims be codified. These comments also said that codification will lead to consistency of terms used for the labeling of food and, thereby, better consumer understanding of label statements.

The proposed procedures for agency action on synonyn petitions are discussed below along with the factors that the agency considered in arriving at its tentative positions. Given the very short timeframe established by the act, the agency is proposing neither to solicit public comment on the petition nor to establish regulations for authorized synonyms. However, it intends to publish expeditiously a notice of its decision on the petition.

b. *Evaluation criteria.* Some comments recommended that the agency require petitioners to prove that the ordinary meaning of the term is not misleading and is synonymous with the agencydefined term. Inclusion of consumer surveys or other market research data was recommended to demonstrate that consumers understand the new term to be synonymous with the agency-defined term, and that consumers are not confused by the new term. The comments also stated that the etitioner should be required to show why the existing terms are inadequate.

The agency generally agrees with the views expressed in these comments. It has included provisions in proposed § 101.69(n), the regulation on synonym petitions, that require that the petitioner address these items. This approach would differ under the alternative discussed in section IV above.

3. Brand-Name Petitions

One comment requested that the agency provide adequate time for comment on the notice that it is required to publish in the **Federal Register**. Other comments suggested that the agency consider codifying its decision to grant a brand-name petition, or, if this is not practicable, any final decision by the agency should be made public 30 days before its effective date, so that interested parties can petition for reconsideration.

The proposed procedures for agency action on brand-name petitions are discussed below along with the factors the agency considered in arriving at its tentative positions. FDA is proposing to provide 30 days for comment on the petition and to issue its decision by letter to the petitioner. In addition, the agency intends to announce the approval of a brand name in the **Federal Register**.

C. Proposal

1. Provisions Applicable to All Petitions for Nutrient Content Claims

The agency is proposing to establish § 101.69 as the general procedural regulation for all types of petitions for nutrient content claims. Proposed § 101.69(a) through (l) are general

provisions applicable to all such petitions. Section § 101.69(a) through (f) address general issues, such as how specific types of information can be incorporated into the petition and set forth standard agency requirements pertaining to clinical and nonclinical studies submitted to the agency for review. The agency is proposing in § 101.69(g) that the availability for public disclosure of petitions for nutrient content claims will be governed by the provisions of § 10.20(j), the general provision that governs the availability of material submitted to the Dockets Management Branch, such as petitions, comments, and objections.

Proposed § 101.69(h) requires all petitions to include either a claim for a categorical exclusion under § 25.24 or an environmental assessment under § 25.31. Section 101.69(i) sets forth how the submitted data in the petition are to be organized and identified and permits the petitioner to incorporate by reference any data from an earlier petition. Section 101.69(j) requires that the petition be signed by the petitioner, or his attorney or agent, or (if a corporation) by an authorized official. Section 101.69(k) requires that the petition include a statement signed by the person responsible for the petition that the petition is a representative and balanced submission containing all information, favorable and unfavorable, to the evaluation of the proposed claim. Section 101.69(l) states that all applicable provisions of part 10 may be used by the agency, the petitioner, or any outside party with respect to any agency action on a petition submitted under this section. The agency advises, however, that actions requested under part 10, e.g., a request for reconsideration of a decision on a § 101.69 petition, are not subject to the timeframes prescribed in the 1990 amendments for the petitions themselves.

2. Provisions for Descriptor Petitions

Proposed § 101.69(m)(1) sets forth the proposed data requirements specific to descriptor petitions. These requirements are, in FDA's opinion, those necessary for the petition to demonstrate that use of the proposed descriptor is not misleading and is consistent with the purpose of the 1990 amendments, i.e., to make the food label more meaningful and understandable to consumers.

Proposed format item A requires a statement identifying the descriptive term and the nutrient whose level the term is intended to characterize. The statement should address why the use of the term as proposed will not be misleading and provide examples of the claim as it will be used on labels or labeling, as well as examples of the types of foods on which the claim will be used. The statement must specify the level at which the nutrient must be present, or what other conditions concerning the food must be met for the appropriate use of the term, as well as any factors that would make the use of the term inappropriate.

Proposed format item B requires a detailed explanation, supported by any necessary data, of why the food component characterized by the claim is of importance in human nutrition by virtue of its presence or absence at the levels that the claim would describe. The explanation must also state what nutritional benefit to the public will derive from the use of the claim as proposed, and why such benefit is not available through the use of existing terms defined by regulation. The explanation of any claim proposed for a specific group within the population should address the specific nutritional needs of that group. This format item also requires the petitioner to provide data and information, to the extent necessary, to demonstrate that consumers can be expected to understand the meaning of the term under the proposed conditions of use.

Proposed format item C requires data showing the amount of the subject nutrient that is present in the types of foods for which the claim is intended and specifies requirements for the assay methods used for these determinations. This information is necessary to assure the agency that the claim is realistic, and that there are foods that will actually be able to bear the claim.

Proposed format item D requires a detailed analysis of the potential effect of the use of the proposed claim on food consumption and of any corresponding changes in nutrient intake, with the latter item specifically addressing the intake of nutrients that have beneficial and negative consequences in the total diet. If the claim is intended for a specific group within the population, the analysis must address the dietary practices of that group, with data sufficient to demonstrate that the dietary analysis is representative of that group.

The procedures for agency handling of the petition are set forth in proposed § 101.69(m)(2) through (m)(4). These items reflect the timeframes in the act for agency action on descriptor petitions. Further, the agency is proposing for descriptor petitions (and also synonym and brand-name petitions) to notify the petitioner of receipt of a petition within 15 days of submission and to deny the petition at such time if it is incomplete. If a petition is not denied at this time, a docket number will be assigned to the petition, and any subsequent actions under the provisions of Part 10—Administrative Practices and Procedures regarding the petition will reference that docket number.

3. Provisions for Synonym Petitions

Proposed § 101.69(n)(1) sets forth the proposed data requirements specific to synonym petitions. These requirements are, in FDA's opinion, those necessary for the petition to demonstrate that use of the proposed synonym is not nsleading and is consistent with the purpose of the 1990 amendments. Because the agency foresees using many of the same criteria in evaluating a synonym petition as it is proposing to use for descriptor petitions, many of the proposed data requirements for synonym petitions are similar or identical to those proposed for descriptor petitions.

Proposed format item A requires a statement identifying the synonymous term and the nutrient content claim (defined by a regulation) with which the synonym is claimed to be consistent. The statement should address why the use of the synonymous term, as proposed, will not be misleading. The statement should also provide examples of the claim as it will be used on labels or labeling, as well as examples of the types of foods on which the claim will be used. The statement must specify whether any limitations not applicable to the use of the defined term are intended to apply to the use of the synonymous term.

Proposed format item B requires a detailed explanation, supported by any necessary data, of why the proposed term is requested, including an explanation of whether the existing defined term is inadequate for the purpose of effectively characterizing the level of a nutrient. The explanation must also state what nutritional benefit to the public will derive from the use of the claim as proposed, and why such benefit is not available through the use of existing terms defined by regulation. Any claim proposed for a specific group within the population should address the specific nutritional needs of that group. This format item also requires data and information to the extent necessary to demonstrate that consumers can be expected to understand the meaning of the term under the proposed conditions of use.

Proposed format item C requires a detailed analysis of the potential effect

of the use of the proposed claim on food consumption and of any corresponding changes in nutrient intake, with the latter item specifically addressing the intake of nutrients that have beneficial and negative consequences in the total diet. If the claim is intended for a specific group within the population, the analysis must address the dietary practices of that group, with data sufficient to demonstrate that dietary analysis is representative of that group.

The proposed procedures for agency handling of a synonym petition are set forth in proposed § 101.69(n)(2) through (n)(4). These items reflect the timeframes in the act for agency action on synonym petitions. The agency is not proposing to provide for the publication of a notice soliciting public comment on the petition because, in contrast to petitions for new descriptors, the statute does not require such notice for synonym petitions, and under the statutory requirement of action on the petition in 90 days, there simply is not time to do so. Consistent with the act, the agency is proposing to issue its decision concerning a synonym petition by letter to the petitioner.

Although the act does not require that permission to use a synonym be provided by regulation, the agency is proposing that it will publish expeditiously a notice of its decision on the petition. Such notice will serve to inform the public of agency decisions and provide an opportunity for interested persons to petition the agency for reconsideration of the action under part 10. In addition, to avoid confusion about which synonymous terms have been approved by the agency, and because the procedure defined in the statue will result in a final agency decision that has the force and effect of law, FDA is proposing that when a synonym petition is granted, it will include the synonymous term in the applicable descriptor regulation.

4. Provisions for Brand-Name Petitions

Proposed § 101.69(o)(1) sets forth the proposed data requirements specific to brand-name petitions. These requirements are, in FDA's opinion, those necessary for the petition to demonstrate that use of the proposed implied claim is not misleading and is consistent with the purpose of the 1990 amendments. Because the agency foresees using many of the same criteria in evaluating a brand-name petition as it is proposing to use for descriptor and synonym petitions, many of the proposed data requirements for brand-name petitions are similar or identical to those proposed for descriptor and synonym petitions.

Proposed format item A requires a statement identifying the implied nutrient content claim, the nutrient the claim is intended to characterize, the corresponding term for characterizing the level of the nutrient as defined by regulation, and the brand-name of which the implied claim is intended to be a part. The statement should address why the use of the brand-name as proposed will not be misleading. The statement should provide examples of the types of foods on which the brand-name will appear and must include data showing that the actual level of the nutrient in these foods qualifies them to bear the term defined by regulation.

Proposed format item B requires a detailed explanation, supported by any necessary data, of why use of the proposed brand-name is requested. This format item must also state what nutritional benefit to the public will derive from the use of the proposed brand-name. If the branded product is intended for a specific group within the population, the claim should address the specific nutritional needs of that group.

Proposed format item C requires a detailed analysis of the potential effect of the use of the proposed brand-name on food consumption and of any corresponding changes in nutrient intake, with the latter item specifically addressing the intake of nutrients that have beneficial and negative consequences in the total diet. If the branded product is intended for a specific group within the population, the analysis must address the dietary practices of that group, with data sufficient to demonstrate that dietary analysis is representative of that group.

The proposed procedures for agency handling of a brand-name petition are set forth in proposed § 101.69(o)(2) through (o)(5). These items reflect the timeframes in the act for agency action on brand-name petitions.

FDA recognizes that a short timeframe for brand name decisions is necessary in order to prevent inappropriate inhibition of production and marketing planning. Given the need for such planning and the need to ensure that the consumer is protected, the agency recognizes the need for it to make decisions on implied nutrient content claims in brand names within the 100 day timeframe.

The agency advises that it intends to deny a petition if it determines that the requested claim is not an implied nutrient content claim. FDA will make this determination using criteria consistent with any that have been developed for implied claims under section 403(r) of the act. The agency also intends to deny petitions for implied claims that do not include as a part of the label statement enough appropriate information so that it is clear that consumers will not be misled by the claim. In addition, FDA intends to deny a petition if it is not complete as prescribed in this regulation, or if the information in the petition is not clearly persuasive that the requested claim should be approved. Of course, as discussed above, any petitioner may request reconsideration of a denial under the provisions of 21 CFR part 10.

The agency is proposing to publish the **Federal Register** notice seeking comment on the petition as soon as possible after receipt of the petition (probably within 20 days) and to provide 30 days for public comment on the petition. The agency believes that 30 days is the longest comment period possible consistent with the agency's responsibility to act on the petition within 100 days. Consistent with the act, the agency is proposing to issue its decision concerning a brand-name petition by letter to the petitioner. However, to avoid confusion about which brand-names containing implied nutrient content claims have been approved by the agency, FDA is proposing that when a brand-name petition is granted, it will publish expeditiously a notice in the **Federal Register** informing the public of the granting of the petition.

As with synonym petition proceedings, the rulemaking prescribed by for implied nutrient content claims in brand names will result in binding final agency decisions. However, FDA does not plan to list approved brand name claims in the regulations. Unlike approved synonyms, which are available for use by any manufacturer of a qualifying food, approved brand name claims are proprietary and can be used by only one firm. Consequently, there is less need for a list of approved brand name claims in the Code of Federal Regulations than there is for a list of approved synonyms. However, there is a need for a publicly available, up-to-date list, and FDA intends to maintain such a list.

VI. Terms That Describe Other Aspects of Food

In the course of the Secretary's labeling initiative, another matter that has increasingly gained the attention of consumers, the food industry, and the agency is the use of terms such as "fresh," "natural," and "organic" on labels or in labeling. These terms are not used to characterize the level of a nutrient in a food but rather to describe other aspects of a food that are

considered desirable. Many comments to the 1989 ANPRM objected to the use of such terms as marketing tools that provide no consistent guidance to the consumer about the nature of the food. Some comments suggested that these terms should be defined by FDA or not permitted.

Because such terms are not used to make nutrient content claims, the 1990 amendments do not require that the Secretary define such terms. However, the agency believes that the misuse of "fresh" and related terms that has occurred in the marketplace necessitates that a definition be established in the labeling regulations to provide a basis for consumers to distinguish foods that have certain desirable attributes from those that do not and to remove any inconsistencies in the use of the term that may remain in the marketplace. The agency announced its intention to take such action with respect to "fresh" in a notice published in the Federal Register on February 12, 1991 (56 FR 5894). It also discussed the interim enforcement policy it planned to use until such rulemaking is completed.

FDA is proposing to amend its food labeling regulations to define, and to provide for the appropriate use of, the terms "fresh," "freshly ____," and "fresh frozen" ("frozen fresh") in the labeling of foods. FDA is also addressing the terms "natural" and "organic." However, as explained below, it is not proposing to establish definitions for the latter terms at this time.

A. "Fresh" and Related Terms

1. Use of the Term "Fresh" on Food Labels

a. *Previous FDA findings on use of the terms "fresh" and "fresh frozen" ("frozen fresh").* The agency's longstanding position on the appropriate use of the terms "fresh" and "fresh frozen" is set forth in Compliance Policy Guide (CPG) 7120.06 (Ref. 50). CPG 7120.06 makes two basic points: (1) "fresh" should not be used to describe foods that have been subjected to any form of heat or chemical processing; and (2) "frozen fresh" or "fresh frozen" are examples of terms appropriate for referring to foods that were quickly frozen while still fresh. FDA's position has been and continues to be that use of term "fresh" on foods that have been frozen or subjected to heat or chemical processing (e.g., canning, cooking, baking, pasteurization, smoking, or use of a preservative) is false and misleading.

The agency's position on the use of "fresh" dates back to the 1940s. In TC–71 (February 19, 1940) the agency stated that it would not take exception to such terms as "frozen fresh" on packaged frozen foods, provided that the foods are actually fresh when frozen. In TC–99 (February 21, 1940), FDA stated that the word "fresh" is generally understood by consumers to mean an article of recent origin, and that for butter the word would be appropriate only if the butter had been recently churned. The agency said that "fresh" would not be applicable to butter that had been kept for a length of time, such as in the usual commercial practice of storing butter in cold storage warehouses until it is marketed. In TC–281 (May 7, 1940), FDA stated that the term "fresh tomato juice" should not be applied to the ordinary canned products.

The agency has reiterated its policy over the years. FDA took a consistent position in the findings of fact that it published in the Federal Register of October 11, 1963 (28 FR 10900), with the final order establishing definitions and standards of identity for orange juice and various orange juice products, including pasteurized orange juice and orange juice from concentrate. One of the primary reasons for promulgating these standards was the misrepresentation of reconstituted and pasteurized orange juice as "fresh" orange juice. Finding of fact No. 2 stated:

> Fresh orange juice is not a suitable name for the commercially packaged expressed juice of oranges. The housewife who for many years has squeezed oranges knows this juice to be orange juice. The term "fresh" is ambiguous in that it is difficult to determine and to draw the line when a product is fresh and when it is no longer fresh. The use of the term "fresh" on commercially packed orange juice or orange juice products would tend to confuse and mislead consumers.

The findings of fact contain other similar and related comments concerning "fresh." Finding of fact No. 17 stated in part:

> The problem most encountered * * * is the adulteration of orange juice products with water and sugar. The next most frequent problem is misrepresentation of reconstituted orange juice and of pasteurized orange juice as fresh orange juice. The investigation further showed that even managers of retail food stores over the country are confused concerning the identity of various single-strength orange juice products. There is general confusion in the area.

The issuance of standards of identity for various orange juice products was intended, in part, to prescribe specific appropriate names for heat treated and reconstituted orange juice so as to eliminate confusing these products with fresh orange juice.

FDA has also stated in an informal opinion letter (Ref. 50) that irradiated food is a processed food and thus could not appropriately be labeled as "fresh."

b. *Current practices of concern to FDA.* Beginning in the late 1980s FDA received a number of complaints about the deceptive use of the term "fresh" on products (e.g., pasta sauce) that were preserved by heat treatment or products (e.g., fruit juices) that had been concentrated and reconstituted. FDA grew concerned about the proliferation of such misleading label claims and the resultant consumer confusion in the marketplace. In the agency's view, it is important that label statements using the terms "fresh" and "fresh frozen" ("frozen fresh") not convey a misleading impression about the food.

The IOM report (Ref. 5) took a consistent view. It noted that consumers want and expect a product's principal display panel to include short and understandable terms such as "fresh" and "fresh frozen" ("frozen fresh") that describe certain desirable characteristics of the food, because such terms allow them to select quickly foods that they believe are consistent with their dietary concerns. However, the report stated, the lack of uniform and consistent FDA and USDA definitions for these types of terms has led some to conclude that such terms should not be permitted because of the potential for confusion, exaggeration, and deception. Therefore, the IOM report recommended that terms like "fresh" be controlled by narrowing the conditions for their use.

FDA agrees with the recommendations of the IOM report and the general view expressed in many of the comments on the 1989 ANPRM that stronger control of the use of the terms "fresh" and "fresh frozen" ("frozen fresh") is needed so that consumers will not be misled in attempting to make intelligent use of factual information on the food label.

Since 1989, FDA has increased its surveillance of the use of the term "fresh" in the marketplace. In the spring of 1991, the agency instituted a major regulatory initiative against misleading uses of "fresh" on food labels. The agency took formal and informal actions against the use of the term on such products as juice products made from concentrate, juice drinks containing preservatives, and heat processed products such as pasta sauces and caviar. FDA issued letters to several firms citing their misleading use of "fresh" on food labels, warned firms that such misbranded products may be seized by the agency, and has seized some products.

The agency will continue to monitor the use of this term in the marketplace and remains prepared to take action where it encounters the misleading use of the term. However, FDA also believes that the lack of regulations defining "fresh" and "freshly frozen" ("frozen fresh") creates the possibility that these terms will again be abused. Therefore, FDA has tentatively concluded that it is both necessary and desirable to establish definitions by regulation that will standardize the use of these terms on food labels.

2. Proposed Regulation

a. *Legal basis and general provisions.* FDA is proposing to define the terms "fresh" and "fresh frozen" ("frozen fresh") in the labeling of food and to provide for the proper use of these terms. FDA has authority to take these actions under sections 201(n), 403(a)(1), and 701(a) of the act. Section 201(n) of the act allows for the consideration of the extent to which the labeling of a food fails to reveal a material fact in determining whether its labeling is misleading. Section 403(a)(1) of the act states that "A food shall be deemed to be misbranded if its labeling is false or misleading in any particular," and section 701(a) of the act vests the Secretary (and by delegation, FDA) with authority to issue regulations for the efficient enforcement of the act. If this proposal becomes a final rule, foods using these terms will be considered to be misbranded if they are not labeled in accordance with the proposed definitions.

FDA is proposing to redesignate subpart F of part 101 as subpart G and to establish a new subpart F that will contain requirements for claims that are neither nutrient content claims nor health claims. FDA is proposing to define and provide for the use of the terms "fresh," "freshly ____" (the blank to be filled with an appropriate verb such as "prepared," "baked," or "roasted"), and "fresh frozen" in § 101.95. The introductory paragraph of proposed § 101.95 sets out the general requirements for the use of the terms defined in the section, namely that they may be used on the label or in labeling of a food only in conformity with the provisions of the section.

b. *"Fresh," and "Freshly ____."* FDA is proposing to define the terms "fresh" and "freshly ____," to be used in separate contexts: (1) The term "fresh," as defined in proposed § 101.95(a), applies to a raw food that has not been frozen or subjected to any form of thermal processing or any other form of preservation; (2) The term "freshly ____" (e.g., prepared, baked, roasted) in proposed § 101.95(b) applies to a recently produced or prepared food that has not been frozen, or subjected to any form of thermal processing or any other form of preservation, during or subsequent to its manufacture or preparation, excluding a process inherent to the production of the basic product. As discussed below, proposed § 101.95(d) contains provisions for the use of these descriptors in cases that would otherwise be precluded under the definitions in § 101.95 (a) and (b).

FDA believes that consumers generally regard a food in its raw state as being fresh. Proposed § 101.95(a) therefore distinguishes a food in its raw state from the same food that has been processed or preserved for the purpose of defining which is fresh. For example, fish that is caught, cleaned, and displayed for sale under refrigeration may be labeled "fresh." However, if the fish was frozen aboard the fishing vessel, then thawed and prepared for sale in a central facility, it could not be labeled as "fresh" because it has been processed by freezing. A food such as unprocessed juice obtained directly from oranges by squeezing may be labeled as "fresh." However, if the juice is pasteurized, it is not fresh because it has been processed by pasteurization (a thermal process). Similarly, a product made with processed or concentrated ingredients is not "fresh."

Under proposed § 101.95(d)(1), the following conditions would not preclude use of the term "fresh": (1) If an approved wax or coating has been applied to raw produce, (2) if a mild chlorine or mild acid wash has been applied to raw produce, or (3) if raw produce has been treated with approved pesticides after harvest. Although these practices could possibly be viewed as methods of preserving food, they are routine practices in the distribution and handling of raw produce that essentially affect only the food surface and do not appreciably affect the body of the food or alter its raw state. Further, the agency believes that consumers regard such foods as fresh and are not misled when the term is used on these foods.

The agency solicits comments on the use of "fresh" to describe certain raw foods that have been treated with ionizing radiation in accordance with § 179.26 (21 CFR 179.26), specifically those foods for which irradiation at a maximum dose of 1 kiloGray (100 kilorads) is permitted. Currently, § 179.26(b) permits such treatment "for control of *Trichina spiralis* in pork carcasses," "for growth and maturation inhibition of fresh foods," and "for disinfestation of arthropod pests." The agency will determine, based on the comments, whether it should include a provision in § 101.95(d)(1) permitting the term "fresh" to be used on irradiated foods where the irradiation has had little effect on the attributes of the food associated with its raw state. Alternatively, if comments persuade the agency that consumers would be misled by such use of the term "fresh," the agency will consider including a provision in the final rule specifically prohibiting such practices.

Proposed § 101.95(d)(2) provides that refrigeration of a raw food that otherwise meets the definition of "fresh" does not preclude the use of that term. Although refrigeration is a means of preserving food for a finite time, the proposal includes this provision because the agency believes that consumers generally regard refrigerated raw foods as fresh and are not misled when the term is used on such foods.

Proposed § 101.95(b) states conditions for the use of "freshly ____" on labels and in labeling of prepared foods, e.g., soup and bread, as opposed to raw food items. Proposed § 101.95(d)(2) also provides that refrigeration of a food that otherwise meets the definition of "freshly ____" does not preclude the use of the term "freshly ____." In the case of prepared foods, FDA recognizes that recently prepared or produced foods that have not been processed or otherwise preserved are valued by consumers and are generally considered by consumers to be more desirable than comparable foods that have been processed or preserved. Examples of such valued foods would include salads (e.g., bean salad and tuna salad) or soups (e.g., clam chowder) that are prepared in a retail outlet or a central facility, packaged in a consumer package or bulk form without preservatives, and offered quickly for sale without further processing. The agency believes that it is appropriate to label such foods as "freshly prepared" or "freshly made" to emphasize that the food is of recent origin, is not preserved, and has not been processed after preparation. "Prepared" in this context means that the salad or soup was actually formulated from a recipe, versus simply transferring a canned salad to a tray and displaying it for sale in a refrigerated case, or simply heating a canned soup and offering it from a self-service soup bar.

Other examples of foods that meet the proposed definition in § 101.95(b) include: (1) Peanuts that are roasted and sold onsite; (2) shrimp that is steamed at a retail site or at a central facility and quickly offered at retail; and (3)

crabmeat that is steamed or broiled before picking and is sold without preservation. In these cases, the use of other verbs in conjunction with the adverb "freshly" would be appropriate, such as "freshly roasted peanuts," "freshly steamed shrimp," and "freshly picked crabmeat." It should be noted that in all the examples for proposed § 101.95(b), the term "freshly" is an adverb that modifies a verb such as "prepared" or "roasted," and does not describe the food itself as fresh. The agency believes that the proposed terminology is the most appropriate manner for conveying the desirable attributes of recently prepared or produced foods, and thus, it is not proposing to allow for the use of "fresh" to describe the food itself.

Under the proposed definition, recently baked bread, formulated without a chemical preservative, could be labeled as "freshly baked." The fact that the bread was processed by baking does not disqualify it because baking is inherent to the manufacturing of bread. However, if such a product included a chemical preservative, such as a mold growth inhibitor, among its ingredients, it could not be labeled as "freshly baked" because it would be a preserved product. The agency does not believe that the preserved product should bear the same qualitative term, i.e., "freshly baked," as unpreserved bread, because its quality results, in part, from the incorporation of a chemical preservative.

The term "recently" as used in this proposal is a qualitative term whose meaning depends in large degree on the food in question. For example, many consumers would consider a pasta salad to be recently made, and thus "freshly prepared," on the day it was actually prepared on-site or in a central facility. On the other hand, for "freshly roasted" peanuts, consumers would probably consider "recent" to mean that the peanuts are still warm. However, in general, FDA believes that it would not be appropriate for the terms permitted by proposed § 101.95(b) to be used on the label or labeling of a food that is available for sale more than 24 hours after its preparation. FDA has therefore included in proposed § 101.95(d)(3) a provision that states that a food shall not be considered to be recently prepared or made if it is available for sale more than 24 hours after its preparation or production.

The agency's intention in specifying a time period for "recently prepared" is to limit the use of the term "freshly ____" to foods that are qualitatively comparable to foods prepared by consumers for same day consumption. However, the agency realizes that given the variety of foods that are available for sale within a relatively short time after preparation, some foods available for sale more than 24 hours after preparation may merit use of the term "freshly ____." The agency requests comments on this matter. Comments should identify such foods and state why they merit use of the term "freshly ____." If the comments identify such foods, FDA will consider adding provisions to § 101.95(d) that will permit the use of "freshly ____" in the labeling of such foods. Alternatively, the agency would consider specifying a time period other than 24 hours in § 101.95(b) if the comments demonstrate that there are a large number of foods that merit such an exception, and that a more appropriate time period can be included in § 101.95(b).

The proposed definition of "freshly ____" in proposed § 101.95(b) will preclude the use of this term on foods that have been subjected to certain processes and any form of preservation "during or subsequent to" the preparation or production of the food. Thus, the focus of this definition is on the preparation of the product and subsequent treatment of the food item and not on to the ingredients contained in the product. FDA believes that it is common in the marketplace to find prepared foods that are valued for their recent preparation even though they contain processed ingredients, e.g., a pasta salad made with canned tuna. Thus, the agency believes that consumers will not be mislead by permitting such foods to bear terms such as "freshly prepared." However, the agency requests comments concerning whether situations exist in which it would be misleading to label a prepared food containing processed ingredients as "freshly ____." If such cases are identified in the comments, the agency will consider restricting the use of the term to situations where it would not be misleading.

FDA's proposed approach concerning ingredients in a freshly prepared food is generally consistent with the policy of the USDA's Food Safety and Inspection Service (FSIS). FSIS, which regulates meat and poultry based products, permits the use of the term "fresh" when it describes a recently prepared food consisting of ingredients that could not meet its policy criteria (e.g., a ham salad containing cured ham).

c. *"Fresh frozen" and "frozen fresh".* As noted above, it has been the agency's longstanding policy that the term "fresh" should not be used without qualification to describe foods that are frozen or have been frozen. Consistent with this policy, the agency is proposing in § 101.95(c) to define the terms "fresh frozen" and "frozen fresh," when used on the label of a food, to mean a food that is quickly frozen while fresh (i.e., a food that is recently harvested when frozen), by a freezing system such as blast-freezing (sub-zero Fahrenheit temperature with fast moving air directed at the food) that ensures the food is frozen quickly, even to the center of the food, and that virtually no deterioration has taken place.

d. *Use of terms in a brand name or as a sensory modifier.* FDA is aware of a number of foods that include as part of the brand or firm name the term "fresh." Brand names, firm names, logos, and mottos are label statements that sometimes make a false or misleading claim and have the potential to mislead. Some manufacturers have claimed that when the term is used as a brand name or with the word "brand" or "style," it is not subject to FDA regulation. Others have sought to insulate their use of the term "fresh" by using it to refer to sensory qualities such as texture, color, flavor, or taste.

The use of this descriptor in conjunction with one of these terms or similar terms is misleading to consumers on the label of a product that is not itself fresh. For example, some traditional canned vegetables have used such labeling in the past, where the product contains ingredients that enable it to undergo a less intense thermal process and to retain a higher level of sensory quality. The agency desires to make it clear that it regards any use of the terms defined in this section to be subject to the requirements of the regulation if the term expressly or implicitly refers to the food. FDA is, therefore, proposing to include in the introductory paragraph in § 101.95 a statement that the requirements of the section pertain to any use of the subject terms that expressly or implicitly refer to the food, on labels or labeling, including use in a brand name and use as a sensory modifier.

e. *Use of fresh ingredients in processed foods.* FDA is also considering whether a processed food made from fresh, as opposed to processed, fruits or vegetables should be permitted (by regulation) to include on the label a factual statement such as "spaghetti sauce—made with fresh mushrooms" FDA requests comments on whether use of the term "fresh" is appropriate in such circumstances.

FDA also requests comments on whether consumers understand such

statements and consider them to be useful in describing a processed product, whether it is important to the consumer to be able to distinguish between processed products made from fresh as opposed to processed (e.g., concentrated and then rehydrated or reconstituted) ingredients, and whether there are other appropriate means for making such distinctions on food labels. In addition, if designation of the ingredient as "fresh" is useful, FDA requests comments on whether the inclusion of blanching as a part of a continuous process at a facility should preclude labeling the ingredient as "fresh." For example, if fresh raw material mushrooms are blanched and then added to the product in a continuous process, should the label be permitted to bear the phrase "made with fresh mushrooms"? FDA will consider the comments it receives and determine whether to include a provision in the final rule addressing use of the term "fresh" to describe ingredients in processed foods.

An issue that has come to the agency's attention in its review of "fresh" claims is the use of remanufactured ingredients. The agency solicits comments on whether the use of remanufactured ingredients affects the attributes of a finished product, such as a tomato product, to such a degree that the consumer is misled about the product if its labeling does not specifically declare the remanufactured nature of the ingredient. For example, would it be useful to consumers for processed products made from remanufactured ingredients to bear a term on its principal display panel such as "made from ____ concentrate," "remanufactured," or "reconstituted?"

If the comments persuade the agency that such a declaration on the product's principal display panel is necessary to not mislead consumers about the nature of a product, the agency will consider including a provision in the final rule requiring such a declaration.

f. *Extended shelf life foods.* Extended shelf life (ESL) is a term that describes a category of foods made possible by relatively recent developments in food processing and packaging technology. Generally, ESL describes a food that is unprocessed or minimally processed (in some cases, the product is cooked just as it would be by a consumer), and thus is not shelf stable, but that is packaged in such a manner so as to maintain its quality for an extended period of time when compared to traditional packaging methods. Such products are often refrigerated (many require refrigeration for safe distribution) and often rely on the use of "barrier" packaging and "modified or controlled atmospheres" in the package to retard aging of the food. For example, one such pasta product packaged in a barrier container with a modified atmosphere, reportedly has a refrigerated shelf life of 34 days (Ref. 52).

FDA notes that ESL do not meet the requirements of § 101.95(b) for the use of the term "freshly ____." However, FDA recognizes that such products may be of a degree of quality similar to that of traditional prepared foods that could appropriately be labeled as "freshly ____." FDA is requesting information on ESL foods that would enable it to determine whether any foods of this type merit use of the term "freshly ____," and if so, what factors about such foods justify the use of the term in a nonmisleading manner. If the comments identify nonmisleading uses of the term "freshly ____" to describe ESL foods, the agency will consider explicitly limiting the proposed definition in § 101.95(b) to foods prepared and packaged by traditional means, and it will consider including provisions in the final rule permitting the use of the term "freshly ____" or other terms to describe foods prepared and packaged using ESL techniques.

B. Natural

The word "natural" is often used to convey that a food is composed only of substances that are not manmade and is, therefore, somehow more wholesome. In the past, FDA has not attempted to restrict use of the term "natural" except for added color, synthetic substances, and flavors under § 101.22. In its informal policy (Ref. 53), the agency has considered "natural" to mean that nothing artificial or synthetic (including colors regardless of source) is included in, or has been added to, the product that would not normally be expected to be there. For example, the addition of beet juice to lemonade to make it pink would preclude the product being called "natural."

The meaning and use of the term "natural" on the label are of considerable interest to consumers and industry. Data suggest that uses of "natural" claims are confusing and misleading to consumers and frequently breach the public's legitimate expectations about their meaning. For example, two FTC reports (Refs. 54 and 55) cite numerous studies indicating a general lack of consumer understanding and scientific agreement about the meaning of the term.

The term "natural" is used, however, on a variety of products to mean a variety of things. Because of its widespread use, and the evidence that consumers regard many uses of this term as non-informative, the agency is considering establishing a definition for this term. FDA believes that if the term "natural" is adequately defined, the ambiguity surrounding use of the term that results in misleading claims could be abated.

In considering this issue, FDA has reviewed definitions of the term "natural" used by other government agencies, other countries, state governments, and industry. For example, USDA permits the use of the term "natural" on the labeling of meat and poultry products if: (1) They contain no artificial flavor or flavoring, coloring ingredient, chemical preservative, or any other artificial or synthetic ingredient, and (2) they and their ingredients are not more than "minimally processed." "Minimally processed" may include traditional processes such as smoking, roasting, freezing, drying, and fermenting. It may also include those processes that do not fundamentally alter the raw product and that only separate a whole, intact food into component parts such as grinding meat or pressing fruits to produce juices. Solvent extraction, acid hydrolysis, chemical bleaching, and other such relatively complex processes do not meet the criteria for minimal processing, and, thus, if they have occurred, the product would not be allowed by USDA to be labeled as "natural" (Ref. 56).

USDA's policy also provides that all labels of meat and poultry products bearing the term "natural" must be accompanied by a brief statement informing consumers that the product is natural because it contains no artificial ingredients and is only minimally processed. This statement may appear either directly beneath or beside all natural claims or may be placed elsewhere on the principal display panel provided an asterisk is used to tie the explanation to the claim. USDA has approved labels for "All Natural Wingettes" and "All Natural Chili."

Some of the definitions established by other government agencies, other countries, state governments, and industry are more restrictive than the USDA definition, while others are less so. There are numerous inconsistencies among the definitions as well as unanswered questions. Consequently, FDA has concluded that more consumer and industry input is needed before it can develop a definition for "natural." However, the agency notes that after considerable input from various groups, including scientists, consumers, industry, and regulatory professions, the

Federal Trade Commission (FTC) was unable to establish a definition for "natural." (See Refs. 54 and 55 and 48 FR 23270, May 24, 1983—Termination of rulemaking proceeding).

One possible meaning of the term "natural" as it applies to food is the absence of artificial or synthetic ingredients of any kind. This meaning, however, has been degraded by inappropriate use of the term in the marketplace. Should FDA establish a meaningful definition for "natural" so that this term has a common consumer understanding? Because of the multiple and diverse meanings currently in use, establishing a definition for the term "natural" that will be readily accepted and understood will be difficult. The agency is seeking comments on whether it should define this term or should prohibit such claims entirely on the grounds that they are false or misleading.

In reaching a decision on any future FDA course of action, the agency seeks comments on how, or if, it should proceed in developing a definition for the term "natural." FDA is particularly interested in the views of consumers and industry on how "natural food" should be defined. Given past consumer confusion on what "natural" means, FDA seeks comments that provide examples of what a natural food is. In addition, FDA seeks comments on whether a food represented to be natural should be considered to be misbranded under section 403(a) of the act: (1) If it has undergone more than "minimal processing" (the agency also requests comments on what "minimal processing" means), or (2) if it contains any artificial or synthetic ingredients such as food and color additives.

How FDA proceeds will depend largely on response to the agency's concerns regarding a definition of the term "natural" and the identification of a suitable direction that the agency might explore in establishing a definition for such a term.

In addition to information on these broad uses of the term "natural," FDA is also seeking comment on how it distinguishes between artificial and natural flavors in § 101.22. The agency is concerned that its existing definition of "natural flavor" may not be consistent with the current interpretation of "natural" as implying minimal processing. For example, while removing the essential oil from a food is probably well understood to be minimal processing, and the oil is therefore a natural flavor of the food, it is less clear whether hydrolysis or enzymolysis of a food is minimal processing and therefore results in a natural flavor. The agency requests comments with substantiating information to provide a basis for a clearer, more appropriate distinction between natural and artificial flavors.

C. Organic

A review of the comments from consumers to the 1989 ANPRM on the use of the term "organic" demonstrated that consumer perceptions of the term encompass more than is generally intended by the term. Many of the comments suggested that they wanted either:

(1) Organic to mean "pesticide free" (organically grown) food;

(2) Label declaration of any pesticide, growth enhancer, fungicide, chemical, or radiation used; or

(3) At least label declaration of any potentially harmful pesticides and fertilizers used.

On November 28, 1990, Title XXI—Organic Certification, known as the "Organic Foods Production Act of 1990 (OFPA), was enacted as part of the 1990 Farm Bill. The purpose of the statute was:

(1) To establish national standards governing the marketing of certain agricultural products as organically produced products, (2) to assure consumers that organically produced products meet a consistent standard, and (3) to facilitate interstate commerce in fresh and processed food that is organically produced.

The OFPA stated that to be sold or labeled as an "organically produced" agricultural product, an agricultural product must, with certain exceptions, (1) have been produced and handled without the use of synthetic chemicals, (2) not be produced on land to which any prohibited substances, including synthetic chemicals, have been applied during the three years immediately preceding the harvest of the agricultural products, and (3) be produced and handled in compliance with an organic plan agreed to by the producer and handler of such product and the certifying agent.

This statute charges USDA with establishing a certification program for producers and handlers of agricultural products that have been produced using organic methods. In addition, the USDA was instructed to permit each state to implement a State organic certification program for producers and handlers of agricultural products that have been produced using organic methods. The OFPA also established certain requirements under which a processed food could be labeled directly or indirectly as "organically grown."

The OFPA provides that exemptions to certain labeling requirements for processed foods may be made to the extent that the Secretary of Agriculture, in consultation with the National Organic Standards Board and the Secretary of DHHS, determines that they are appropriate.

Because responsibility for regulating use of the term "organic" has been assigned by Congress to USDA, FDA will defer issuing of any regulations governing the term "organic" until USDA has adopted appropriate regulations. At this time, FDA will determine whether any additional regulations governing the term "organic" are necessary.

VII. Economic Impact

The food labeling reform initiative, taken as a whole, will have associated costs in excess of the $100 million threshold that defines a major rule. Therefore, in accordance with Executive Order 12291 and the Regulatory Flexibility Act (Pub. L. 96–354), FDA has developed one comprehensive regulatory impact analysis (RIA) that presents the costs and benefits of all of the food labeling provisions taken together. The RIA is published elsewhere in this issue of the **Federal Register**. The agency requests comments on the RIA.

VIII. Environmental Impact

The agency has determined under 21 CFR 25.24 that this proposed rule is of a type that does not individually or cumulatively have a significant effect on the human environment. The proposed actions pertaining to food labeling meet the criteria in 21 CFR 25.24(a)(11) for exclusion from preparation of any environmental assessment and an environmental impact statement. The proposed regulations pertaining to petitions for nutrient content claims meet the criteria for exclusion described in 21 CFR 25.24(a)(8). Therefore, neither an environmental assessment nor an environmental impact statement is required.

IX. Effective Date

FDA is proposing to make these regulations effective 6 months after the publication of a final rule based on this proposal.

FDA notes, however, that in section 10(a)(3)(B) of the 1990 amendments, Congress provides that if the Secretary of Health and Human Services (the Secretary), and by delegation FDA, finds that requiring compliance with section 403(q) of the act, on mandatory nutrition labeling, or with section 403(r)(2) of the act, on nutrient content claims, 6 months after publication of the final rules in the

Federal Register would cause undue economic hardship, the Secretary may delay the application of these sections for no more than 1 year. In light of the agency's tentative findings in its regulatory impact analysis that compliance with the 1990 amendments by May 8, 1993, will cost $1.5 billion, and that 6 month and 1 year extensions of that compliance date will result in savings that arguably outweigh the lost benefits, FDA believes that the question of whether it can and should provide for an extension of the effective date of sections 403(q) and (r)(2) of the act is squarely raised.

FDA has carefully studied the language of section 10(a)(3)(B) of the 1990 amendments and sees a number of questions that need to be addressed. The first question is the meaning of "undue economic hardship" FDA recognizes that the costs of compliance with the new law are high, but those costs derive in large measure from the great number of labels and firms involved. The agency questions whether the costs reflected in the aggregate number represent "undue economic hardship." Therefore, FDA requests comments on how it should assess "undue economic hardship." Should it assess this question on a firm-by-firm basis, as was provided in the bill that passed the House Committee on Energy and Commerce (H. Rept. 101–538, 101st Cong., 2d sess., 24 (1990)), an industry-by-industry basis, or should it assess this question on an aggregate basis? If the agency should take the latter approach, comments should provide evidence that would permit the agency to make a determination that there is "undue economic hardship" for most companies. FDA also points out that assessing hardship on a firm-by-firm basis would likely be extremely burdensome because of the likely number of requests.

FDA will consider the question of the meaning and appropriate application of section 10(a)(3)(B) of the 1990 amendments as soon as possible after the comment period closes. The agency intends to publish a notice in advance of any final rule announcing how it will implement this section to assist firms in planning how they will comply with the act. The early publication of this notice is to assist firms in avoiding any unnecessary expenses that could be incurred by trying to comply with a compliance date that may cause "undue economic hardship."

X. Comments

Interested persons may, on or before February 25, 1992, submit to the Dockets Management Branch (address above) written comments regarding this proposal. Two copies of any comments are to be submitted, except that individuals may submit one copy. Comments are to be identified with the docket number found in brackets in the heading of this document. Received comments may be seen in the office above between 9 a.m. and 4 p.m., Monday through Friday.

In accordance with section 3(b)(1)(B) of the 1990 amendments, FDA must issue by November 8, 1992, final regulations for nutrient content claims. If the agency does not promulgate final regulations by November 8, 1992, section 3(b)(2) of the 1990 amendments provides that the regulations proposed in this document shall be considered as the final regulations. The agency has determined that 90 days is the maximum time that it can provide for the submission of comments and still meet this statutory timeframe for the issuance of final regulations. Thus, the agency is advising that it will not consider any requests under 21 CFR 10.40(b) for extension of the comment period beyond February 25, 1992. The agency must limit the comment period to no more than 90 days to assure sufficient time to develop a final rule based on this proposal and the comments it receives.

XI. Paperwork Reduction Act

In accordance with the Paperwork Reduction Act of 1980 (44 U.S.C. chapter 35), the provisions of § 101.69 *Petitions for nutrient content claims* relating to submission of petitions to FDA will be submitted for approval to the Office of Management and Budget (OMB). These provisions will not be effective until FDA obtains OMB approval. FDA will give notice of OMB approval of these requirements in the Federal Register as part of any final rule that is based on this proposal.

List of Subjects

21 CFR Part 5

Authority delegations (Government agencies), Imports, Organization and functions (Government agencies).

21 CFR Part 101

Food labeling, Reporting and recordkeeping requirements.

21 CFR Part 105

Dietary foods, Food grades and standards, Food labeling, Infants and children.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, it is proposed that 21 CFR parts 5, 101, and 105 be amended as follows:

PART 5—DELEGATIONS OF AUTHORITY AND ORGANIZATION

1. The authority citation for 21 CFR part 5 continues to read as follows:

Authority: 5 U.S.C. 504, 552, App. 2; 7 U.S.C. 2271; 15 U.S.C. 638, 1261–1282, 3701–3711a; secs. 2–12 of the Fair Packaging and Labeling Act (15 U.S.C. 1451–1461); 21 U.S.C. 41–50, 61–63, 141–149, 467f, 679(b), 801–886, 1031–1309, secs. 201–903 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321–394); 35 U.S.C. 156; secs. 301, 302, 303, 307, 310, 311, 351, 352, 354–360F, 361, 362, 1701–1706, 2101–2672 of the Public Health Service Act (42 U.S.C. 241, 242, 242a, 242l, 242n, 243, 262, 263, 263b–263n, 264, 265, 300u–300u–5, 300aa–1–300ff); 42 U.S.C. 1395y, 3246b, 4332, 4831(a), 10007–10008; E.O. 11490, 11921, and 12591.

2. Section 5.61 is amended by revising the section heading and by adding a new paragraph (g) to read as follows:

§ 5.61 Food standards, food additives, generally recognized as safe (GRAS) substances, color additives, health claims, and nutrient content claims and health claims.

* * * * *

(g) The Director and Deputy Director, Center for Food Safety and Applied Nutrition are authorized to perform all of the functions of the Commissioner of Food and Drugs under section 403(r)(4) of the act regarding the issuing of decisions to grant or deny, letters of filing, notices seeking comment, and notices of proposed rulemaking in response to petitions for nutrient content claims and health claims that do not involve controversial issues.

PART 101—FOOD LABELING

3. The authority citation for 21 CFR part 101 continues to read as follows:

Authority: Secs. 4, 5, 6 of the Fair Packaging and Labeling Act (15 U.S.C. 1453, 1454, 1455); secs. 201, 301, 402, 403, 409, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 331, 342, 343, 348, 371).

4. Section 101.13 is revised to read as follows:

§ 101.13 Nutrient content claims—general principles.

(a) This section and the regulations in subpart D of this part apply to foods that are intended for human consumption and that are offered for sale.

(b) A claim that expressly or implicitly characterizes the level of a nutrient (nutrient content claim) of the type required in nutrition labeling under § 101.9, may not be made on the label or in labeling of foods unless the claim is made in accordance with this regulation and with the applicable regulations in subpart D of this part.

(1) An expressed nutrient content claim is any direct statement about the level (or range) of a nutrient in the food, e.g., "low sodium."

(2) An implied nutrient content claim is any claim that describes the food or

an ingredient therein in such a manner that leads a consumer to assume that a nutrient is absent or present in a certain amount (e.g., "high in oat bran") or that the food because of its nutrient content may be useful in achieving a total diet that conforms to current dietary recommendations (e.g., "healthy").

(3) No nutrient content claims may be made on food intended specifically for use by infants and toddlers less than 2 years of age.

(c) Information that is required or permitted by § 101.9 to be declared in nutrition labeling, and that appears as part of the nutrition label, is not a nutrient content claim and is not subject to the requirements of this section. If such information is declared elsewhere on the label or in labeling, it is a nutrient content claim and is subject to the requirements for nutrient content claims.

(d) A "substitute" food is one that may be used interchangeably with another food that it resembles, i.e., that it is organoleptically, physically, and functionally (including shelf life) similar to, and that it is not nutritionally inferior to unless it is labeled as an "imitation."

(1) If there is a difference in performance characteristics, the food may still be considered a substitute if the label includes a disclaimer adjacent to the most prominent claim as defined in paragraph (j)(2)(ii) of this section, informing the consumer of such difference (e.g., not for use in cooking).

(2) This disclaimer must be in easily legible print or type and in a size no less than one-half the size of the type of the descriptive term but in no case less than one-sixteenth of an inch in height.

(e)(1) Because the use of a "free" or "low" claim before the name of a food implies that the food has been altered compared to other foods of the same type to lower the amount of the nutrient in the food, only foods that have been specially processed, altered, formulated, or reformulated so as to remove the nutrient from the food may bear such a claim (e.g., low sodium potato chips).

(2) Any claim for the absence of a nutrient in a food, or that a food is low in a nutrient, when the food has not been specially processed, altered, formulated, or reformulated to qualify for that claim shall indicate that the food inherently meets the criteria and shall clearly refer to all foods of that type and not merely to the particular brand to which the labeling attaches (e.g., "corn oil, a sodium free food").

(f) A nutrient content claim shall be in type size and style no larger than that of the statement of identity.

(g) The label or labeling of a food for which a nutrient content claim is made shall contain prominently and in immediate proximity to such claim the following referral statement: "See _____ for nutrition information" with the blank filled in with the identity of the panel on which nutrition labeling is located.

(1) The referral statement "See [*appropriate panel*] for nutrition information" shall be in easily legible boldface print or type, in distinct contrast to other printed or graphic matter, that is no less than one-half the size of the type of the nutrient content claim but in no case less than one-sixteenth of an inch in height.

(2) The referral statement shall be immediately adjacent to the nutrient content claim and may have no intervening material other than, if applicable, other information in the statement of identity or any other information that is required to be presented with the claim under this section (see e.g., paragraph (j)(2) of this section or under a regulation in subpart D of this part (see, e.g., §§ 101.54 and 101.62)). If the nutrient content claim appears on more than one panel of the label, the referral statement shall be adjacent to the claim on each panel except for the panel that bears the nutrition information.

(3) If a single panel of a food label or labeling contains multiple nutrient content claims or a single claim repeated several times, a single referral statement may be made. The statement shall be adjacent to the claim that is printed in the largest type on that panel.

(h) In place of the referral statement described in paragraph (g) of this section, if a food contains more than 11.5 grams (g) of fat, 4.0 g of saturated fat, 45 milligrams (mg) of cholesterol, or 360 mg of sodium per reference amount customarily consumed, per labeled serving size, or per 100 grams, then that food must disclose, as part of the referral statement, that the nutrient exceeding the specified level is present in the food as follows: "See [*appropriate panel*] for information about [*nutrient requiring disclosure*] and other nutrients," e.g., "See side panel for information about fats and other nutrients."

(i) Except as provided in paragraph (o)(3) of this section, the label or labeling of a product may contain a statement about the amount or percentage of a nutrient that implies that the food is high or low in that nutrient only if the food actually meets the definition for either "high" or "low" as defined for the nutrient that the label addresses. Such a claim might be, "contains 100 mg of sodium per serving."

(j) Products may bear a statement that compares the level of a nutrient in the product with the level of a nutrient in a reference food. These statements shall be known as "relative claims" and include "reduced," "light" and comparative claims.

(1) To bear a relative claim about the level of a nutrient, the amount of that nutrient in the food must be compared as specified below to a reference food. Such foods are:

(i) For all relative claims, an industry wide norm, i.e., a composite value weighted according to a national market share on a unit or tonnage basis of all the foods of the same type as the food for which the claim is made;

(ii) For reduced and comparative claims only, a manufacturer's regular product that has been offered for sale to the public on a regular basis for a substantial period of time in the same geographic area by the same business entity or by one entitled to use its trade name; or

(iii) For comparative claims only, a food or class of food whose composition is reported in a current valid data base such as U.S. Department of Agriculture's Handbook 8, *Composition of Foods, Raw, Processed, Prepared.*

(2) For foods bearing relative claims:

(i) The label or labeling must bear, immediately adjacent to the claim that is in the most prominent location on the labeling or labeling and in type no less than one-half the size of the type of the claim but no less than one-sixteenth of an inch, the following accompanying information:

(A) The identity of the reference food;

(B) The percentage (or fraction) of the amount of the nutrient in the reference food by which the nutrient has been modified, (e.g., "50% less fat," "⅓ fewer calories"), and

(C) Clear and concise quantitative information comparing the amount of the subject nutrient in the product per labeled serving with that of the reference food.

(ii) The determination of which use of the claim is in the most prominent location on the label or labeling will be made based on the following factors, considered in order:

(A) A claim on the principal display panel adjacent to the statement of identity;

(B) A claim elsewhere on the principal display panel;

(C) A claim on the information panel; or

(D) A claim elsewhere on the label or labeling.

(iii) Relative claims for decreased levels of nutrients may be made on the label or in labeling of a food only if the nutrient content for that nutrient differs

from that of the reference food by more than the amount specified in the definition of "low" for that nutrient.

(k) The term "modified" may be used in the statement of identity of a food that bears a comparative claim that complies with the requirements of this part, followed immediately by the name of the nutrient whose content has been altered (e.g., "Modified fat cheesecake"). This statement of identity must be immediately followed by the comparative statement such as "Contains 35% less fat than _____" and all other information required in paragraph (j)(2) of this section for comparative claims.

(l) For purposes of making a claim, a "meal-type product" shall be defined as a food that:

(1) Makes a significant contribution to the diet by:

(i) Providing at least 200 calories per serving (container); or

(ii) Weighing at least 6 ounces per serving (container); and

(2) Contains ingredients from 2 or more of the following 4 food groups:

(i) Bread, cereal, rice and pasta group;

(ii) Fruits and vegetables group;

(iii) Milk, yogurt, and cheese group;

(iv) Meat, poultry, fish, dry beans, eggs, and nuts group; and

(3) Is represented as, or is in a form commonly understood to be, a breakfast, lunch, dinner, meal, main dish, entree, or pizza. Such representations may be made either by statements, photographs, or vignettes.

(m) Nutrition labeling shall be provided for any food for which a nutrient content claim is made in accordance with §§ 101.9 and 101.36.

(n) Compliance with requirements for nutrient content claim in this section and in regulations in subpart D of this part, will be determined using analytical methodology prescribed for determining compliance with nutrition labeling in § 101.9 of this chapter.

(o) The following exemptions apply:

(1) Nutrient content claims that have not been defined by regulation and that appear as part of a brand name that was in use prior to October 25, 1989, may continue to be used as part of that brand name, provided they are not false or misleading under section 403(a) of the Federal Food, Drug, and Cosmetic Act (the act).

(2) A soft drink that used the term "diet" as part of its brand name before October 25, 1989, and whose use of that term was in compliance with § 105.66 of this chapter as that regulation appeared in the Code of Federal Regulations on that date, may continue to use that term as part of its brand name, provided that its use of the term is not false or misleading under section 403(a) of the act.

(3) A statement that describes the percentage of a vitamin or mineral in the food in relation to a reference daily intake (RDI) as defined in § 101.9 may be made on the label or in labeling of a food without a regulation authorizing such a claim for a specific vitamin or mineral unless such claim is expressly prohibited by regulation under 403(r)(2)(A)(vi) of the act.

(4) The requirements of this section do not apply to:

(i) Infant formulas subject to section 412(h) of the act; and

(ii) Medical foods defined by section 5(b) of the Orphan Drug Act.

(5) A nutrient content claim used on food that is served in restaurants or other establishments in which food is served for immediate human consumption or which is sold for sale or use in such establishments shall comply with the requirements of this section and the appropriate definition in subpart D of this part, except that such claim is exempt from the requirements for disclosure statements in paragraphs (g) and (h) of this section and §§ 101.54(d), 101.62(c), (d)(1)(ii)(C), (d)(2)(ii)(C), (d)(3), (d)(4)(ii)(C), and (d)(5)(ii)(C).

(6) Nutrient content claims that were part of the common or usual names of foods that were subject to a standard of identity on November 8, 1990, are not subject to the requirements of paragraphs (b), (g), and (h) of this section or to definitions in subpart D of this part.

(7) Implied nutrient content claims may be used as part of a brand name, provided that the use of the claim has been authorized by the Food and Drug Administration. Petitions requesting approval of such a claim may be submitted under § 101.50(h).

(8) The terms "sugar free," "sugarless," and "no sugar" may be used on the label and in labeling of chewing gums containing no sucrose provided that when the product is not "low calorie" or "reduced calorie" under § 101.60(b), the label also bear immediately adjacent to the claim each time it is used, the statement "Not a reduced-calorie food," "Not a low calorie food," "Not for weight control," or "Useful Only in Not Promoting Tooth Decay."

5. Subpart D is added to read as follows:

Subpart D—Specific Requirements for Nutrient Content Claims

Sec.

101.54 Nutrient content claims for "source," "high," and "more."
101.56 Nutrient content claims for "light" or "lite."
101.60 Nutrient content claims for the calorie content of foods.
101.61 Nutrient content claims for the sodium content of foods.
101.69 Petitions for nutrient content claims.

Subpart D—Specific Requirements for Nutrient Content Claims

§ 101.54 Nutrient content claims for "source," "high," and "more."

(a) *General requirements.* Except as provided in paragraph (e) of this section, a claim about the level of a nutrient in a food in relation to the Reference Daily Intake (RDI) established for that nutrient in § 101.9(c)(11)(iv) or Daily Reference Value (DRV) established for that nutrient in § 101.9(c)(12)(i), (excluding total carbohydrates and unsaturated fatty aids) may only be made on the label and in labeling of the food if:

(1) The claim uses one of the terms defined in this section in accordance with the definition for that term;

(2) The claim is made in accordance with the general requirements for nutrient content claims in § 101.13; and

(3) The food for which the claim is made is labeled in accordance with § 101.9 or, where applicable, § 101.36.

(b) *"High" claims.* (1) The terms "high," "rich in," or "major source of" may be used on the label and in the labeling of a food except meal-type products as defined in § 101.13(l), provided that the food contains 20 percent or more of the RDI or the DRV per reference amount customarily consumed and per labeled serving size.

(2) These terms may be used on the label and in the labeling of a meal-type product as defined in § 101.13(l), provided that it contains per 100 grams (g) of product, an amount of the nutrient that is equal to 20 percent or more of the RDI or DRV.

(c) *"Source" claims.* (1) The terms "source," "good source of," or "important source of" may be used on the label or in the labeling of a food when the food except meal-type products as described in § 101.13(l) contains 10 to 19 percent of the (RDI) or the (DRV) per reference amount customarily consumed and per labeled serving size.

(2) These terms may be used on the label and in the labeling of a meal-type product as defined in § 101.13(l), provided that it contains per 100 g of product, an amount of the nutrient that is equal to 10 to 19 percent of the RDI or DRV.

(d) *"Fiber" claim.* If a nutrient content claim is made with respect to the level

of dietary fiber, that is, that the product is high in fiber, a source of fiber, or that the food contains "more" fiber, and the food is not low in total fat as defined in § 101.62(b)(2), then the label shall disclose the level of total fat per labeled serving. The disclosure shall appear in immediate proximity to such claim and precede the referral statement required in § 101.13(g) (e.g., "Contains [*x amount*] of total fat per serving. See [*appropriate panel*] for nutrition information.")

(e)(1) *"More."* A comparative claim using the term "more" may be used on the label and in the labeling to describe the level of protein, vitamins, minerals, dietary fiber, or potassium in a food, including meal-type products as defined in § 101.13(l), provided that:

(i) The food contains at least 10 percent more of the RDI for protein, vitamins, or minerals or of the DRV for dietary fiber or potassium (expressed as a percent of the Daily Value) than the reference food that it resembles and for which it substitutes as specified in § 101.13(j)(1)(i), (j)(1)(ii), and (j)(1)(iii);

(ii) Where the claim is based on a nutrient that has been added to the food, that fortification is in accordance with the policy on fortification of foods in § 104.20 of this chapter; and

(iii) As required in § 101.13(j)(2) for relative claims, the identity of the reference food; the percentage (or fraction) that the nutrient was increased relative to the RDI or DRV; and quantitative information comparing the level of the nutrient in the product per labeled serving size, with that of the reference food that it replaces are declared in immediate proximity to the most prominent such claim (e.g., "Contains 10% more of the daily value for fiber than white bread. Fiber content of white bread is 1 g per serving; (this product) 3.5 g per serving.")

(2) A comparative claim using the term "more" may be used to describe the level of complex carbohydrates in a food, including meal-type products as defined in § 101.13(l), provided that the food contains at least 4 percent more of the DRV for carbohydrates than the reference food, and the difference between the two foods is only complex carbohydrates as defined in § 101.9(c)(6)(i). The identity of the reference food and quantitative information comparing the level of complex carbohydrates with that of the reference food that it replaces shall be declared in immediate proximity to the most prominent such claim.

(3) A comparative claim using the term "more" may be used to describe the level of unsaturated fat in a food including meal-type products as defined in § 101.13(l) provided that the food contains at least 4 percent more of the DRV for unsaturated fat than the reference food, the level of total fat is not increased, and the level of *trans* fatty acids does not exceed 1 percent of the total fat. The identity of the reference food and quantitative information comparing the level of unsaturated fat with that of the reference food that it replaces shall be declared in immediate proximity to the most prominent such claim.

§ 101.56 Nutrient content claims for "light" or "lite."

(a) *General requirements.* A claim using the term "light" or "lite" to describe a food may only be made on the label and in labeling of the food if:

(1) The claim uses one of the terms defined in this section in accordance with the definition for that term;

(2) The claim is made in accordance with the general requirements for nutrient content claims in § 101.13; and

(3) The food is labeled in accordance with § 101.9 or, where applicable, § 101.36.

(b) The terms "light" or "lite" may be used on the label and in the labeling without further qualification to describe a food, except meal-type products as defined in § 101.13(l). provided that:

(1) The food has at least a ⅓ (33⅓ percent) reduction in the number of calories compared to a reference food as specified in § 101.13(j)(1)(i) with a minimum reduction of more than 40 calories per reference amount customarily consumed and per labeled serving size;

(2) If the food derives 50 percent or more of its calories from fat, its fat content is reduced by 50 percent or more compared to the reference food that it resembles or for which it substitutes as specified in § 101.13(j)(1)(i) with a minimum reduction of more than 3 grams (g) per reference amount customarily consumed and per labeled serving size; and
